A story is told of a Connecticut Yankee who, when a young man came to him to make application for his daughter's hand in marriage, engaged and held him in conversation about his personal matters, his propects, hopes and fears until the bit of pine stick upon which the suitor had been employing his knife, had dropped in shavings to the ground. He then replied: "Young man, I have known your family for many years, and have always thought well of you, and had you made anything of that stick you have been whittling, even if it had been no more than a tooth-pick, you should have had my girl; but I don't want for a son-in-law one whose tendency is to go through life whittling to no purpose."

How many do we see every day who are wasting their time, spending days, weeks, months and years without profitable result, and often, perhaps we may say nearly always, because they have no fixed purpose in life,—no object at which they aim, no goal to be attained. A few, fortunately, in their younger days have a controlling desire to fill certain positions, or accomplish certain ends. Such are almost sure to succeed, no matter what obstacles may be in the way. A patient and steady struggle with adverse circumstances may be necessary, but an advance step by step, upward and onward, slowly if it must be, will finally bring one to the desired position and insure success.

There are few, however, who at the time they should be directing their attention to their life's work, have any decided preference as to what that work shall be, and therefore most people are the more likely to float down the stream of life without a rudder.

If the choice of pursuit is made by parent or friend, it is more likely to be in accordance with the hopes or desires of the director, than with the adaptation or fitness of the subject, and the result is the latter goes through life vainly striving to fit a square bolt to a round hole. In such case there is no purpose in the matter. The subject is set to work out the plans of others, with no purpose of his own.

Every young man is better fitted by nature to engage in one class of business than in another that requires ability of a different kind. Such natural tendencies should be sought for, carefully watched and cultivated. To thwart them is certain failure. Said Dr. Chapin: "Many a man whom God has fitted to occupy an honest and honorable position as a good shoemaker, has endeavored to override God's decrees and turned out a poor clergyman of no use to himself or to any about him." The services of a competent phrenologist can in many cases be employed to advantage, for while such men may not be possessed of the definite ability they sometimes claim, they would not send one with constructiveness, small, to a machine-shop, or one in whom mathematical talent is obvious, to an engraver's room. And, in a great majority of cases, they would point out the calling or pursuit in which the person under examination would be most likely to work with a will and a purpose, and that purpose would insure success.

Perhaps it is true that there are comparatively more inefficient men engaged in agriculture than in any other pursuit. They take to the farm either from force of circumstances or want of enterprise to do anything else. They are human machines, and work with little thought. But Mother Earth is kindly, and as human mothers sometimes do, gives her children from her bounty for the mere asking. But such men are never successful. They live, to be sure, and so do the beasts of the field. The true farmer is he who starts out with an object in view, and gives the labor of both brain and muscle to achieve it—he who is not content to gather the natural product of mountain or valley, but, by care and culture, improves in quality and increases in quantity every crop that he supervises. With a purpose steadily pursued, such a one can attain almost any desirable result, even though it be apparently as difficult as to gather grapes from thorns or figs from thistles.

AN OLD THING WITH A NEW FACE.

Occasionally we congratulate ourselves that as a race we are becoming better and better—that we are leaving off our vices and becoming virtuous. We no longer love prize fights or desire to see the human face divine battered out of shape, and call it sport. It is true, that is something to be proud of; but have we not discarded the old love and taken on a new one, just as reprehensible? A few days ago, thousands of persons crowded a place of popular resort to see three men walking against time and persisting to the very verge of human endurance. Had one fallen to the ground and expired of exhaustion, no one would have been surprised. Wan and weary; sore and wounded; sick and miserable; a poor wretch tottered and limped, drawn together with pain, around the course, impelled by the hope of gain. More than $50,000 were paid by the public to see the contest. The victor in the exhibition received for a week's work more than $20,000, and yet within a few blocks of the scene there were men, women and children starving for want of food, and shivering for want of clothing and fuel. It may well be asked, "To what purpose was this waste?" Previously, a similar exhibition, with young women for the actors, had been very popular, and even as we write, half a dozen similar affairs, with women testing their powers of resisting pain and exhaustion, are in progress. It is a question if we really are any better than we should be; or if we have really made any improvement upon the manners of the past generation, when it was as common that men tested their endurance by resisting blows upon the head and body, as they are now doing by walking up to the threshold of death's door in the shortest possible time, and just stopping there, or showing how near they can approach it without passing in.

A HINT FOR THE SPRING.

Now that the season for the active labors of the farm and garden has arrived, it is well to recall the fact that an early start will win, all other things being equal. If we look around among our neighbors, we may note that he who was first in the field, and who was on the look-out for new improved varieties of seed, was the first in the market and had something new and better than usual to show, and consequently received the top price. This advantage once gained, runs through the whole season, and as step follows step, so the first being in advance, the last keeps its place, as well as the intermediate ones. So we see our neighbor at work in his drained field, while our plow may be idle on account of sodden soil and water-soaked lands. These lessons are taught year after year, and some learn them, but others do not, and perhaps some never will; but it is still our duty to keep on reiterating them, and still recalling the fact that to be prepared when the time comes, is essential to success in whatever business or walk of life we are occupied.

BREVITIES.

Plant, plant, plant—the spring is marching!

Mr. J. J. Thomas mentions the Sharpless and Cumberland Triumph as his choice of the newer Strawberries.

We shall be very happy to receive early notification of the dates fixed upon by county fair organizations for holding their annual fairs.

Have you ever tried harrowing your winter grain? If not, harrow a small piece of the field that it may be compared with the rest at harvest.

A. Darwinii is the most floriferous Abutilon we know of—it is never out of bloom. The flowers, however, are of the old brick-red color, though of goodly size.

Those planting Grape-vines, Blackberries and Raspberries, should cut down the canes to within a few inches of the ground. A bud, or so, is all the disturbed root can support.

One of the handsomest lawns we have ever seen was seeded with Red-top alone. If the ground is rich and well prepared, this seed will produce a very respectable-looking lawn the *first* season.

The veteran editor of the Germantown Telegraph evidently thinks highly of Blunt's White Prolific corn. Mr. Blunt gave him a quart of it and the editor distributes one dozen kernels among his farmer subscribers as far as the quart will go.

The severity of the past winter is specially evident among lawn trees that have broad leaves. Rhododendrons and several new hardy foreign shrubs of a somewhat similar character are much injured. Half a dozen varieties of Rhododendrons remain notably intact.

You gentleman of leisure who like the country and who do not know exactly how to pass all of your time, let us advise you: Build a nice poultry house and yard and keep a few thoroughbreds. There is more in poultry to interest you than you ever dreamed of.

Nursery stock of all kinds is extremely—shall we say discouragingly?—low. We hope that the present spring will show a reawakening to the importance of planting fruit and ornamental trees and shrubs that shall gladden the hearts of all good nurserymen who for years past have been sick with hope long deferred.

Ellwanger & Barry say that Figs may be grown as bushes in the garden in the Northern States, if they are taken up annually, the first week in November, with a ball of earth attached to the roots, and placed in a cellar till about the middle of May, when they should be taken out and replanted. Almost all of them ripen in August

Three years ago we commenced removing the terminal buds of an Austrian Pine—twisting them out sometimes in fall, sometimes in late winter. This tree is now so rosetted, so dense, that it might well be mistaken for a distinct variety. The Austrian Pine (and the Scotch, too) will stand cutting back, we believe, as well as the Norway or Hemlock Spruce.

"What are *sports* but the operations of natural laws which we do not comprehend?" asks Mr. Talbot. That is just exactly what they are, and instead of eliminating the word, as he suggests, in favor of scientific terms, to render what is already inexplicable thrice more obscure, it would be well if we used this short word, which is very expressive of our ignorance, a good deal oftener than we do.

Under Notes from the Rural Grounds, Aristolochia Sipho (The Dutchman's Pipe) is spoken of as a most desirable vine. It will be found that though most nurserymen and florists catalogue the plant, few have it in stock. We tried to procure enough of the seed to offer them in our free seed distribution. But we secured but a small quantity, which has been sent out in place of others, our supply of which became exhausted. We have never raised it from seed, but learn from those who have that it germinates freely.

Our advertising columns during this, the busy advertising season, encroach upon several of our usual Departments. These advertisements will be found the best of their class and to fill most of the needs of the country home. We respectfully ask that our readers will give them a careful looking over before making their purchases, and that in communicating with our advertisers they will mention the Rural New-Yorker, whose recognized aims and standing should secure the most favorable terms. Such mention will increase our own influence with the best class of advertisers and will indirectly be of benefit to our readers.

Our rather recent remarks respecting the Hemlock (Abies Canadensis) will be remembered by interested readers. As corroborating our estimate of that tree, we find the following in Mr. Hooper's Book of Evergreens: "We have often lingered admiringly in the contemplation of a group of these (Hemlock) trees, watching the play of light and shade as it increased or diminished through their verdure, and mentally compared these claims on our notice with the rarer introductions from abroad; and such meditations invariably resulted in the same conclusion, that, so long as they were *common* (an American term for native trees), men of more means than taste would prefer the latter class. Let them enjoy their preference; but so far as we are concerned, were we restricted to one tree, we would far rather have a fine specimen of the Hemlock Spruce, than all the Deodars and Cryptomerias ever introduced."

Mr. Meehan remarks of the Hemlock "It would not be exaggeration to pronounce this the most beautiful evergreen in cultivation."

Literary Miscellany.

LEAVE THE FORT.

BY A. VAN DYKE.

"Hold the Fort, for I am coming!"
This has been the cry too long;
We must now put on our armor,
And go forth to meet the wrong.
Let the feeble and the cowards,
Still the walls and earthworks shield,
But the strong and valiant soldier
Loves to fight in open field.

Leave the Fort, howe'er securely
All its mighty towers are made,
Plants, whose natures crave the sunlight,
Cannot prosper in the shade;
So the soul of noble impulse,
With a firm and manly port,
Boldly marches forth to battle;
Brother, sister, *Leave the Fort!*

There are evils past enduring,
There are victories to be gained;
Leave the Fort, howe'er alluring,
There's no siege to be sustained.
Let our warfare be aggressive;
Duty, danger, let us court;
Then our life will be progressive.
Brother, sister, "Leave the Fort!"

All along the line of action
Let this *better watchword* ring,
Scorning party, creed and faction,
Loyal *only* to our King—
"No man's man, but God and country's,
Honest, and of good report—
Let us walk "as in the daylight."
Brothers, sisters, "*Leave the Fort!*"

[*The Inter-Ocean.*

AN UGLY GIRL.

CHAPTER I.

"NOT there yet, Noel? How slowly we move! This is certainly the worst railway in every respect that I ever traveled on!"

Noel Estcourt, aroused from a reverie by the complaint of his stepmother—a large, fair, well-preserved woman, who would have still been considered handsome but for the fretful lines around her mouth—strove to soothe her with the assurance that another twenty minutes would find them at their journey's end.

"Twenty minutes! Is it possible? Why, we shall be nearly a quarter of an hour behind time," she commented, in the same peevish strain, "and the funeral is fixed for four o'clock, and it must be five miles from the station to Carlsforde Park. Here's railway punctuality for you! They ought to be made to keep better time!"

"And never have any accidents, nor lose luggage, nor in any other way disoblige an *exigeant* public," Noel retorted, with a smile. "After all, we shall not be more than five minutes late, so we can afford to forgive the guilty cause of the delay, whoever he may be."

"Ah! yes, you are fond of talking in that careless strain and forgetting *me*. I ought to have at least an hour to myself when we reach the Park. How can I make my appearance before strangers with my face brick-red with heat and dust, and my heart palpitating like—like I don't know what, and all through somebody's carelessness?"

"That unfortunate somebody!" muttered Noel, between his teeth. "It's well for him he's not here."

"What are you saying? Quoting poetry? If there is anything I detest it's having stupid verses quoted at me. Another stoppage! This makes the twentieth station we have called at, I'm sure of it! Anyone but you, Noel, would write to the directors, and ask them if this is what they call studying the convenience of the public?"

"And point out that when you and I condescend to make use of their line everyone else ought to make way for us. Would they set me down as a madman or a fool?" he queried, with such a quizzical look that it offended her.

"How can you talk such sheer nonsense, Noel!" his stepmother responded, with an important air. "A week ago it was very different, and I daresay your letter would not have been noticed, for you have never asserted yourself as you ought to have done. You have never been one of those energetic men who will get on in the world, no matter how."

"Your last three words convey the reason for it," he retorted, with a slight frown, for this was a subject on which they never agreed. "I have always considered it better to put up with a small salary, honestly earned, than listen to offers of help or advice which I should soil my conscience by accepting."

"My cousin Barnett means you well, and is a very clever man," Mrs. Estcourt replied, severely. "I am sure the money he has made is something wonderful, and, as he has told you again and again, in business it is no use being so over scrupulous, especially when there's such a large family as your poor dear father left me with to be provided for."

"I have always done my utmost to prevent you or my half-sisters feeling your loss too sensibly," Noel reminded her, his brow contracting a little as countless sacrifices of his own needs and wishes made for their sakes rushed into his memory, and he remembered also how seldom they had been appreciated.

Mrs. Estcourt winced, but quickly made answer: "Oh! yes, you have been very kind; but it isn't generous to remind me of these things, and you are running away from the subject we were discussing—this horrid railway! We shall be late; they will be waiting for us, for of course the funeral cortege cannot leave the house till you arrive to take your place as chief mourner; and I shall be flushed and perhaps hysterical."

"I hope not," interposed Noel, in alarm. "If you think there is any danger of that, you had better stay at the hotel in the village till the evening."

"I have made up my mind to be present," Mrs. Estcourt answered, deliberately, "and *nothing* shall prevent it. Why do you interrupt me so rudely? You know as well as I do, that the train ought—do you hear, Noel?—*ought* to be in to its time, and as for saying that a remonstrance from you would be not listened to, you cannot forget that you are now the Viscount Carlsforde, a peer of the realm, and one of the first men in the county."

Noel made her a low bow, and merrily thanked her for keeping him in mind of his new dignities; but the next moment he looked thoughtful again.

"I scarcely realize it yet. It seemed so strange to wake up one morning a banker's clerk in a shabby coat, and be told that I had inherited the title of a man whose name I never remember to have heard my father mention above once or twice in his life!"

"Your poor papa had so many queer notions," said Mrs. Estcourt, disparagingly. "He carried his humility and forbearance to such a ridiculous excess, that——"

"He was a wise man as well as a good man," interrupted her stepson, in a tone that warned her she was going too far. "I have no doubt that as he knew there were then living two comparatively healthy men nearer of kin to the Viscount than we were, he abstained from mentioning remote contingencies, lest they should raise hopes that might never be realized. But here we are at Cotby!"

"Why didn't you tell me we were so near?" demanded the lady, peevishly. "If there's anything I detest, it's being hurried in getting out of a railway-carriage: one is sure to drop one's handkerchief or one's shawl, or leave something behind altogether! How thoughtless you are, Noel!"

However, it was by Noel's care that any such disasters were prevented, and ere long they were bowling along the road to Carlsforde Park—the fair and almost princely domain of the late Viscount—in the handsome carriage and pair sent to the station to meet them.

Mrs. Estcourt leaned back on the cushions with a complacent air. For some years past she had been forced to content herself with taking her constitutionals, and paying her visits by the vulgar medium of a cab or an omnibus, and the change from genteel poverty, which in her case meant bad management and continual grumbling, shabby dresses, a slip-shod servant, and a small house, to the luxuries she expected to enjoy in the mansion of her stepson, promised to be a very delightful one.

Already in fancy she saw herself at the head of a large household, receiving and returning the calls of the county families. Already she saw the children whose romps and squabbles had been an endless source of worry and discomfort, banished to a nursery; and Irene, her eldest daughter, the awkward, unmanageable, eccentric girl of sixteen, who obeyed no authority, listened to no remonstrances but her half-brother's, placed under the surveillance of a governess, and taught to deport herself like a young lady with expectations of a handsome dowry.

A glance at the sober face of her companion, and another at her own deep mourning, reminded her that these day-dreams were scarcely suited to so solemn an occasion, and she sat silent for a few minutes. But Mrs. Estcourt was of too restless a disposition to remain so for a long period.

"You're sure, Noel, that you did not ask the lawyer who brought the news of your succession to the title, what would be the amount of the annual income?"

"Quite sure; he was in haste, and I was too much astonished to question him much."

"Still he ought to have informed you; or you should have called me into the room. I should not have been simple enough to let him go away with his tale but half told."

"Does it signify?" asked Noel, wearily. "Lord Carlsforde's will is to be read after the funeral, and it will give us all the information we require. I know that the bulk of the property was at his own disposal, and that I am the only relative he had to inherit it. Will not that suffice?"

"Who will do the honors of your house to-day?" was the next query. "Ought I not to take up my position as its mistress as soon as I enter it? I daresay the servants have had it all their own way, and robbed us shamefully ever since they have been left to their own devices! They'll not find me easily hoodwinked, I can tell them. I shall insist on having lists of every article under their charge, and seeing for myself that nothing is missing."

Noel was tempted to tell her that if the noble mansion they were approaching was to be his future home, it certainly would not be hers. As the widow of his father, she had claims upon him which he would never ignore; but he neither liked nor respected her; he was weary of her exactions, her fretful murmurings, her continual appeals to him when her children proved contumacious, and he would gladly allow her an ample income for the pleasure of being master of his own house, and freeing himself from the thraldom of her presence.

However, he contented himself with asking whether any arrangement they might enter into would not be rather premature, and Mrs. Estcourt, seeing they were close to the house, said no more, but composed her countenance into a becoming expression of grief; shook out her skirts, smoothed her crape, and hoped, in an audible whisper, that tiresome Irene would remember all her injunctions and not let the little ones fly paper kites out of the attic window, as they were in the habit of doing be it said, to the terror of the neighbors and the imminent risk of their own lives.

CHAPTER II.

Half-a-dozen elderly gentlemen, including the late Viscount's solicitor and medical man, were awaiting with some curiosity the appearance of the new lord. His family history had been already whispered by one to another; everyone knew that his father had died suddenly and in difficulties, caused by unavoidable losses, and that this young man had bravely taken upon his shoulders the burden of the fretful stepmother and her unruly little ones; but they were scarcely prepared to see him personally, at all events, so well fitted for his new position.

His cares and the drudgery they entailed had neither made him splenetic nor prematurely old. He carried himself with the manly ease of one whose mind is as vigorous as his body, and who, under all difficulties, has preserved his self-respect.

A little round-shouldered he might be from stooping over the desk, and his eyes dulled and sunken from being over-tried, yet only requiring a few weeks' repose and fresh air to carry off these signs of business life and brown the cheek, which had gained a sallow tinge in the close streets and offices of the city.

While a few necessary arrangements were being attended to, Noel entered into conversation with the other gentlemen, and learned a few particulars respecting the kinsman he had never knowingly beheld.

Lord Carlsforde, they told him, had been a shy, studious man, never keeping up any intercourse with his neighbors. On the few occasions when he could not avoid mingling with them, he had been courteous, but *distrait*. His happiness was only to be found in his library or his picture-gallery; if he left home, it was but to secure some rare tome or relic of the old masters.

The consequence was, that his house was filled with beautiful and valuable articles, whilst the weeds grew up to the door, and his face had been comparatively unknown to those who dwelt upon his estate.

Noel's informants were politely congratulating themselves and him that all these things would now be altered, when they were summoned to take their places in the funeral cortege.

With all due reverence the remains of the deceased peer were borne to the little church that stood at no great distance from the house, and laid in the family vault.

Every one who assisted at the ceremony was feasted in the usual fashion, and then Noel, the present Lord Carlsforde, accompanied the solicitor and an old friend of the late Viscount—a gray-haired Lieutenant-colonel in the dragoons, who had journeyed from the Curragh to pay the last rites to the comrade of his youth—into the drawing-room, where Mrs. Estcourt awaited them.

The housekeeper was bearing her company, and endeavoring to perform the duties of hospitality in a satisfactory manner; but the injured expression of her countenance, and the consequential manner in which Mrs. Estcourt sipped her tea, revealed to the experienced Noel that his stepmother had been giving herself airs already.

She beckoned Mr. Whitely, the solicitor, to her side as soon as he entered the room, intending to subject him to a searching cross-examination; but the lawyer was in haste, and begged that he might be permitted to read at once the testamentary papers he held in his hand.

(To be continued.)

WEAKER THAN A WOMAN.

(Continued from page 206.)

CHAPTER XLV.

ALL Loamshire was shaken to its very center. Such news had not been heard in the neighborhood for years; there was a general sentiment of rejoicing. Lady Maude Arlington was going to be married—Lady Maude, whom all the inhabitants of the country looked upon as a princess. Whom was she going to marry? That was the question every one asked. And the answer gave universal pleasure. It was the hero of the Victoria Cross—Major Rawson. Every one was delighted with the alliance. Lady Maude was so beloved; while the name of Major Rawson was known wherever bravery or valor was honored.

The county awoke suddenly. There had been many queens since Lady Maude first began to reign, but none were like her; and Loamshire awoke to the knowledge that it was about to lose its chief ornament, and that the time was come to do all honor to the Earl's daughter.

No one was more delighted than Felix. In his heart he thought no one good enough for the noble, beautiful woman whom he admired, and who had been to him the best and truest of friends. He was sorry to lose her; he knew that Bramber Towers would never again be what it had been while she reigned there; at the same time he was delighted that her noble life had its reward in a noble love.

Lady Maude could have told how she had loved the brave soldier before he went to the war in which he had gained such renown. She could have told how she had garnered her love in her heart, and had kept it as a priceless treasure, never dreaming that it could have a happy ending, yet preferring to love a hero, and love in vain, than to be the wife of a peer.

But Major Rawson loved her, and there was no obstacle to their marriage. He was heir to an ancient title, too, and a large fortune. She had a fortune of her own. So all Loamshire awoke and roused itself to do honor to the marriage of its queen.

The marriage was to take place at the old parish of Lilford. Lady Maude would have it so. The Countess of Arlington had suggested London, and St. George's, Hanover Square. Lady Maude had laughed.

"Let it be in the old church on the hill, mamma," she had said. "It is an odd fancy, but I think I should not feel that I had been married unless those solemn old oaks had shaken their heads over me, and the rooks had held a conference about my wedding.

So, as Lady Maude had had her way all her life, she had it now, and the ceremony was performed in the old church.

The rejoicings were great and many. It would have done any one's heart good to have seen the ceremony, and the crowds of children with flowers to strew before the bride—to have seen the poor, the old, the infirm, all going up to the church to have one last look at her who had been so good to them all. It was a magnificent ceremony. Peers and peeresses, with some of the first people in the land, were there. The little gray church seemed to be filled with smiling faces and costly dresses. But to Lady Maude nothing on her wedding-day was so dear or so precious as the blessings of the children and the poor.

The wedding-breakfast was given at Bramber Towers—and so goodly a number had never sat there before. Mr. and Mrs. Lonsdale, with Felix, were invited. Of all the guests who clustered round the beautiful bride to bid her farewell, she gave most heed to Felix. She went aside with him for a moment, for she read in his face that he longed to say something to her. She never forgot the few words that he did say. She laid her hand in his for a second; he bent down and kissed it, with tears in his eyes.

"How am I to thank you, Lady Maude," he said, "for all that you have done for me? You came to me in the darkest moment of my life; and I owe to you, after Heaven, all that I am. How must I thank you?"

She looked up with a smile into the handsome face that was full of emotion.

"You can thank me best," she replied, "by being, as the story-books say, good and happy now and henceforward."

"I will try," he said; "and no one, Lady Maude, says 'Heaven bless you' more fervently than I do—I whom you saved from ruin."

As they drove down the long avenue, amidst cheers, and shouts, and good wishes that were enough to deafen them, Major Rawson turned with a smile on his lips to his wife.

"I did not know that you had such a royal dowry, Maude."

"What dowry do you mean?" she asked

"The dowry of blessings from young and old, rich and poor. What have you done to make these people all love you so?"

She raised her eyes to his.

"I have done nothing but my duty," she replied.

"Then you have done it with grace and sweetness," he said. "Teach me to do mine as well. If I could hear as many blessings follow me as follow you, I should be happy."

"Are you not happy now?" she asked with a charming smile.

His answer was prompt and decisive.

Knowing Miss Lester's secret predilection for hearing news, that she was too proud to seek, Felix went over to the Outlands a few days afterwards. He had not seen Eve lately, and was anxious about her. He had heard Kate say that she was not looking well—that she had grown thin and pale, and seem to have lost some of her old bright spirit; and those few words had made Felix anxious. Finding one evening that he had an hour's leisure, he thought that he could not do better than devote it to her.

Miss Lester was looking a little more cross and impatient than usual when the young lawyer greeted her, and he asked what was the matter.

"I am not pleased about the corn," she replied briefly.

"I am sorry to hear it. What is the matter with it?"

"It does not ripen as it should," she replied.

"That must be the fault of the sun," said Felix.

"No matter what is to blame, the misfortune is just the same," returned Miss Lester. "What has brought you here to-night, Mr. Felix? I saw your name in the Loamshire Gazette. You were present at all the gay doings at Bramber Towers."

"Yes," he replied, "I was there."

"Then tell me all about Lady Maude's marriage. It is not often that one has the opportunity of hearing about such grand affairs; tell me everything that you remember."

"I came on purpose to do so," said Felix. "I thought you would be pleased to hear about it. But shall we not wait for Eve? Perhaps she would be interested too."

"No," replied Miss Lester, "she would not—unless it were about a marriage in the moon. I tell her always that she is waiting to marry the man in the moon. Sit down here by these bee-hives. Never mind the bees; they will not sting you unless you interfere with them. As I sit here I can see what is going on around me; and no man is idle while my eyes are on him. Tell me about Lady Maude first. Do you know, I heard a foolish rumor once, Felix Lonsdale?"

"I am afraid you have heard a great many false rumors in your time, Miss Lester," he remarked. "It seems to me that the world is full of them; What was the one you refer to?"

"I heard that you were in love with Lady Maude, and that she liked you," said Miss Jane solemnly.

He laughed so heartily that she felt at once there was no truth in it. Her grim face relaxed at the sound of his mirth.

"How absurd!" he said. "There is no lady in England whom I hold in higher reverence and esteem than Lady Maude. As for being in love with her, it is sufficient to say that she is an earl's daughter; and in my own fashion I am as proud as a king. I would no more marry a rich woman, and live on her money, than I would cheat or steal."

He marvelled why Miss Jane looked so intently at him.

"I wonder if you will always think so?" she said earnestly,

"I am quite sure that I shall. I think independence a noble quality, and one to which Englishmen especially may lay claim. I have a great respect for it, and shall ever exercise it."

"Now tell me about the wedding," said Miss Lester. And Felix gave her a most animated account of it.

She was delighted, and would have listened to him for another hour, but that her keen eyes de-

tected a dairymaid enjoying the homage paid by one of the reapers.

"Go into the house and find Eve," she said. "I shall be with you directly."

Felix found Eve in the garden; and so intently was the girl thinking that she never heard his footsteps until he stood by her side.

"Eve!" he said gently; and he was startled by the sudden change in her face when she saw him. It was dyed crimson, and the sweet earnest eyes fell before his. She could not speak to him at once; and a sudden conviction flashed across his mind that at the moment he had accosted her she was thinking of him.

"My dear Eve," he said, "are we such strangers that you should be so startled at my presence? The *tante* told me you were not looking so well, and I am come to see."

"I am quite well," she answered in her sweet low voice, "and very pleased to see you."

"You look well enough just now. You have the color of a rose in your face," he told her. "May I find a seat here? I have an hour to spare, and am come to spend it with you."

He sat down on a little garden chair, under the luxuriant jessamine, and began to talk to her. A sense of peace and repose always came over him when he was with Eve—a sense so sweet that he never cared to disturb it; and the same magical feeling was stealing over him now. When they had been talking for some time, he looked at her; and then he saw how true Mrs. Lonsdale's words were. The sweet face had grown very thin and pale; there was a dull look in the tender eyes, as though she had wept bitter tears. She was much changed, and Felix was pained to see it. He marvelled as to the cause, and then decided to question her.

"Eve," he said gently, "you are not well. Why do you not go to the seaside for a change of air?"

"I am happier here than I should be anywhere," she replied.

His ears detected a tone of patient weariness in her voice.

"Eve," he said impulsively, "I do not believe you are happy. Have you any trouble or sorrow? Trust me, as I trust you."

The sweet face looked up at him.

"I have no trouble," she answered—"and Heaven has been very good to me."

But long after Felix had gone away she sat under the luxuriant jessamine, and once she cried—

"Oh, my love, you will never know in this world how I love you!"

CHAPTER XLVI.

One fine morning in September a letter came to the office of Lonsdale & Son which presented very familiar features to those who received it. The creamy color of the envelope, the delicate handwriting, the faint perfume of violets, the crest on the seal—each and all were familiar.

"It is from Lady Chevenix," said Felix, as he placed it before his father—of all the letters that had been received from her he had never opened one.

Mr. Lonsdale read it, and then looked at his son.

"She is coming home," he announced. "She will be at Garswood by the end of the week, and wants me to see that everything is ready for her. I had better go over to the Hall at once. Ah, here is a postscript—there is sure to be one in a lady's letter!—'Remember me kindly to Mrs. Lonsdale—and Felix.'"

"She is very kind," said Felix, as he sorted his papers. "I suppose you told her what an accumulation of business awaits her?"

"Yes. I thought it time she either returned or gave me fuller powers of acting," replied Mr. Lonsdale. "I am glad she is coming home. I do not like the Hall to be closed; it makes the whole neighborhood dull."

Darcy Lonsdale rode off at once with his good news; and very pleased the household at Garswood were. Their young mistress had been worshipped amongst them, and they were delighted at the thought of her return. Mr. Lonsdale gave all necessary orders, so that Lady Chevenix should not miss any comfort or luxury.

He called on Mrs. Haye, and found that she also had heard from her daughter, and that she was going to Garswood to be in readiness to receive her. Mrs. Haye had very ambitious views for her daughter; she had plenty of good advice to give her. Now that she had secured wealth and a title, she must look for something higher still.

"She ought to marry a duke next," she said to her husband; but Francis Haye answered—

"It is just possible she may not care to marry again."

His wife laughed at this.

"After proving herself so sensible, do you think she intends to retire upon her laurels? You may depend upon it, Francis, her second marriage will be far more brilliant than her first."

"You know best, of course, my dear," said Francis Haye meekly. "Violet owes a great deal to your training."

"I flatter myself," remarked Mrs Haye," "that I have made her what she is. My prudence and diplomacy, during her first foolish engagement to Felix Lonsdale, made her Lady Chevenix."

"That I believe; but I doubt if she has ever been really happy since. Do you remember how she used to smile and blush when Felix came?"

"It was childish nonsense; she has something better to do than smile and blush now," replied Mrs. Haye severely. "I hope when she does come you will not encourage her in any nonsense. Only imagine if we should live to see her a duchess! I always knew that she would be fortunate in life. What a cruel thing it would have been if she had married Felix Lonsdale!"

At the end of the week another letter came to the office at Lilford, asking Darcy Lonsdale to go over to Lady Chevenix at once. He went and on his return he said to Felix—

"There is a terrible accumulation of work at Garswood. Lady Chevenix wishes me to remain at the Hall for a week, and clear up all arrears. It will occupy a week—the Michaelmas accounts are always heavy—but, Felix, I cannot spare a week. Lord Arlington's rent-dinner and many other things are close at hand. I do not think I can spare a week. I made a suggestion to Lady Chevenix, which she seemed very pleased with; it was that, instead of my going to the Hall for six days, we should both go for three—that is, of course, if you are willing."

"It is a matter of indifference to me, father," he replied. "Whichever plan suits you best, or pleases you best, I will follow."

"Then we will both go. It is far easier to go to Garswood and take a clerk with us than have all that mass of documents brought to the office."

So it was settled that they were to go to the Hall, and do all the business as quickly as possible there.

"I shall prefer sitting up at night," said Felix. "I can always work better when there is perfect silence. A few hours' extra work each night, and we shall soon have finished."

He little dreamed to what that sitting up would lead.

They went on the Monday evening—a beautiful autumn evening, when the sunbeams fell on the gray walls and lighted up the picturesque mass of buildings. Several visitors were at the Hall. Captain Bell, Mrs. Haye, Miss Hethcote—who seemed as though she would never leave Lady Chevenix again—Lady Browning, and Miss Fern—all guests whom Lady Chevenix had invited.

Father and son were taken at once to her boudoir, where she sat alone; and never in her whole life had Violet looked so charming. The year of quietness and repose in the climate of Normandy had been marvellously beneficial to her. While there she had not a shadow of care; she had studied nothing except to forget the past, to realise her good fortune, and to recruit her health. The consequence was that she returned with a lovely and dainty bloom. There was no longer the faintest shadow on her face; it was full of radiant, laughing light; the violet eyes were clear and bright as stars, the scarlet lips untroubled.

Felix looked at her as she stood in the light of the setting sun, and his eyes were dazzled by her beauty and loveliness. She wore a dress of rich black velvet cut square, so as to show the white neck, on which a diamond cross gleamed like fire. She wore diamond bracelets on her arms; diamond stars shone in the coils of golden hair.

In kindliest greeting she held out her white jewelled hands to Mr. Lonsdale and his son; but her marvellous beauty had for a few minutes stricken them dumb.

"I am so delighted!" she said; and truth shone in her beautiful eyes. "I thought I would see you here first, away from the other guests, because I wanted to talk to you. Mr. Lonsdale, take this easy-chair. Felix"—she had quite fallen into the old fashion of calling him Felix—"sit here. I did not see you"—to Felix—"to bid you good-bye; but I am well pleased to see you on my return. There is no place like home, is there, after all? Normandy is very beautiful, but Garswood is home. Now tell me all that has been done in Lilford since I left. You were at Lady Maude's wedding—tell me about it, Felix. I am so glad she married her hero after all."

They spent one of the pleasantest hours that could be imagined. The same idea struck both father and son. Lady Chevenix seemed to have grown young again; her sunny smiles, her unusual laughter, her quick, clever repartee, her keen enjoyment of their society—all were noticeable. She had indeed altered; she was like Violet Haye; all trace of the quiet, cold Lady Chevenix had vanished.

Then her smiles died away for a few minutes as they talked of the terrible trial they had gone through together. She looked with soft luminous eyes into Darcy Lonsdale's face.

"What old friends we are!" she said thoughtfully. "And how strange it seems that you should have been with me when he died—that Felix should have been my chief comfort! What a riddle life is to read!"

After a few minutes Mr. Lonsdale remarked—

"You must not charm us into forgetting our work, Lady Chevenix; there is so very much to be done."

"You can begin as early as you like in the morning," she said, "but this one evening you must give to me. Think what a pleasure it is to me to talk to such old friends. I shall get up early too, and see that you have breakfast before you begin. I shall make your tea; I am sure no one else could make it nicely enough."

Darcy Lonsdale told her laughingly that she would spoil him; and both gentlemen were surprised to find that they had been talking for an hour instead of a few minutes.

They rose when the first bell rang for dinner, and Lady Chevenix, looking at Felix, asked him—

"How is Evelyn Lester?"

He told her that she was not looking either bright or well lately; and then they separated.

Long after father and son had left her, the beautiful woman sat with happy brooding light in her eyes, and a smile like summer sunshine on her lips. And when she rose to return to her visitors she murmured to herself—

"At last, my love, at last!"

(To be continued.)

SMALL POINTS OF TABLE ETIQUETTE.

THERE are a few points of table etiquette not directly connected with the giving and receiving of dinners and teas, but which are of the first importance, as they concern individual behavior. We would be inclined to think every one acquainted with them, and allusion to them a matter of supererogation on our part, if it were not that we see them so frequently violated. Those of our readers who are, or have always been familiar with them, will perhaps pardon our speaking of them for the sake of those who are not.

We do not expect to see these *gaucheries* in the best society; but there are many people perfectly well-fitted for the best society but for ignorance concerning these things, which although trifles in themselves, are of such infinite importance on the whole. For instance, where all the requirements are not fully known, if a general cessation of conversation should suddenly supervene upon the serving of the soup, would there be silence in the place? Not at all; the gap would be filled with a continuous bubbling sound from the mouth of some one or other unlucky wight, whose mother never taught him to take soup properly, and who is possibly disturbing and disgusting all those that do better and who know how easily the trouble might be avoided. Soup is to be taken from the side of the spoon, not from the tip, and it is not to be sucked in, but the spoon being slightly tilted it is rather poured into the mouth than otherwise, the slightest silent inhalation being sufficient for the rest.

Another generally neglected obligation is that of spreading butter on one's bread as it lies on one's plate, or but slightly lifted at one end from the plate; it is very frequently buttered in the air, bitten in gouges, and still held in the face and eyes of the table with the marks of the teeth on it. This is certainly not altogether pleasant, and it is better to cut it a bit at a time, after buttering it, and put piece by piece in the mouth with one's finger and thumb.

Let us mention a few things concerning the eating of which there is sometimes doubt. A cream cake and anything of similar nature should be eaten with knife and fork, never bitten. Asparagus—which should always be served on bread or toast, so as to absorb superfluous moisture—may be taken from the finger and thumb; if it is fit to be set before you the whole of it may be eaten. Peas and beans, as we all know, require the fork only. Potatoes, if mashed, should be mashed with the fork. Green corn should be eaten from the cob, but it must be held with a single hand.

Celery, cresses, radishes, and all that sort of thing are, of course, to be eaten from the fingers; the salt should be laid upon one's plate, not upon the cloth. Fish is to be eaten with the fork, without the assistance of the knife; a bit of bread in the left hand sometimes helps one to master a refractory morsel.

Berries, of course, are to be eaten with a spoon. In England they are served with their hulls on, and three or four are considered an ample quantity. But then in England they are many times the size of ours. There they take the big berry by the stem, dip it into powdered sugar, and eat it as we do the turnip or radish. It is not proper to drink with a spoon in the cup; nor should one, by the way, ever quite drain the cup or glass. Spoons are sometimes used with puddings, but forks are the better style. A spoon should never be turned over in the mouth. Ladies have frequently an affected way of holding the knife half way down its length, as if it were too big for their little hands; but this is as awkward a way as it is weak; the knife should be grasped freely by the handle only, the forefinger being the only one to touch the blade, and that only along the back of the blade at its root, and no further down. In sending one's plate to be helped a second time, one should retain one's knife and fork, for the convenience of waiter and carver. At the conclusion of a course, where they have been used, knife and fork should be laid side by side on the plate—never crossed; the old custom of crossing them was in obedience to an ancient religious formula. The servant should offer everything at the left of the guest, that the guest may be at liberty to use the right hand. If one has been given a napkin-ring, it is necessary to fold one's napkin and use the ring; otherwise the napkin should be left unfolded. One's teeth are not to be picked at table; but if it is impossible to hinder it, it should be done behind the napkin. One may pick a bone at the table, but, as with corn, only one hand is allowed to touch it; yet one can usually get enough from it with knife and fork, which is certainly the more elegant way of doing; to take her teeth to it gives a lady the look of caring a little too much for the pleasures of the table; one is, however, on no account to suck one's fingers after it.

Wherever there is any doubt as to the best way to do a thing, it is wise to follow that which is the most rational, and that will almost invariably be found to be the proper etiquette. There is a reason for every thing in polite usage; thus the reason why one does not blow a thing to cool it, is not only that it is an inelegant and vulgar action intrinsically, but because is may be offensive to others—can not help being so indeed; and it, moreover, implies haste, which, whether resulting from greediness or from a desire to get away, is equally rude and objectionable. Every thing else may be as easily traced to its origin in the fit and becoming.

If, to conclude, one seats one's-self properly at table, and takes reason into account, one will do tolerably well. One must not pull one's chair too closely to the table, for the natural result of that is the inability to use one's knife and fork without inconveniencing one's neighbors; the elbows are to be held well in and close to one's side, which cannot be done if the chair is too near the board. One must not lie or lean along the table, nor rest one's arms upon it. Nor is one to touch any of the dishes; if a member of the family, one can exercise all the duties of hospitality through servants, and wherever there are servants neither family nor guests are to pass or help from any dish. Among the English nobility an old custom has been lately revived in which at a certain point of the dinner the servants are dismissed and the ladies of the family take their place. This is very pretty for a scenic occasion; but it does not suit the luxury and ease of modern times, and is a reminiscence, however hospitable, of the old degradation of women that will meet with no wide favor. Meanwhile in America, destitute of knights or castles, there is no excuse for it whatever.—*Harper's Bazar.*

Prince Battenberg of Germany has abandoned his scruples relative to the acceptance of the throne of Bulgaria and his election is regarded as certain.

MAGAZINES.

LIPPINCOTT'S MAGAZINE for April has the following attractive table of contents: A visit to the Shrines of Old Virginia. Illustrated. David H. Strother ("Porte Crayon"); English Vignettes. Illustrated. H James, Jr; Women's Husbands.—II. The False Prince. Part I; Folk-Songs. W. W. Young; Moliere. The Life and the Legend. Illustrated. J Brander Matthews; Trees in the City. Edgar Fawcett; The Hoosiers at Home. Mary Dean; Through Winding Ways. Chaps. XXVIII. XXXI. Ellen W. Olney; Ancient Decorative Stuffs. H. M. Benson; Our Beaux, Sarah Winter Kellogg; My Village in the South. Part II. Annie Porter; A Bit of Old Satsuma. William Elliot Griffis; A Lady's Life in Brazil. M. C. W; Our Monthly Gossip; Literature of the Day.

THE TOOTH MARKET.

Americans of old families are peculiarly light, wiry and well knit. Chinese art and Egyptian monumental sculptures show that the long-continued civilizations were perpetuated by just such slight bodily frames. Redundancy is no evidence of endurance. Our sinewy outlines are a proof not of feebleness, but of refinement and vigor. There is no physical deterioration among Americans. Nevertheless, our teeth, according to statistics, are eight times the worst in the world. This is the result of pure and unadulterated ignorance. Books, newspapers and magazines have plenty of dissertations on the care of the physique—on exercise, respiration, care of the feet, best way to walk, proper quality of clothing, treatment of the eyes, physiological arrangement of houses, and so on—but nothing is said about the teeth. Ignorance is never bliss. From lack of knowledge on this subject everywhere are seen persons whose shrivelled or distorted and expressionless mouths betray the absence of natural teeth. Columbia might be represented as a lady with false teeth. This state of things implies awful suffering. It implies premature old age, fractured and necrosed jaws, tumors, abscesses, neuralgia, tic douloureux.

There are in the Union about sixteen thousand dentists, of whom only about two thousand are of the slightest benefit to their patients. Ignorance permits fourteen thousand men to live among us by uselessly torturing their fellow-beings. They are worse than Macbeth; they murder more than innocent sleep—good temper, beauty, youth and health. They should write over their doors, "Cease to laugh, all ye who enter here!" for those who walk in funereal gloom with pale and anxious faces through their portals will come forth toothless or soon to be so."

The dentists who advertise false teeth at ten dollars a set practise horrible barbarisms. All the appliances of dental science do not save as many priceless organs in ten years as these miscreants sacrifice in six months with their bad tooth-fillings, tooth-pullings and fillings. Notwithstanding all that has been done to stay the waste of teeth, there are as many destroyed this year as there were last, and *more* dentists. I know a woman who had twenty teeth extracted by a country dentist because they were somewhat loose, and false ones substituted. The timid and uninformed are swindled out of their teeth by mercenary wretches who persuade their patients to submit to permanent injury and lasting mutilation, when the hand of conservative skill would do them abiding good.

The ignorant are persuaded that their teeth are worth about fifty cents apiece, and that it is an act of bravery to have one pulled out. To have a tooth pulled out is as monstrous as to have an eye pulled out. A good dentist will never extirpate a tooth. Were all dentists able and conscientious, there would be a panic in the tooth market. False teeth do not supply the loss of real ones—do not restore the original contour of the face nor the ability to speak correctly and agreeably: a false tooth can be detected as far as it can be seen.

Uncleanliness is the main cause of tooth decay. Food acidities if left in the mouth, and there are acids and alkalies in our food and in allopathic medicines that go on the principle, You eat me and I eat you. Where the enamel is cracked by extremes of heat and cold in the food, or where the teeth have never been perfectly matured, and there are minute crevices in the enamel, then acids will penetrate to the limy interior of the teeth and destroy them, unless prevented by perfect cleanliness. If tartar accumulates on the teeth for lack of brushing, it causes recession of the gums and loosening of the teeth. It must be removed by some sharp instrument. Dentifrices that will remove tartar will remove teeth. All liquid dentifrices devour the teeth. The white-ashes of a wood-fire gently rubbed on the teeth with a small stick will remove yellow streaks. Friction of the brush, cold water and a little soap are all that are necessary to greatly improve the worst of teeth and gums.

We do not belong to the rodent species; our teeth, once broken or lost, do not grow again. Still, let all who have defective teeth hope, for their teeth may be in a measure restored. Nutrition goes on in every living structure. The crystals of the enamel are living structures. The teeth are subject to the law of waste and supply, as are other organs. Poor teeth will improve with a good diet. Toothache is often followed by health of tooth and nerve. Juicy beef and mutton, eggs, oysters, milk, and the like, have good tooth-material; starch, fat and sugar have it not. The mineral element that sustains the hard portions of the teeth exists largely in the hull of grain. If our food contains plenty of this earthy matter, our teeth will not be soft and chalky, but dense and capable of resisting decay, and built up atom by atom like hard stone; and will so remain until supplies are diminished. Americans feed to animals or throw away the part of their wheat which contains the tooth-element. The teeth of a foreign peasant that have been built on black bread will break down on a diet of pork, pickles, preserves, pastry and superfine flour.—*Lippincott's for April.*

AMERICAN NATURALIST for April, contains Animal Music, its Nature and Origin, Xenos Clark; The Artificial Mounds of the Island of Marajo, Brazil, Orville A. Derby; Native Bitumens and the Pitch Lake of Trinidad, W. O. Crosby; Notes on an Extensive Deposit of Obsidian in the Yellowstone National Park, Wm. H. Holmes; Recent Literature, Macfarlane's Geologists' Traveling Handbook—Recent Books and Pamphlets; General Notes; Botany.—The Number of Stamens in Brasenia peltata.—A Fairy Ring.—Insects as Unconscious Selectors of Flowers.—Botanical News; Zoology.—The Oviposition of the Queen Bee and Dzierzon's Theory—Merrill's Ornithology of Southern Texas—An Insect Borer in Powder Barrels—A Large Saw-Fish—Wrens and the Bee Moth—An Owl's Revenge; Anthropology.—The International Congress of Anthropological Sciences held in Connection with the Universal Exposition at Paris, August 16-21, 1878—List of some Anthropological Catalogues of the Paris Exposition, 1878—Anthropological News; Geology and Palæontology.—The Genus Coelodon—Dawson on Eozoon—A New Genus of Perissodactyla.—A New Genus of Ichthyopterygia—Muschelkalk Fossils in Idaho; Geography and Travels.—The Dutch Arctic Expedition—The Norwegian North Atlantic Expedition—Geographical News; Scientific News; Proceedings of Scientific Societies; Selected Articles in Scientific Serials.

For Women.

CONDUCTED BY MISS FAITH RIPLEY.

THE WOMAN'S CLUB.

A "CLUB REVIEW."

I HAVE been very much interested in reading the different letters published in the Woman's Club, and although I acknowledge my inability to write anything worth printing, I would like to notice a few ideas that have been presented—I would like to say to Free Lance that "there is at least a small minority who will be interested in hearing a little about the Boston Society to Encourage Studies at Home." All honor to "the ladies who first conceived the thought of this Association." I think the thought carried into effect is splendid, and that this society will be the means of educating and refining a number of ladies throughout the land. I am sorry that there are any women who do not care to avail themselves of such good opportunities for mental improvement. Though I believe that the "life is more than meat, and the body than raiment," I cannot close my eyes to the fact that we have both to care for, and however commendable and beautiful it is to be found at the feet of Jesus, having "chosen the better part," Martha's position must also be filled. Our physical natures demand both food and raiment.

I would say, too, that the fashion articles and designs for fancy work are very acceptable, especially to invalids, who are compelled to remain at home so much. They like to know something of what is going on in the outside world as to the fashions, and they find that the designs for fancy work help to make bright many an otherwise cheerless hour; for there are many in out-of-the-way places where the RURAL goes who cannot afford magazines and similar helps. The combination of so many interests in one paper and at a price attainable, is one of the RURAL'S strongest recommendations. It is *one* of the best papers for a family to take, when they can afford a variety of periodicals, and when they can have but *one* it is *the very best*. I would not have it different from what it is now, except I would prefer to have it printed on paper strong enough, so that we could read it all we want to and still have it preserve its crisp and neat appearance. So do not complain F. L. until we women get more time than half the paper. I, for one, will be willing to relinquish a few columns of our side of the paper, to pictures of the latest style of dress-coats, smoking-caps, &c., when we women have so far degenerated as to make it necessary for you men to remain in-doors and fashion and *make* your own garments.

Jacquelina commands my admiration for her courage in expressing what many others would like to, I would add that it is a truth too glaring to pass without notice, that the Gospel is in many ways too dear. How many, think you, of the poor are hindered from attending where the "glad tidings" are told, "because the church is too fine and the people too well dressed?" I have been answered thus in reply to "Why do you not come to church and Sunday-school?" I know many who persistently keep away from the house of worship, because they feel so common that they shrink from going where they will feel so keenly the contrast between themselves and their surroundings. Again, I have heard persons say, "Oh, I cannot attend church regularly, for I do not always have the ready funds for the contribution-box, and I will not go and be made to feel so cheap." I pity *all* possessed of such a weakness, and would that all of us could have the strength and courage to dress as neatly as circumstances will allow, take gifts in our hands for the altar if we can, and if not, go without; but in either case endeavor to take the sacrifice of a "broken spirit, a broken and a contrite heart," remembering that we are frail creatures, and need to assemble where prayer and praise is wont to be made, and partake of the bread of life broken in the sanctuary. Another way in which the Gospel is dear, is in the literature of the church. While I admit that the publishers of religious periodicals are doing a noble work: a work that will tell in eternity, yet I would like to be informed why it is that so many, if not nearly all, of the aforesaid periodicals remain at the same price or a little above what they were when a dozen of eggs or a pound of butter cost twice as much as it does now? One will say, what have eggs and butter to do with religious reading matter? This much, that it takes much less to support the publishers than it did years ago, and where subscribers have the produce of the farm to sell, and must put up with reduced prices, it is plain that something in the list of needfuls must be left out. In many instances it is the religious paper with the remark that "it's too dear, anyway; we'll have to do without it." I have in mind now a nice, little Sunday-school, that found itself compelled to do without the childrens' papers for several months, because they could not raise the means to get them. God speed the day when all lovers of Christ's kingdom shall be willing to make sacrifices, in order to proclaim the good news "to every creature." SARAH.

TEMPERANCE IN POLITICS.

WASHTENAW, in her letter to the Feb. Club, seems inclined to ridicule the members because they "*don't discuss*," and she throws out several personal challenges, as well as a general one on the subject of temperance in politics. She says, "I don't see why temperance should have anything to do with politics. This is a *moral reform*, and we want to *persuade* men to be temperate." Yes, but when persuasion is of no avail, what then? If men could be *persuaded* to abstain from *all* wrong and crime, it would be unnecessary to have any laws for their punishment, but unfortunately, depraved appetites and deadened consciences are not always to be persuaded, and the strong arm of the law becomes necessary to remove the temptation to wrong-doing. But leaving the habitual drinker entirely out of the account, would not the danger to young men and boys, under the prohibitory system, be very much less than if a rum hole were allowed to flourish on every corner? We know that vice begets vice, and statistics show that where there is no legal restraint put upon the sale of spirituous liquors, there drunkenness and crime abound to a much greater extent than in places where there is a prohibitory law in force.

Chief Justice Noah Davis of the Supreme Court, in a recent speech on temperance, cites so many incontrovertible facts in support of this that I will quote from him, feeling that his arguments are stronger, and more unanswerable than anything which I can offer. He commences with this assertion: "Among all the causes of crime, intemperance stands out the unapproachable chief," and establishes the truth of what he claims by a mountain of evidence. But as temperance in politics is what I wish to deal with more particularly, I will only quote a little of what he says about the "Benefits of Prohibition."

"The relation of intemperance to crime is also plainly manifest where drunkenness is repressed by partial, or complete prohibition. The cases of towns and villages where, by the arrangement of their founders, no liquors or intoxicating drinks have ever been allowed to be sold, furnish strong evidence. Vineland, with its 10,000 people, without a grog shop, and with a police force of one constable who is also overseer of the poor (with a salary for both offices of $75), reports in some years a single crime, and a poor rate swelling to the aggregate of four dollars a year. Greeley in Colorado, is another town of 3,000 people, and no liquor shop. It neither uses nor needs a police force, and in two years and a half, seven dollars only was called out of its poor fund. Bavaria, Illinois, a town of the same population, with absolute prohibition, was without a drunkard, without a pauper, and without a crime. In Maine, under the prohibitory law, the convictions for crime in 1870 were one for every 1,589 population, while in our own State during the same time, the average was one in 620. In Connecticut under the prohibition law of 1851, crime is shown to have diminished 75 per cent. On the restoration of license in 1873, crime increased 50 per cent. In a single year, and in two years in Hartford, crime increased 400 per cent. In New London the prison was empty, and the jailor was out of business for a while after prohibition went into effect. In New York, the Metropolitan Excise law of 1866, was absolutely prohibitory on Sunday. Prior to that law, there had been no material difference in the number of arrests on that, and on other days of the week. After the law went into effect, the number of arrests on the Sabbath was diminished more than one-half. On the day of our annual elections, a statute draws around each polling place a circle of absolute prohibition, within which no intoxicating drinks may be sold or given. Contrasted with former days, who fails to recognize the change from excitement, disorder, and crime, to almost universal quietude and peace? And who does not see that the measure of peace depends upon the vigilance with which the police enforce the statute?"

The address contains many more statistics that are just as convincing, but these ought to suffice to prove to any reasonable person that a prohibitory law can be effective in the suppression of the sin of intemperance and its attendant evils, as well as for the prevention of other crimes.

MRS. W. C. G.

TOO PEACEABLE BY HALF; BEAUTIFUL WOMEN; UGLY MEN.

SO ERMENGARDE has offered to "make up" with her old antagonist! There is nothing left for us but to settle down to a "preaching" club. No quarrels, no excitement, nothing but humdrum moralizing. It's all wrong. I have too, an uneasy consciousness that I was instrumental in bringing Ermengarde to a public acknowledgement of her change of sentiment toward Free Lance. Why must we be a "happy family"?

As being terribly in earnest about something or other seems to be the ruling idea of these feminine gatherings, I suppose I may as well fall in line, don my moralizing cap and begin. I shall take a speech of the lately deceased Sir Owen Chevenix—the brutal husband in Weaker Than a Woman—for my text. When he announces his desire to enslave an unfortunate woman for life (only he don't put it exactly in that way) he says, "I would rather marry a woman of great beauty with a thousand faults than a plain woman with the virtues of an angel."

The gentleman but voiced the sentiment of his sex. Men insist that women shall be beautiful. No speech is too coarse or too bitter to characterize their utter contempt for plainness in a girl. Even the refined and kindly Dr Ludgate in George Elliott's Middlemarch, regarded ill-favored women "as something to be faced with philosophy and investigated by science." (It did my vindictive soul good to have his beautiful Rosalind make his life a burden to him.) It is natural to admire loveliness and to prize it, but why make the lot of ugly women all but unbearable by insisting that not having fulfilled the first requisite, no amount of moral excellence or intellectual brilliancy can make amends for their lack of physical charms?

To the sins or ignorance (sometimes both) of their ancestors, children are indebted for bodily imperfections, and yet one would suppose, to read what men say, that ugly girls were responsible for their own plainness.

Is it any wonder that every possible device is resorted to by these unfortunates to improve their appearance? Yet even these endeavors are made the subject of no end of satire, and men take immense delight in detecting the false coil or the rouged face.

So long as women must be beautiful above all things, they are justified in using every contrivance—whether artificial hair or teeth, powder or rouge—which will add to their attractiveness. (Now I suppose in imagination you'll picture me as most awfully "made up." Even, however, at the risk of your holding such an opinion, I still maintain that if we *must* be pretty, let's use all means at our command to accomplish the desired result.)

Men arrogate to themselves the monopoly of physical hideousness. A man may be utterly devoid of beauty and yet it is not counted as a reproach to him. He may be as plain as it is possible for a man to be, and he is not made to feel that his life is a failure on that account. And then the presumption of them! They mate womanly beauty with masculine ugliness and call it an equitable match. Have women no taste for masculine beauty? Do coarse red skins, bristly beards and misshapen forms enchant us? Is a plain-looking man a more engaging-looking object than a homely woman? WASHTENAW.

A SUGGESTION OR TWO.

WOULD it not be well if parents regarded more scrupulously than many of them do, the little personal rights of their children? In one of the best families I ever knew, each boy and girl had a little fund of his or her own, acquired in various ways by the help of their parents, and if the boys wanted a knife, letter paper, stamps, or any such thing, they bought it out of their own resources, with a proud sense of responsibility; if the girls wished a ribbon, or a magazine, it gave them a pleasant sense of personality to purchase for themselves. And if their mother, in any of her business transactions, needed some extra money they were pleased to be able to lend it to her, and she always repaid it as carefully as if she had borrowed it from an outside individual. It was practice as well as precept with them to be not only affectionate, but just to each other. These children are now nearly all grown, and are doing business on their own account, and the young men are proverbial for their exact business habits, their high sense of honor, and general excellence of character; the young women are held in equal estimation by all who know them. The happy mother when questioned as to how this result was brought about says that if it is her doing, she thinks it was owing to their being trained in *little things* to regard others' rights as well as their own.

A never-failing source of amusement to the little folks of all ages, is the making of scrap-books. The materials are almost always at hand. Volumes of patent-office reports, or even small pamphlets which have become useless lumber in so many houses can be made use of in this way. Cut out as many leaves as seem necessary, perhaps every other one, and you have a foundation. Provide the little ones with a pair of blunt-pointed scissors and let them cut out and trim neatly, the pictures from papers you do not care to preserve, circulars of farm machinery or anything they fancy, and then, armed with a cup of boiled starch and an old tooth brush (if you have one), let them exercise their ingenuity in filling the book with their collections. Quite small children find enchantment in this kind of work. A large picture may be put in the center of the page, and the space around it filled with small ones, or short pieces of prose or poetry. I have seen very pretty ornaments for these juvenile scrap-books cut out of the illustrated books for children, which had become badly tattered with use so that the pictures were all that was worth preserving. When two pages are full the book should be left open until dry before going on. This amusement need not make much litter about a house, and the little workers can easily learn to pick up their scattering scraps after themselves, and wash up the starch-cup and brush after using it, so that it will be ready for the next rainy day. B. C. D.

SILK DRESSES, DISH-WASHING AND HOW TO COUNTERACT BANEFUL INFLUENCES.

I AGREE with Miss Harvey on the "silk dress" question, though I should hardly think anyone would need a silk who had not "a second best." Everybody should own one nice dress suitable for extra occasions. I do not think Miss Harvey intended to convey the idea that the "black silk" should be worn for "traveling" and to choir-meeting and on all ordinary occasions; but that it should be ready so that one might be saved the vexation and annoyance that often arise from having nothing suitable to wear. I am willing "Jicks" should don her short skirts and "pantaloons," but I think them—abominable.

Should there be "anything satisfactory in removing the dreadful necessity of dish-washing," I fear something as terrible would stare us in the face. I like washing dishes much better than cooking, but dislike housework generally. Yet it is through our dislikes that we are disciplined, and I think that the cares and trials of us housekeepers are sent to make us nobler and better women. It is those who have suffered most and learned the great lesson of endurance who speak the sweetest words of sympathy. Many a wife and mother learns daily to "suffer and be strong" through "seas of trouble" that would drown dish-washing. If we reject the small trials, heavier ones will be sure to come. Let us then accept the inevitable, and

> "Cheerfully take what God bestows;
> And, like His own fair flowers,
> Look up in sunshine with a smile;
> And gently bend, in showers."

I truly sympathize with Mattix in regard to her husband's influence. Let there be no contentions before your boy. They will do much harm. If your husband speaks what you know will hurt your boy if he follow it, be still in his presence, but take the first opportunity you have alone with your child to counteract that influence; but not to the detriment of his father. Choose your words wisely, if you study a long time to do so. Be sure you have and keep your child's confidence. Above all, teach him the great principle of right; let it be thoroughly inculcated in his mind. Plead with God that your efforts may be blessed and your child saved from all evil-doing. BITTERSWEET.

SUGGESTIVE.

IN these days of bankruptcies and failures, the Prohibition city of Portland, Me., gained in valuation in 1878, $180,000; while Boston, with its wilderness of saloons, lost in valuation $70,000,000. It will not do to say the "almighty dollar" longer, for there is a duty more powerful than the dollar. What is it?

Two Ways of Eradicating an Evil.

A THISTLE took root, flourished, and bore fruit in the fair field of a farmer. The winds of autumn scattered the feathery seed far and wide, and when spring came again, all over the fields and gardens the green plants of the thistle came peeping through the sod.

"This will never do," quoth the farmer; "a thistle plant here and there may be pretty and picturesque, but who wants a harvest of thistles? No other crop can flourish while these vile, crowding things monopolize the soil."

So he set to work bravely to cut down the plants all over the farm, preserving only a few of the thistles in the garden; but alas! these *seed bearers*, with the roots of the old plants, despite all the watchful care of the farmer, brought forth a harvest so plentiful that the poor man was ready to fold his hands in despair.

"You remind me of some temperance workers," said a brother farmer coming forward to the help of the sorrowing man. "Your fields bring forth bad fruit; so does the broad field of humanity. Ever since Father Noah discovered, to his shame and sorrow, the mischief contained in the fermented juice of the grape, the deadly plant has been scattering its poison seed, till the world is full of evil. Now some good and intelligent people say, 'License the high-toned saloons—preserve the garden plants, and put down the low groggeries.'"

"Well, you hit hard my friend. It is a pity if I can't take care of a few plants. They are quite curious and pretty."

"Especially when your land is covered with them so that nothing else will grow, eh?"

"Confound the flaunting things. If they cannot stay where I wish them to I'll turn them out—root and branch."

"A very wise, and the only safe decision."

MRS. E. J. RICHMOND.

IN DEFENCE OF BEAUTIFYING OUR CHURCHES.

DEAR FRIENDS.—Please let me speak a few words in behalf of the sewing girl who was so severely criticised (I might say condemned) by Jacquelina at our February meeting. Our friend must have forgotten about the "Widow's Mite" and how when Moses was building the Tabernacle the women gladly gave their jewelry to him to be made into ornaments for the House of God. I do not suppose the splendor of any of our modern churches equals the magnificence of the Temple built by Solomon. God gave him special directions how to build it, yet Jacquelina would have us believe that He does not approve of our beautifying our places of worship. I believe we should give the best to God for has He not given us every good thing that we possess?

Jacquelina need not fear that she will have to contribute towards the support of that girl, for surely the good Father above will not let her want because she denied herself to help along His cause. I do not believe in people being improvident, but if a girl chooses to give her money for a good purpose instead of spending it on fashionable gewgaws etc, (as most of the girls do who sew, stand in stores and support themselves in other ways) I think she is to be commended for it. There is a happiness and satisfaction in denying ourself for others or for a good cause that the rich can never know. Well! Washtenaw will not have to lament any more that "each writer discharges her load of ideas and retires without provoking any return fire," but I do not write this for the sake of arguing but because I think the weight of Jacquelina's remarks was thrown in the wrong scale. There is too little given to the church and for charitable purposes instead of too much. I was once visiting a very rich family where there were several girls and when we were getting ready for church I had the coin I expected to put in the collection plate on the table, when one of the girls said "Why do you put more than a penny on the plate? *It never do.*" Yet I have seen those same girls spend two and three dollars at a time for candies oranges etc., and think nothing of it. People would be happier if they spent less money for their own selfish gratification and more for the good of others. HELIOTROPE.

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

PEN THOUGHTS FROM EVERY-DAY HOUSE.

ANNIE L. JACK.

"THE strange sweet days are here again,
The happy, mournful days.
The songs that tremble on our lips
Are half complaint, half praise."

THIS verse always comes to my mind as spring draws near when the mid-day hours resemble the soft, balmy spring days, and the evenings and mornings are sharp reminders of winter. The busy housewife seems to find the lengthening days all too short as the remodeling of spring garments occupies her time and she is apt to wish that dinner and tea did not follow each other in such rapid succession. A very useful and labor-saving plan is to prepare stock for soup beforehand and keep it ready for use. The basis for Julienne soups can be made as follows:

Put into a stew-pan four pounds of shin of beef or knuckle of veal, any bones, trimmings of poultry or other meat, two ounces of butter, two onions, each stuck with cloves and unent, one turnip, two carrots, one head of celery, salt, pepper, mace, and a bunch of savory herbs, with four quarts of cold water. Rub the butter over the pan before putting in the ingredients; cover all closely and place over a sharp fire, stirring occasionally. Simmer five hours. Remove all scum and strain through a fine sieve. For all ordinary purposes this stock is very useful, can be available when one is not in the humor for cooking, or unexpected company makes an additional course needed, when soup has not been especially prepared.

A nice relish for those fond of such things at this season, is common garden *cress*, which can be raised to cutting-length in any sunny window during March or April. It is a pungent ingredient in a winter salad, which can be nicely made of a tender beet leaf, a few stalks of celery and a little cress, chopped together and mixed with a little vinegar and cream. The cress makes a very nice tea dish to be eaten with bread and butter. It is no trouble to grow it. Ours sown in sand, in a saucer, was ready for use in fifteen days.

Eggs are now coming in quite freely and form one of the luxuries that can be enjoyed by any farmer's family. There are so many ways of cooking them, that I almost hesitate to give one that if tried faithfully will, I am sure, give satisfaction. It is poached eggs with cream. Put into a frying-pan one pint of water, a pinch of salt and two teaspoonfuls of vinegar; break each egg to be used (this quantity cooks four) into a teacup, and when the water boils, slip the egg gently in without breaking the yelk. Simmer three or four minutes and, with a slice, lift them out, place on a hot dish and trim the edges. Prepare at the same time in a saucepan, half a gill of cream with salt and pepper, brought to the boiling-point; add an ounce of butter broken into small pieces. When this is well-mixed, pour over the eggs and serve. Small pieces of dry toast cut into one particular shape and placed round the dish, add to its appearance, and are very good. In this way, with a little care and not much more trouble, the simplest dishes can be made palatable, and at no time of the year is this more needed than in early spring, when the appetite is often variable, and we begin to miss the full store of winter, and cannot yet attain the richness of the summer fruits which, if there is, as there should be, a full supply in every farmer's garden, render us during the heated term half-independent of the kitchen fire.

LOG-CABIN SKETCHES; OR, JESSIE SEABRIGHT'S DIARY.—No. 3.

MAY MAPLE.

Home-made Conveniences.

How much I have longed for my old, easy sewing-chair, since we have been in our new home; and then I have wondered how those old friends, away East, could get along, year after year, with only those hard, old benches and stools. I remember I used to think when seated on one of them, that if I were so poorly off for chairs, I would do without other comforts till I had comfortable seats in my house, for myself and my guests. And yet I don't know what they could dispense with; for they had neither luxuries nor fineries, and only food enough to keep hunger from the door, and clothes enough to cover them decently—not enough to be well clad on a cold day, for the children were often compelled to remain at home, when they should have been in school, for the want of boots, shoes and comfortable wraps. We are well fed and comfortably clad for winter or summer; but the prospect for even a new set of chairs, is very slim for a long time to come. Is it a judgment upon me for thinking unjustly of others? If there were only some way for me to earn a few dollars; but my neighbors are all like myself—too poor hire work done. The country is new, and every dollar must be saved for farm improvements and family necessities.

A few hours later,

"I'll do it! I'll do it!" I exclaimed, as I threw down an old number of the RURAL NEW-YORKER, which I had found in a trunk upstairs. Mother had put in a whole year's subscription, when she was helping me "pack up" for my new home, saying: "They will help you to pass away many an otherwise lonely hour; and, no doubt, you will gather from their pages many hints that will assist you in your life journey." And I have found a number that suggests what will be to me a luxury; and yet it is so simple and easily made that I wonder I had not thought of it before finding the hint in the paper."

Barrels, hammer, hand-saw, a few short nails, a piece of rope, a bit or small auger, one of the old quilts that mother gave me when mine were burned, till I could make new ones, an old double-skirted dress, and a few hours with busy fingers and active brain, and behold! my room is adorned with two luxurious easy-chairs, fit even for a farmer or an editor to rest his weary self in, after a hard day's-work.

"Now you and pa have bof nice chairs; can't you make one for me out'n somfin'?" says Bertie. And I answer, "Yes, my boy. There's that long shoe-box that papa brought home full of groceries the other day, I think I can make a nice, little, high-back chair for you out of that. I'll set it up on one end, take out the upper-end board, and saw off the side boards about half-way down, put in the seat-board about six inches lower down, so that the side boards will come up high enough for arms; nail a slat across the front just below the seat, to make it strong; then cushion and cover it with some calico like my big apron. Then I guess Bertie will have a very good resting-chair."

"When will you make it, mamma?"

"To-morrow, if we are all well, and nothing happens to prevent."

DOMESTIC RECIPES.

French Pound Cake.

Five cups of powdered sugar; two cups fresh butter; two cups sweet milk; six eggs; ten cups dried and sifted flour; three nutmegs; teaspoonful of soda; one pound raisins; quarter-pound of citron. This makes four loaves. Bake one hour and then ice them.

Lemon Snaps.

One cup of butter; two cups of sugar; one-third cup of milk; three eggs; two teaspoonfuls of lemon extract, and one of soda.

URSULA.

QUESTIONS ANSWERED.

Hoe-Cake.

Mrs. D. L. B., wishes to know how the genuine Southern hoe-cake is made.

ANS.—It is simply corn-meal and sweet milk, with a little salt added, stirred to the thickness of a stiff batter, spread on a baking-pan and tipped up to bake before an open fire. The name "hoe-cake" originated from the fact that on the plantations this cake was often baked upon the broad field-hoes.

To Color Madder-red.

Reader wishes a recipe for the above.

ANS.—Three pounds of madder, one-half pound alum and one pound of cream-of-tartar to ten pounds of woolen cloth. Dissolve the alum and cream-of-tartar together in water to cover the cloth. Put in the cloth, boil up and let remain on the back of the stove for two hours. Then wet the madder in warm water and put into a boiler of clean water; when blood-warm put in the goods wrung out of the alum and cream-of-tartar water and keep stirring until the dye is boiling hot; let remain in for three hours, after which take out the cloth, stir into the dye one quart of soft-soap, put the goods back and let stand until cool. Then rinse and dry.

To Keep Eggs.

Mrs. R. L. asks how eggs may now, while cheap, be preserved so as to be good for cooking purposes next fall and winter.

ANS.—To keep eggs for any length of time it is necessary that they should be fresh at the time of packing and that the pores of the shell should be sealed air-tight whether by dipping into melted suet or wax, flax-seed oil, a solution of gum-arabic or any air-proof varnish and then packing in bran, oats, salt, or charcoal powder. Another method, and perhaps the most common, is to pack the eggs in a stone crock or half-barrel, covering with a solution of lime, salt and water. One pound of good stone lime slaked in two gallons of pure water with a pint of salt added when cold, will be found about the right proportions. If the lime be too strong it will destroy the shells. Pack the eggs into the crock, small end down, and be careful to reject any eggs that may be cracked. Pour over them the clear lime-water free from any sediment. See that all are under the solution. Cover the crock tightly and place in a cool temperature where they will not be disturbed until wanted for use.

News of the Week.

MISCELLANEOUS.

Monday, March 31, 1879.

IN Congress nothing has been done in the way of legislation; but a good deal in the way of President-making. It should be impressed on our Representatives that there is ample time for the latter, and that the main thing the country needs at present is either to stop law-making, so that the industries of the nation may have some firm basis for investing capital; or, better still, to pass laws to foster and encourage those industries. There is a great likelihood that the extra session of Congress will be prolonged much beyond the time at first supposed necessary and that both parties will draw fat salaries, not for promoting the good of the united nation, but for advancing party interests.

There seems to be an absolute necessity that the hangman should soon be busy in some parts of the country, especially in the South. A little over a week ago, a drunken desperado, in Marshall, Texas, shot and killed, without a particle of provocation, a member of a Northern theatrical company, who had been acting in the town and were just waiting for the midnight train that was to carry them out of the State. Another member was dangerously wounded by the ruffian, and one of the actresses only saved her life by piteously entreating the scoundrel's forbearance. He was from Kansas, has few friends in the Lone Star State, and as a good deal of excitement has been aroused thoughout the country by the outrage, it is not impossible that his crime will bring him to the halter. At Frankfort, Ky., Thomas Buford, a high-toned gentleman, who had already, with immunity, attempted his brother's life, and gained a reputation in other ways as a dangerous character, shot to death Judge Elliott, who, with other members of the court, had recently decided against him in a case involving a large sum of money. In Richmond, Va., a young blood, feeling agrieved because a young lady friend conceived herself insulted by a clerk in a shoe-store, went with his brother to horsewhip the insulter, and because the latter objected to the proceeding, shot him dead. These are only a few specimens of the cases that call for the hangman's interference.

FOREIGN.

In Egypt, the Khedive has been so criminally extravagant, that the debts he has piled on the country are so heavy that it can pay neither principal nor interest. The fellahs, or peasantry of the country, are ground to the dust by enforced labor from which they are allowed only just enough to keep body and soul together. They can never save anything, so that when misfortune happens, they have nothing to fall back upon. The Nile, as stated here at the time, rose unusually high some months ago and now famine has resulted from its overflow. In some villages, the naked inhabitants are eating grass, roots, offal and anything that will prolong in pain their wretched existence. Vast numbers, especially in Southern or Upper Egypt, have died of starvation, and that entire part of the old "Granary of the World," is a scene of misery and death. Meanwhile, the ruler whose costly dissipations, wild speculations and gross misgovernment, have brought these horrors on his people, has fallen under the control of representatives of his English and French creditors, who collect the taxes, make all outlays and are trying to pay something to those who loaned the old reprobate the wherewithal to indulge in his excesses. Of course, the income of the latter is pinched somewhat, and he is now plotting and scheming once more to get the finances of the country into his own hands. His chief grievance at present is, that while his subjects are enduring unutterable sufferings, he has actually been deprived of 600 of his harem women who have been married off to the under-officers of his army.

In England, strikes and distress are still rampant. From present indications it would seem that in agricultural matters a radical change must soon take place. Already those who invest as landlords in the purchase of farming property, only get from 1½ to 2 per cent. on their capital; yet tenants seem unable to make a livelihood paying the low rent that yields only so small a return. Farms are going begging for farmers to work them; and the cry for "protection" for home productions is gradually growing louder all over the kingdom. No fresh news of importance either from the Zulu or Afghan war. In France the main question at present seems to be whether the Legislature shall move from Versailles to Paris. The Assembly has voted for the measure, but the Senate is opposed to it. The movement means simply a concession to the radical, red-hot republican faction, and while it will please the inhabitants of Paris and other large cities, it is sure to arouse apprehensions among the more conservative dwellers in the country. The thing is more important as an indication of the tendency of the government than on account of the direct consequences that may result from it.

HERMAN.

$25 in Doctor's visits, will do you less good than one bottle of Hop Bitters.

A Household Perfume. Every family able to appreciate and enjoy the pleasure afforded by a really healthful and delicious perfume, should supply themselves with the genuine MURRAY & LANMAN'S FLORIDA WATER. It is the most delightful and most lasting of all fragrant Waters.

Bronchitis. Throat Diseases often commence with a Cold, Cough, or unusual exertion of the voice. These incipient symptoms are allayed by the use of "*Brown's Bronchial Troches*," which if neglected often result in a chronic trouble of the throat. **25c. a box.**

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, March 29th, 1879.

BEANS AND PEAS.—There is a fair export demand for marrows at late rates. Mediums are firm, choice something in sellers' favor. Red kidneys have become good property again; stock concentrating and very firm at the advance noted. White kidneys and pea only nominal; black firm with small sales. Green peas have advanced under the West Indian demand; quoted at $1 $1.50@1,55. Southern B. E. without special inquiry at $2.50 per 2 bush. bag. Canadian, in bulk and bond, 72@73c. Medium beans, choice, $1.30@1.35; fair to good, $1.15@1.25. Marrow, prime, free on vessels, $1.40; fair to good, $1.20@1.35; pea, $1.20@1.35; white kidney, $1.35@1 60; red, $2.40@2.70; black, $2 10@2.50. California Lima, $4@4.25.

Receipts for week, beans, 2,940 bush.; exports, 973 bbls.; do. peas, 930 bush.

BUTTER.—The market is without new feature, and is not likely to exhibit much steadiness while we are between the two crops. Old is scaling down every day to prices that help to get it out. No selections of State above 18c., and best line dairies can be had at 15c. Now white is lower, Western creamery which shows grain strength as firm as before. The quality of new State is not regularly good. Farmers make the usual mistake of shipping carelessly made weak stock, thinking the word *new* will sell it. These inferior grades are slower, if possible, than poor old. Even the best hay butter falls off in price, if it misses sale a day or so. There will be a liberal offering of new this spring, as it is likely that cheese-making will not be hurried, and as prices will rule in buyers' favor, best grades will realize most money for producers.

NEW BUTTER.—State pails and half tubs, choice, 20@22c.; good, 16@18c.; Welsh tubs, 16@17c.; very poor, 9@14c; Western Creamery, extra, 28@29c.; fair to prime, 23@27c.; poor, 19@21c.; imitation, 17@21c.

OLD.—Best half tubs, 17@18c.; fair to prime, 12@16c.; dairies, full, 12@15c.; do., firkins, 10@15c.; common State 7@9c.; fair to best; State creamery, best, 18@20c.; poor, 12@15c.; Western dairy, 14@17c.; indle packed, selected, 14@15c.; factory, do., 13@15c.; other, 6@10c.; grease, 4@4½c.

Receipts for week, 19,993 pkgs.; exports, 6,911 pkgs.

BRESWAX moves out slowly but quoted steady at 24@25c. for Western and Southern.

Exports for week, 2,378 lbs.; since Jan. 1st, 11,978 do.; same time last year, 30,860 do.

BROOM CORN.—Receipts are small and prices are held very regular.

Short broom, choice, ₹ lb., 5½@6½c.; do. common good, 4½@5½c.; hurl, good to choice, 3½@4½c.; do., common to fair, 3@3½c.; red and crooked, 2@3c.

CHEESE.—The stock is larger than desired at this late period, and an effort to sell with a moderate export trade, gives irregular prices; partly this and also from deterioration of quality from long holding, has given a decidedly lower range for some grades, as compared with several weeks since. Most of the business is in low grades at from 4 to 6c. The quotation of really fancy stock is rendered somewhat nominal by their scarcity.

The quotations are: 8c. for fancy; 8¼@8½c. for fine lots; 7¼@7¾c. for good; 3@4c. for skimmed; 5½@6c. for half skimmed; State, farm dairy at 8@8¼c. for fine; 7@7½c. for good to prime. Wisconsin factory, fine and fancy, at 8½@9c.; do. good to prime, at 7½@8¼c. Western factory, fine 7¼@7¾c.; good and prime, 6¾@7c.; do. full skimmed, 3@4c.; do half skimmed, at 5@6c.

Receipts for week, 18,733 boxes.

Liverpool cable, 40s.

Steam to Liverpool, 30s.

Estimated stock of cheese in this city, 100,000 boxes

COTTON.—The Liverpool market has been better, and there has been a much more active movement here with prices higher. Closing prices are for March, 10.53c.; April, 10.54c.; May, 10.55c.; June, 10.81c.; July 10.94c.; August, 11 02@11.03c.; September, 10.85@10.86c; October, 10.53@10.54c.; November, 10.26@10.28c.; December, 10.19@10.25c.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted:

	Uplands	*N. Orleans.*	*Texas.*
Ordinary	8 13-16	8 15-16	8 15-16

STAINED.

Good ordinary	8⅞	Low Middling	9⅜
Strict good ordinary	9⅜	Middling	10 3-16

DRIED FRUITS.—In apples export interest has diminished and there are freer sellers of quarters at rather easy prices; best sliced and evaporated stock have a good demand and prices firm. Peeled peaches are in good demand and rule firm. Blackberries are dull; other small fruits are unchanged.

Alden's evaporated apples are at 12c.; Williams's at 11@11½c.; new process apples at 9@10c. State plums, 14@14½c.; blackberries quoted at 4½c. Peaches—Peeled Georgia, 7@7½c. for poor; 8½@9½c. for fair to good; 10c. for prime; choice North Carolina, 12@13c.; good do., 9@10c.; unpeeled halves, 3@3½c. quarters, 2½@3c. Pitted cherries, 20c. Apples—New, 2¼@2½c. for southern quarters in bags; 3½@4½c. for prime sliced; do., fair at 3@3½c. State at 3½@4½c. for new sliced; and 4@4½c. for quarters; Western at 3½@4½c. for new quarters. Raspberries, 26@27.

Exports since Jan. 1st, 14,729 bbls. apples; same time last year, 2,593 do.; showing an improved business.

EGGS.—Receipts for week, 14,187 bbls.; do. last week, 9,917 do. The quotations of the close have ruled steady most of the week. Prime barreled stock still holds the preference. Dealers look for steadier business than was noted last spring when the market was so severely glutted. A good trade for Easter is expected at the latter part of next week unless holders injudiciously crowd up prices. Country shippers should buy with a view to fair New York rates.

Near points, 15@16c.; State, 15c.; Western, 14½@15c.; Southern, 14@14½c.; poor stock, 13@13½c.; duck, 23@24c. goose, 45@50c.

FRESH FRUITS.—Rail arrivals continue free and sudden advances are thus prevented. Single barrels of extra Spitz, make $2.75; but commercial loads are quoted as high as they will bear; Spitzenburgs, $2@2.75; Greenings, $2@2.25 for State; $1 75@2 for Eastern; Russets, selected, $1 62@2; Baldwins, $1 75@2; Eastern lots range, $1 25@1 50. The retail trade is somewhat curtailed by cheap and good business. Cranberries dull; bakers use a good deal of picplant instead. Made barrels, $7@8 50; crates, $2 25@3. Strawberries are lower but not yet down to a quick rolling rate; 60@70c. quart. Florida oranges scarce, fancy half-barrel boxes, $5 50; inferior to fair, $2@4 50; hot-house strawberries, $1 50@1 75. Peanuts firm with another advance; fancy Va. hand-picked, $1 20@1 25; other, 90c.@$1 10; pecans, 6@8c.

Exports of apples for week, 7,211 bbls.

FLOUR.—The advices from the other side have been more encouraging to exporters, who have been buying quite freely. Home demand is moderate. There are free sellers on full supplies at steady figures.

Quotations are $3.35@3.70 for inferior to very choice superfine State; $3.70@4.00 for very poor to good extra do., odd lots and lines; $4.00@4.25 for good to choice do.; $3.35@3.70 for inferior to fancy superfine Indiana, Iowa, Michigan, &c.; $3.70@4.00 for inferior to good shipping extra do. and $4.00@4.25 for good to choice extra do.; common to about choice white wheat extras, $4.25@5.35; choice to fancy do. at $5.35@6.15; red and amber winter wheat, very inferior to very choice trade and family, at $4.10@5.75 (fancy held higher); round hoop Ohio at $3.90@4.35, and trade and family brands of do. at $4.30@5.85, the latter rate for very choice (a few fancy lots held higher); St. Louis, $4.25@5.10 for very inferior to good extra; $5.10@6.00 for good to very choice (with a few very fancy brands in high favor with the jobbing trade) quoted up to $6.50@6.75; Minnesota clear, very inferior to very fancy, at $3.75@5.10; few brands going above $4.75; Minnesota "straight," very poor to very fancy at $4.50@6.00; and patent poor to strictly fancy at $5.25@8.25, few brands going above $7.50@7.75; unsound stock at from $2.25@5.25; city mill extra at $4.85@5.20 for West Indies (the latter rate for fancy in new packages); do. for England $3.80@4.00; do. trade and family extras, $5.25@6.25; do. for South America, $5.15@5.65 for fair to

very choice: No. 2 at $2.35@3.15 for poor to very choice.

GRAIN.—Wheat has shown only a moderate export movement, with prices variable, closing easy. Latest sales are of No. 2 spring at $1.02½@1.03; No. 3 spring at 94@95c.; No. 4 spring at 90c.; rejected spring at 78@79c.; ungraded spring at 91c@$1 03; Nebraska spring at $1, delivered; ungraded amber at $1 12@1 13½; No. 2 amber at $1 12½@1 13; No. 1 red at $1 15½; No. 2 red at $1 14½@1 15; No. 3 red at $1 10; ungraded red at 92c.@$1 14; ungraded white at $1 12@1 13; White State at $1 14½; No. 1 white at $1 13@1 13½; No. 2 amber, April option, at $1 13; No. 2 red, March option, at $1 15; do., April option, at $1 15½; do., May option, at $1 15½@1 16; No. 1 white, March delivery, at $1 13½; do., April option, at $1 13½; do., May option, at $1 14. Corn has been fairly active and about steady. Latest sales are of New York No. 2 at 45¾@45½c.; New York No. 2 old at 46@46½c.; New York steamer mixed at 45c.; ungraded western mixed at 44@45½c.; No. 3 quoted at 44½@44¾c.; New York steamer white at 46c.; New York steamer yellow at 45½c.; roundyellow at 46c.; New York No. 2 white at 50@51c. for old; Jersey yellow quoted at 46c.; No. 1 white quoted at 49@50c.; yellow western at 46c.; white western at 48½c.; New York No. 2, March, at 45½c.; do., April, at 45½c.; do., May, at 46½c.; steamer mixed, March, at 45c.; do., April, at 44½c.; do., May, at 44½c. Oats are not active and have rather favored buyers, closing firm, however, at for New York No. 1 at 32@32½c.; New York No. 1 white at 36c.; New York No. 2 at 31½c.; New York No. 2 white at 33¾@33½c.; No. 3 quoted at 31½c.. New York No. 3 white at 32@32½c.; No. 2 Chicago, afloat, quoted at 32@32½c.; do., in store, quoted at 30½c.; white State at 35@40c.; mixed State at 42½c.; white western at 31@35½c.; mixed 31@32c. Barley nominal; State, 6-rowed, 70@80c.; do., 2-rowed, 55@65c.; Canadian, 90c.@$1 05.

MAPLE SUGAR.—Demand rather better than usual for the early part of the season. Prices not strong. Vermont, 14@15c.; Ohio, 10@11c.; old, 6@8c.

HAY AND STRAW.—Receipts are not excessive, demand fair, and prices well sustained.

Sales at 40@45c. for shipping, and 70@80c. for retail qualities. Straw quoted at 40@45c. for long rye, and 35c. for short rye, and oats at 35@45c.

Exports since Jan. 1st, 15,649 bales; do., last year, 17,230 do.

HOPS.—The demand this week has run almost entirely upon low and medium grades at from 5@7c., and as a good many useful hops could be found at the latter figure, buyers did not care to look at higher priced goods. Shipments have been 370 bales.

Quotations are for New York's, new crop, choice, 9@13; New York's, new crop, medium, 7@8; New York s, new crop, low to fair, 5@6; Eastern, 6@9; Western, 6@9; Yearlings, 2@4; Olds, all growths, 1@2; Pacific coast, 10@14.

LEATHER.—Hemlock sole is quoted at 18@19½c. for light; 18½@21c. for middle; 19@21c. for heavy; and 14@18c. for good damaged.

OIL CAKE.—Western is quoted at $27@27.50 per ton.

PROVISIONS—Have shown rather more firmness on a better inquiry. Mess pork closed at $10.25 bid and $10.35 asked for new for March, $10.20 bid and $10.30 asked for new for April, and May at $10.30 bid and 10.40 asked, and June at $10.40 bid and $10.50 asked. Bacon at 5½c. for long clear and 5½c. for short clear. Lard—Western steam at $6.52½ for spot lots; $6.50@6.52½ for March and April; $6.57½@6.60 for May, and $6.62½@6.65 for June. Stearine at 6½@6½c. Tallow at 6¼@6 9-16c. for prime. Beef Hams at $18@18.50.

POULTRY AND GAME.—Southern spring chickens have sold at 75c. $1 pair. fowls and turkeys firm and higher. N. J. fowls, 12@13c.; western, 11@12c.; southern, 10½@11½c.; roosters, 5½@6½c. Turkeys, N. J., 13@14c.; western, 12@14c. Ducks, choice, 95c@$1; other, 65@75c.; choice geese, $1 75@2; southern and western, 75c.@$1.87. Pigeons, 35@40c.

Dressed poultry in good demand; very few poor lots in market. Frozen makes a very acceptable offering. A noticeable point in the N. Y. spring market is the prolonged use of turkeys. Capons higher. Frozen turkeys, choice, 19@20c.; fair to good, 17@18c.; frozen chickens, 11@12c. Dry-picked winter chickens, 9c.

Turkeys, best, 19@20c.; the latter for Pa. dry-picked; other, 14@18c.; chickens, best, 15c.; other, 11@15c.; fowls, choice, 13@15c.; capons, 26@27c.; slips, 22@24c.; ducks, best, 16@17c.; other, 14@15c. A few State chicks, 8@10c.

Eng. snipe are the best fancy birds in the market, they sell readily at $1 50@1 62. Plover also; small snipe, 50@90c. Wild pigeons lower, $1@1 12 for Missouri; quality not good. Wild ducks dull generally of thin, rough grade. Canvas-backs, 50c.@$1, the latter for Have de Grace; Red heads, 50@75c.; Mallard, 40c; Black, 25@30c.; Teal and common, 15@25c. There have gone to Europe from our market since Jan. 1st, 493 pkgs. game.

SEEDS.—Clover is slow and easy in price; Western quoted at 6¼@6½c. for prime and choice. Timothy is slow, quoted at $1.30@1.40.

SUGAR.—Refined at 8½c.; crushed and cut loaf, 8¼@8¾c. for granulated and powdered; 7¾@8¼c. for soft white and 6@7½c. for soft yellow.

TOBACCO.—Exporters are doing but little, and the home trade is slack; values are a little unsettled, but show no quotable change.

VEGETABLES.—Exports potatoes, past week, 2,875 bbls; of onions, 50 do. Potatoes steady; strictly choice seem scarce: holders certainly would not keep them from the trade at this late date, Southern truck is pushing old northern aside.

Bermuda onions, $5@6 crate; do., beets, $1.50@1.75 crate. Norf. onions higher. Charleston asparagus, $7@7.50 doz. Florida green peas, crate, 50c.@$2; Virginia kale, 50@75c. bbl. do. spinach, $2@2 50; Baltimore, do, $1.25@1.50. Virginia radishes, $1.25@1.50. Hot-house rhubarb, ₰ 100, $4@5; radishes, $3.50@4; cucumbers, $2@4.50 ₰ doz.; mushrooms, ₰ lb., 50c.; lettuce, selected, 25@75c. ₰ doz. Bermuda potatoes, choice, $8@9 per bbl.; Early Rose, Nova Scotia, $3@3.25; Eastern, $3@3.25; State, choice, at $2.50@2.75; fair to good, $2@2 25; Peach Blow, white, in bulk, $2.50@3; red, $2.25@2 75; Prolific, $2.25@2.75; Peerless, State, $1.75@2; in bulk, $3@3.12; Jackson white, $2@2.37; Mercer, $2.25@2.37; (outside rate per double heads). Sweet potatoes, Md. & Del., $2 50@2.75. Bermuda tomatoes, 90c.@$1 box. Onions, Eastern, white, ₰ bbl., $4@6, red and yellow, $4@5; Chester, $4@4.50. Squash, Hubbard, $3@3.50; marrow, $3. Cabbages per 100, $4@6; R. turnips, per bbl., $1@1.25; beets, 75c.@$1.00; carrots, $1@1.12; celery, per doz. bunches, 50@75c.

WOOL.—As the season for the new clip approaches, and especially as there is nothing encouraging in the position of the goods market, prices are unsettled and rather easy on other than the best grades of fleeces.

LIVE STOCK MARKETS

Saturday, March 29, 1879.

BEEVES.—Receipts for the week, 9,390 head; do., last week, 7,689 do. Prices have held up well regardless of increased receipts. Quotations fell to the present point last Wednesday and the business has ruled steady. A car-load of extra Illinois, 1,578 average, sold for 11c., dress 57 pounds. The ruling top figures were 10½c., to dress 56 pounds; ordinary to heavy steers, 8½@10½c., dress 55@56 pounds.

Exports for week, 6,120 quarters beef; of mutton, 1,500 carcasses.

COWS AND CALVES.—Very few prime milkers are showing, in fact with the new butter season opened good stock is worth quite as much at home as here. Nominal range, fair to good, $35@60.

VEAL CALVES.—Hog dressed calves abundant and low. The weather will soon have a souring effect upon this class of stock, and holders have fresh sales. Extra, 8c.; fair to prime, 5½@7½c.; inferior or small, 3@4c. Live calves easier, though not in heavy receipt. Choice State and N. J., 6c.; fair to good, 5@5½c.; poor, 3½c.; bobs (when saleable), $1.02 per head.

SHEEP AND LAMBS.—Receipts for week, 18,416 head; do. last week, 22,323 do. Good sheep are firm at 5½@6¼c. for Western; N. J. ewes, 5@5½c. Winter lambs, 5¾@6½c.; spring lambs, fancy, $6 ₰ head; other, $2@5.50.

SWINE.—Receipts for the week, 25,757 head; do. last week, 18,536 do. No late sales reported; a recent range was 4@4½c.

Dressed hogs in light supply, not largely wanted; country, light, 6¾@6¾c.; medium, 6@6¼c.; heavy, 5¾c.; city, 5¾@5¾c. Pork tenderloins, 9c.

Sole Manufacturers, PHILADELPHIA.

HORSFORD'S
Bread
Preparation

UNSURPASSED FOR MAKING
LIGHT BREAD,
Biscuit, Rolls, Cake and Pastry.

It is Better and Healthier than ordinary Baking Powder, Cream Tartar or Yeast.

The cost of raising Bread, Biscuit, &c., with it is only about half as much as by ordinary Baking Powder, and the result is much better.

It restores the nutritious elements which are taken from the flour in bolting. No ordinary Baking Powder or anything else used for raising bread does this.

Universally used and recommended by prominent Physicians.

If you cannot get it of your Grocer send a three-cent stamp to the manufacturers for a sample.

Manufactured according to the directions of Prof E. N. Horsford, by the Rumford Chemical Works Providence R. I.

A GREAT OFFER!!! 100 PIANOS AND ORGANS at EXTRAORDINARY LOW prices for cash. SPLENDID ORGANS $35, $40; 5 Stops $45, 7 do $50, 9 do $55 & $60, 11 do $65, 12 do $70, 13 do $80. 7 Octave SQUARE AND UPRIGHT PIANOS $125 do $130, 71-3 do $140, not used SIX Months. Warranted 5 years. AGENTS WANTED. Illustrated Catalogues Mailed. Music 1c. per page. HORACE WATERS & SONS, Manufacturers and Dealers, 40 East 14th., Street, New York.

LITTLE HARRY'S LETTER.

A POSTMAN stood with puzzled brow
And in his hands turned o'er and o'er
A letter, with address so strange
As he had never seen before.
The writing cramped, the letters small,
And by a boy's rough hand engraven.
The words ran thus: "To Jesus Christ,"
And underneath inscribed, "In Heaven."

The postman paused; full well he knew
No mail on earth this note could take;
And yet 'twas writ in childish faith,
And posted for the dear Lord's sake.
With careful hand he broke the seal,
And rev'rently the letter read;
'Twas short, and very simple too,
For this was all the writer said:

"My Lord and Saviour, Jesus Christ,
I've lately lost my father dear,
Mother is very, very poor,
And life to her is sad and drear.
Yet thou hast promised in thy Word
That none can ever ask in vain
For what they need of earthly store,
If only asked in Jesus's name.

"And so I write you in His name,
To ask that you will kindly send
Some money down; what you can spare
And what is right for us to spend.
I want so much to go to school;
While father lived I always went,
But he had little, Lord, to leave,
And what he left is almost spent.

"I do not know how long 'twill be
Ere this can reach the golden gate;
But I will try and patient be,
And for the answer gladly wait."
The tidings reached that far-off land,
Although the letter did not go,
And straight the King an angel sent
To help the little boy below.

Off to his mother he would say,
"I knew the Lord would answer make
When He had read my letter through,
Which I had sent for Jesus' sake!"
Ah! happy boy, could you but teach
Our hearts to trust our Father's love,
And to believe where aught's denied
'Tis only done our faith to prove!

[*National Baptist.*

LETTER FROM UNCLE MARK.

DEAR BOYS:—I am not certain that any one among you will recognize the boy in the picture, but I hope, at least that his employment is familiar to you, and that you all are as studious and improve your spare moments as assiduously as he does. Apparently he has just come in, perhaps, from school or from some errand, and, as he has not removed his hat, he evidently expects soon to go out again, perhaps to feed the sheep, or to water the horses, or to split and carry in the kindlings, or may be to milk, or he is waiting for instructions to go on some errand, or to do any of the many things that nobody can do so well as boys. But he cannot waste the few moments he has to spare. He has picked up a paper, and to judge from his sober features, he reads in good earnest. That boy will some day take a leading position among his fellow men.

Let me tell you that it is just such boys, who seize every opportunity to learn all they can, that become our foremost scientists, who go to the legislative halls to make our laws, who rise above the general level of mankind, and distinguish themselves in every branch of business, in every honorable pursuit. Strange as it may seem, the majority of our great men, those who shape the affairs of the country and of the world, were farmers' boys, brought up on farms, and who, many of them, had to struggle with adversity and hard work before they rose to their present position. The boys that are on farms now, the type of boys shown in the picture, will, in a quarter of a century, be the leading men, socially, financially and politically. Bear this in mind, boys; now is the the time for you to lay the foundation for your life work, and the better you spend your spare moments now, the more influence will you get in the future.

UNCLE MARK.

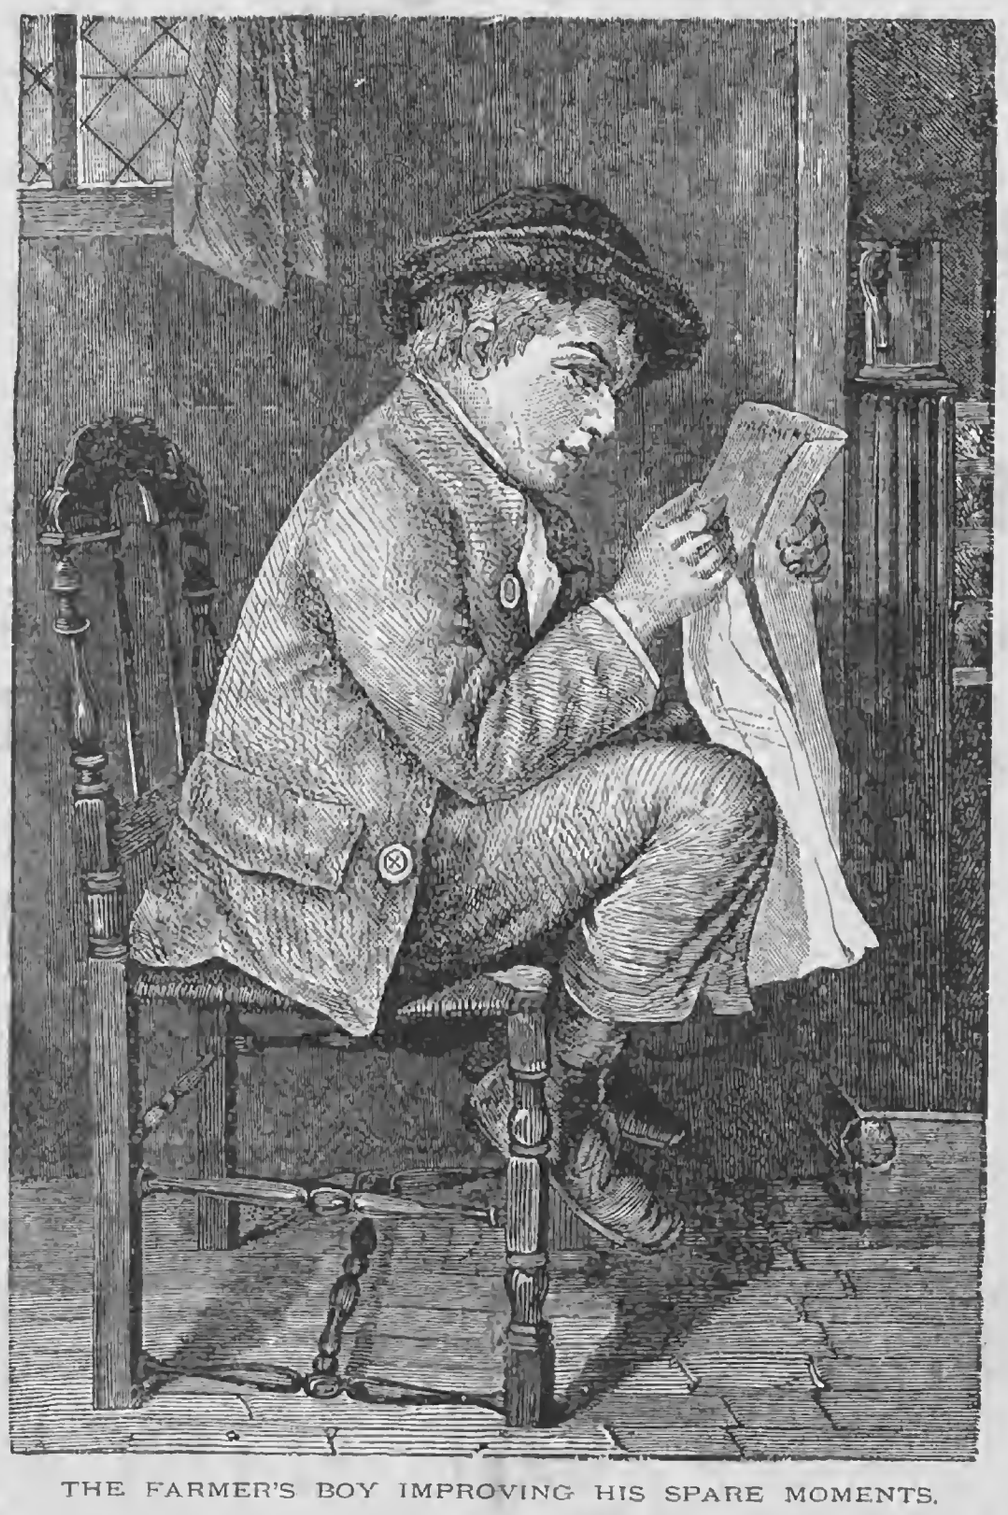
ABOUT TOMMY.

TOMMY is not a naughty little boy who is continually getting into mischief and involving his friends in a variety of unpleasant situations, but a little red lizard that lives, or that did live, in my aquarium. I named him Tommy, after one of Kingsley's "Water Babies," for he always reminds me of a little baby, with his pink skin and tiny hands. In color he is salmon pink, paler underneath, and the head, back, and outside of the legs, are thickly spotted with black. In form he is very slender and graceful, but his small, pale, brown eyes are very ugly. The name of this species is Spelerpes rubra, or Red Chameleon, and it is commonly found in running streams or springs; but it is not very common in this part of New Jersey. Like most of the reptile tribe, Tommy is easily affected by music. On hearing the sound of a piano, or even of a person whistling, he comes to the top of the water, and slowly turns his head from side to side. I treated him exactly like a gold-fish, not placing any food in the water at all, but letting him feed himself. He certainly thrived under my treatment, for during the nine months I kept him, he grew at least half an inch.

The plants in the aquarium were several sprays of Mermaid Weed, common in most ponds, and a pot of Aponogeton. Tommy appeared to have a great affection for the last named plant, and spent many hours coiled up on its pot. Another favorite position was to hook his tail over a floating branch of Mermaid Weed, and hang downwards in the the shape of Hogarth's line of beauty, a long S. In this position, with his small, pale eyes upside down, he looked very malicious, not to say goblin-like.

Alas, he will amuse me with his eccentricities no more! During a period of domestic disorder, consequent on moving, he was placed in a greenhouse, and one morning he was missing. Whether he had climbed out of his jar, and paid the penalty of his rashness with his life, like many other adventurers, or whether some predatory, but short-sighted cat mistook him for a gold-fish, and seized him, is a mystery; he has never been seen since. Peace be with him! E. L. T.

Maywood, N. J.



THE FARMER'S BOY IMPROVING HIS SPARE MOMENTS.

THE LITTLE SENTINELS.

KING Henry III. of France was in the habit of spending every year large sums upon pet dogs. Among these he had three favorite lap-dogs, called Lilline, Mini, and Titi. These little animals, which were very beautiful, and had been brought with great trouble and expense from Turkey, were such darlings of their master that the King used to keep them in a basket hung by a splendid chain from his neck. He even trained his little dogs to act as sentinels, and keep guard over him when he slept. Stationed beside the head of the King's bed, the three little dogs stood sentry in turn, each for a time standing on its hind legs, and supporting itself against the tester of the bed, which served instead of a sentry-box. The sound of a whistle—a very welcome music, it may well be believed, to the poor little tired dog—told each small sentinel in turn that the time of its watch was up, and it might go to rest. Before doing so, however, it gave a little gentle bite to the ear of its sleeping companion whose turn came next. In this manner Lilline, Titi and Mini kept up by turns an uninterrupted watch over the King, from the time he went to bed until morning; and he could not have had a more careful or faithful body-guard.

One of these little animals might have been the means of saving her master's life. Henry III., as is well known, was not a good ruler, and had many enemies. One of these was a priest of the name of Jacques Clement, who came from Paris to St. Cloud on purpose to kill the King. Being shown into the sovereign's chamber, he took out a paper, which, as a pretext, he handed to Henry. Meanwhile little Lilline rushed out from her watch-house and began to bark very loud, for this gentle little creature, who never hurt or attacked anybody, had yet, in some wonderful manner, found out that harm was about to be done to her master. Henry had the dog taken into an adjoining room. She began to bark still louder, and in a short time the unhappy King was found dead, stabbed by Clement to the heart.

A BEAUTIFUL EXPRIMENT.

PERHAPS some of the boys and girls may be interested in the following experiment. It is easily performed, and will give some idea of the manner in which crystals are formed. Remember that the solution is a poison, and must be kept where it can not possibly be taken through mistake.

Procure from an apothecary half an ounce of sugar of lead, sometimes called lead-acetate. Put this into a wide-mouthed bottle, an empty horse-radish bottle will do well, and fill the bottle nearly full with water. When the sugar of lead is all dissolved, push two or three pieces of copper wire into the cork, and let them run down into the liquid in the bottle. Bend the lower ends into hooks, and hang on them a small piece of sheet zinc, taking care that it touches all the wires.

After the bottle has stood for a few hours, crystals of lead form upon the lower ends of the wires. These rapidly increase, and soon the entire bottle is filled with beautiful fern-like crystals. Looking carefully at them, the branches are all found to start out at the same angle, thus showing that the force which produced them acts constantly in the same direction.—*Chicago Standard.*

The Puzzler.

CHARADE.

My first, a most delicious treat,
In many a place abounds;
My second is removed with care
From the thrifty farmer's ground;
My whole, I oft have noticed,
Within my first is found.

PERSONAL ITEMS.

It is now stated that Eugenie sent Prince Napoleon to South Africa to get him away from the low company in which he has been disgracing himself.

Philip Arnold, banker, died at his beautiful home in Elizabethtown, Ky., a few days ago. He is the Arnold whose diamond mine speculation gave the whole world a sensation in 1872. He spent $37,000 for rough diamonds in London, and took them to California. There he found a little unfrequented valley, in which he "salted" his precious stones. It soon became noised about that Arnold had found a diamond valley. He took a bag of the gems to New York and there organized a company, with capital of $10,000,000. Before the fraud had been discovered Arnold got $350,000 in money, and compromised by surrendering half of it.

MACHINES FOR
Threshing and Cleaning Grain and Sawing Wood.

Patented, Manufactured and Sold by
A. W. GRAY'S SONS,
Middletown Springs, Vt.

The machines with the improvements are the result of more than thirty years' careful study and experiment.
The proprietors are the inventors, ever have been and still are the sole manufacturers.
We have labored from the first to produce machines that will be durable, tasty, compact, portable, and that will run with the least possible friction.
We believe that we manufacture the best machine of the kind in the country.
Our machines have never failed to receive the highest award at all competitive exhibitions.
Circulars and Price Lists free. Address as above.

The Charter Oak Swivel Plow.

THE ONLY PERFECT SWIVEL PLOW.

WALPOLE, N. H., April 13, 1878.
HIGGANUM MF'G CORP.:—You wanted to know how I liked the Charter Oak Swivel Plow No. 150. I would say that I have used it on all kinds of land, and think it the best plow I ever saw or used. I have used seven or eight different kinds of swivel plows and this beats them all in doing good work, and draws much easier. I would not exchange it for any plow I ever saw.
Yours in haste, O. J. HUBBARD.

Manufactured only by
THE HIGGANUM MF'G CORPORATION,
Higganum, Ct.

MATTHEWS' SEED DRILL

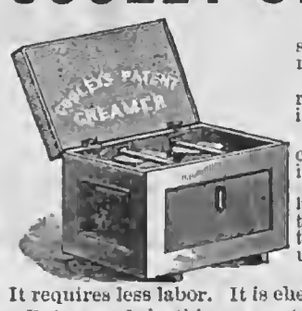
Fort Atkinson, Wis.

COOLEY CREAMER



Supersedes large and small pans for setting milk.
It requires no milk room. It requires capacity for one milking only.
Impure air, dust or flies cannot reach milk set in it.
It makes more butter, because it raises all of the cream, and the quantity is never lessened by unfavorable weather.
It makes better butter. It requires less labor. It is cheaper.
Butter made by this process took the HIGHEST AWARD at the INTERNATIONAL DAIRY FAIR—and brings the highest price in all the great markets.

NORDYKE & MARMON CO.
Indianapolis, Ind.

BLUNT'S PROLIFIC FIELD CORN.

We have been fortunate in seeuring from the originator his entire stock of the above.

Prof. Blunt has made his eorn what it is, by *science.*

First—A thorough knowledge of the *habits* of the plant;

Second—A thorough knowledge of the *laws* that govern the plant;

Third—Its *demands*, viz., what plant-food is best suited to it;

Fourth—Soil, &c.

In regard to the prolific nature of the plant, his theory is, that *every joint that has a groove* should bear an ear, and further, that the *top ear* bears the only true seed, by reason of the close proximity to the tassel, the pollen from which falls upon and fertilizes the silk, and the silk the grain. Acting upon this theory, he has increased the yield of this eorn from one and two ears on a stalk, to from four to six.

J. M. THORBURN & CO.,

Rural Architecture.

A COUNTRY HOME.

QUITE too little attention is paid in this country to our country homes and their surroundings. Well-to-do farmers and gentlemen that live in rural districts are too often satisfied with inconvenient and anything but ornamental homes. The engraving represents a dwelling-house, plain, substantial and convenient, yet ornamental and not expensive. Its elegance does not consist in fanciful ornaments, but rather in the novelty of the design, and its evident fitness for the surroundings. In front we find a few hot-beds, and sashes under which flowers and vegetables may be grown, while the walls of the building are graced with trees and vines, and ornamental shrubbery is in close proximity.

The ground floor (see Fig. 2) provides for the rooms usually found in the lower story. The bed-rooms are on the second floor, not here represented. The front entrance is by the porch, A, leading into a short hall, from which doors lead to the principal rooms. On the right is the parlor, B. The sitting-room is at E and the dining-room at C. At D is a spacious kitchen. H can be used for a milk-room, and K is designed for a wash-room. The rooms are light and spacious, well suited to supply the occupants with all desired conveniences. This engraving originally appeared in a late number of the Gardeners' Chronicle, and is here reproduced with some alterations.

DESIGN OF A CONVENIENT POULTRY-HOUSE.

THE following is a brief but clear description of the ground-plan of a poultry-house, given on page 231:

No. 1. Nest boxes, one foot square, and nine inches high; made higher at one side than at the others so that when the boxes are placed against each other, with the higher side of each coming against the low side of the next, a hen is in a measure, secluded.

2. Roosts, consisting of inch boards, three inches wide, two and a half feet from the floor.

3. A slide door on the inside just large enough to admit of the droppings being shoved through it into a box or wheelbarrow on the outside, provided the building is high enough for that purpose.

4. An opening for the entrance and exit of the fowls. The little trap-door on the outside, is raised or lowered by a string passing inside over pulleys, and held by a nail when open.

5. Feed boxes, three inches wide, two and a half inches high, or deep.

6. Sitting, or hatching boxes, after the style of an old-fashioned writing desk, with sloping cover to shed rain, or to be lifted up when necessary. In one side is an opening large enough to pass in and out. If thought best, it may be without a bottom, the nest being on the ground inside.

7. A box, open at one end; tolerably long, and otherwise large enough for a hen to occupy with her brood during the night, or through a storm.

8. The entrance to a long and narrow passage, formed by strips nailed to cleats under the floor at the rear end of the building. This is the prison for hens it may be desirable to break of their sitting propensities.

9. A square iron dish for water.

D, doors; W, windows—sliding.

My principal objects in this design have been cleanliness, and a quick and easy adaptability. On entering the building, you enter an apartment quite fit for anybody's reception, it being perfectly clean. You have only to stoop a little, slip your hand between the slats in front of the nests, and take out the eggs. The short white lines seen along the frame-work in this part of the interior, are narrow strips nailed to cleats on the floor, and carried to, or near the roof inside, fastened half way up to a cross frame, to make it firm. These strips are four inches apart. It will be seen that the feed boxes being placed on the side of this fencing opposite the fowls, the latter can readily put their heads through and eat out of

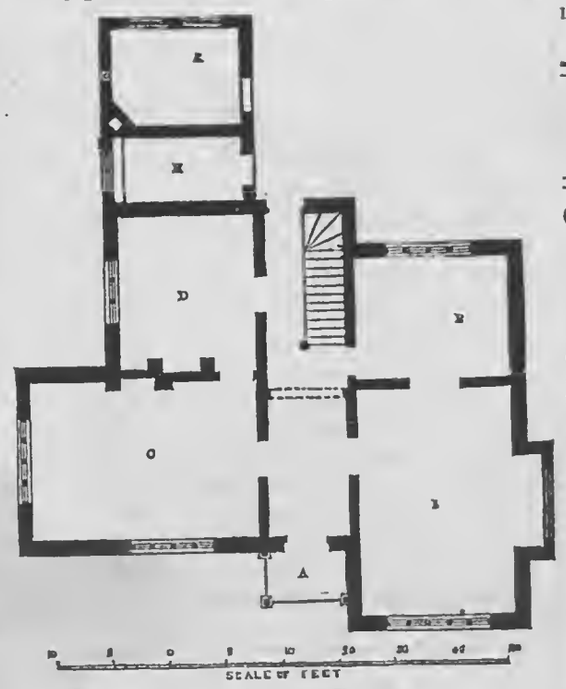

FIG. 2.—GROUND PLAN.

the troughs, thus keeping everything clean. Where the feeding conveniences on the floor are not sufficient, a wide board may be placed at a proper hight above, and a feed box outside, as below.

The three 6x6 feet square parks against the rear of the building, are for the purpose of doing away with the little inadequate "hen coop." The hatching box is placed in one corner, so that during her sitting, the hen may step out occasionally into her neat little park, without being disturbed, shake herself and partake of a little food, and then return to her nest. When the chickens are hatched, the hatching box is taken away. The hen will then have the run of her park, while the chickens can run outside as much as they please, returning occasionally to greet her ladyship, and to retire with her at night into box No. 7. The box should be so placed that the entrance to it might be as much as possible away from storms.

My hennery is above the ground enough to allow of two large boxes being put underneath, upon flat stones, to keep them from the ground. These are filled with gravel and ashes for winter use, thus making provision for cleanliness in the house above. J. SAGAR.

A COUNTRY HOME.—Elevation.

Field Crops.

CULTIVATED FORAGE PLANTS IN KANSAS

L. J. TEMPLIN.

As was to be expected, the vast abundance of nutritious native grasses of the Western prairies furnish such a bountiful supply of both pasturage and hay, that people have been very slow to introduce the cultivated forage plants of the Eastern States. It has been a very prevalent opinion among people here that the cultivated grasses would not succeed in this part of the country. But as the country is occupied and people are compelled to keep their stock on closer range, it is found that the native grasses will not endure very close grazing. When closely grazed, most of these grasses gradually disappear, and are replaced by different species of worthless and troublesome weeds. The introduction of the cultivated grasses is, therefore, gradually becoming a necessity. The most profitable meadow grass yet introduced, so far as I have learned, is common

TIMOTHY (*Phleum pratense.*)

This is considered the most valuable grass for hay in nearly all the Northern and Western States. It grows fairly on a great variety of soils, but succeeds best on moist, rich clay loam. On such soils it often produces from 2½ to 3½ tons per acre, and has been known to produce six tons, or more, at a single cutting. It yields a large percentage of dry hay which, according to Way's analysis, gave a larger percentage of albuminous, fatty and calorifacient matter than any other grass upon which he experimented. According to Wolf and Knap, the hay, when cut in flower, yields the following percentage of ingredients:

Water	14.3	Carbohydrates	48.8
Organic matter	81.2	Crude fiber	28.7
Ash	4.5	Albuminoids	9.7
	100.0	Fat, &c.	3.0
			81.2

According to C. L. Flint, timothy hay contains the following elements, economically considered:

Albuminoids, or flesh-formers	11.36
Fatty matter	3.55
Carbohydrates, or heat-producers	53.35
Woody fiber	26.46
Mineral matter or ash	5.28
Total	100.00

Analysis shows that timothy hay from grass cut in seed is more valuable than that from grass cut in flower, in the proportion of 23 to 10; but, while I do not question the correctness of these chemical analyses, I do seriously question whether the chemistry of a cow's stomach will bear out the results of tests in the chemist's laboratory. In the production of seed, a large part of the nutritive matter—starch, sugar, etc.—is converted into woody fiber. In the process of analysis it is probable that a portion of this is reconverted into carbohydrates, while in the animal's digestion such a change does not take place. At any rate, I think every feeder will find in experience that stock will do better on hay cut in flower, or just as it is going out of that stage, than on that which has matured its seed.

The opinion has been quite general that the prevailing soils of this State are too light and dry for the successful growth of timothy, and this has had its influence in holding men back from engaging in its culture. But the success that has crowned the early efforts to introduce and cultivate it, has proved that it will do well even on these light soils, and under our bright sunshine. The following table shows the acreage, product and value of timothy meadow in Kansas for the years indicated:

	Tons.	Acres.	Val. of crop.
1874	34,067	29,601	$252,817
1875	24,002	21,218	170,466
1876	19,109	16,259	129,093

As the assessment is made on the first day of March, the figures of each year show the product of the year before; 1874 was the great "grasshopper year," which resulted in the destruction of much of the meadow and the discouragement that caused a decline in this product for the next two years. But in 1877 the acreage had bounded back to 25,312 acres, and in 1878 to 40,121. This rapid increase in the amount of this crop shows that the late experiments with this grass have been satisfactory. In addition to this, there was of timothy pasture in 1877—4,202 acres; and in 1878—8,820. This gives an aggregate acreage of timothy for these two years of 29,414 in 1877; and 48,941 in 1878, being an increase of 19,527 acres, or over 66 per cent.

Another important forage crop is

RED CLOVER (*Trifolium pratense.*)

Wherever this crop can be grown, there good farming and the renovation of poor soils are possible. Where clover enters into the list of cultivated crops to a large extent, it is generally found that remunerative crops are produced, and the soil does not suffer serious deterioration. When two crops of hay have been carried from the field, it still leaves more fertilizing matter in the field than is carried away. But it is more as a forage than a fertilizing crop that it is to be regarded in connection with the agriculture of Kansas. The great amount of hay this will produce, and the excellence of the quality, make clover a favorite forage crop without regard to its excellence as a fertilizer. Red clover has produced, under extra favorable conditions, over six tons of dry hay per acre. This, according to experiments made in England, gives nearly one ton of nutritive matter per acre. This, according to Wolf and Knap, contains of water, 16.7; organic matter, 77.1; ash, 6.3. The organic matter is composed of albuminoids, 13.4; carbohydrates, 29.9; crude fiber, 35.8; fat, &c., 3.2. This

represents that cut in full bloom. When left till ripe, it is slightly less nutritious than the above. Economically considered, red clover hay consists of—

Flesh-formers	22.55
Fat-formers	44.00
Accessories	24.00
Mineral matter	9.45
Total	100.00

The value of clover hay depends not only on the time it is cut, but also on the manner in which it is cured. A slow process of curing makes a better quality of hay, while a thorough curing, so that the large stems may be well dried out before it is put in the stack or mow, is of great importance to the future excellence of the hay. The great difficulty in growing clover in this part of the country, is in getting a catch, as every season is not favorable to the germination of the seed and the growth of the plants while very young. The locusts also prove very destructive to the growing clover, eating it down to the crown of the roots and thus killing it. This is seen in the decrease resulting from their visitation in 1874. The report of the acreage of clover meadow on the first of March in that year, shows 13,967 acres, while the report for the next year, 1875, shows but 6,303 acres in this crop, a falling-off of more than half. The severe injury caused by the young brood that hatched out in the eastern part of the State in the spring of '75, in connection with the discouragement resulting from their ravages, resulted in reducing it in 1876 to 4,973 acres. But since that year there has been a steady improvement, 1877 showing an area of 9,797; and '78, 12,429 acres.

The amount of clover pasture for these two years is set down at 1445 acres for '77, and 3770 for '78, making the total area devoted to this crop for the two past years, 11,242 for '77, and 16,199 acres for '78, being an increase of 4957 acres or over 44 per cent.

Another hay crop that is considerably cultivated here is

MILLET AND HUNGARIAN-GRASS.

These are annuals. The advantages of their cultivation are, they may be sown at almost any time during the spring or forepart of the summer, and produce good crops; they flourish on almost all the soils of the State; they produce large crops and, when well saved, they make a very nutritious and palatable hay. The area devoted to this crop the past two years was, for '77, 164,529 and for '78, 144,081 acres, being a decrease of 20,448 acres, probably owing to the extreme wet that prevailed during last June.

OTHER FORAGE PLANTS.

Corn fodder is little used here on account of the dryness of the winters, that makes it impossible to handle it without crumbling it well-nigh to dust. Wheat straw, of which we have millions of tons, is largely used as rough feed by farmers, and is fed with good results.

As a pasture grass, the Kentucky blue-grass, (Poa pratensis), is meeting with considerable favor. It prefers a rather moist, rich, limestone soil, and in a light, porous soil, it is apt to suffer from heat and drought. It is quite difficult to get a "catch" of this grass in our loose soils; but when once established, so far as my observation has gone, it succeeds quite well. There are some other grasses that are being tried to some extent, but those I have named constitute the principal part of our cultivated forage plants. According to the latest reports at hand, the following area was devoted to these crops in the State during the past two years:

	Pasture.		Meadow.	
	'77	'78	'77	'78
Timothy	4,202	8,820	25,212	40,121
Clover	1,445	3,770	9,797	12,429
Millet, etc.	—	—	164,529	144,081
Blue-grass	21,399	27,877	—	—
Prairie (fenced)	553,657	701,421	503,612	667,460

The last item explains the comparative meagerness of all the others.

Where a majority of the people have access to prairies heavily clothed with grass for either pasture or hay, and where hay can be put in the stack for from one to two dollars a ton, and in the barn for twice that sum, it is hardly to be expected that very general attention will be given to the cultivation of the tame grasses. But their adaptability to the soil and climate is being tested, and when the time comes for them to be a general necessity, the people will know just what they can do with them, and experience so far shows that when needed, they can be depended upon.

Reno Co., Kan.

CALIFORNIA REPORT ON FIELD CORN.

THE small farmers in our richer valleys are each year planting more corn. Fields which, under a steady wheat culture were failing, are thus renovated, and the farmers find a more constant employment. In Alameda and Sonoma counties, in the Pajara valley, which lies partly in Monterey county and partly in Santa Cruz county, in the Lompoc valley, Santa Barbara county, and around the city of Los Angelos, the corn crop is very large and appears to be each year increasing. In almost every neighborhood of this State the local demand is good, and corn and hogs have secured many a farmer's prosperity.

Only three kinds of field corn are planted to any great extent—the large white Flint, the small yellow Flint, and the large yellow Dent. For several years past the white has brought the highest price. The yellow Flint is popular among our Portugese farmers, and they plant it almost exclusively. In our rich river bottoms the yellow Dent holds its own, being, on such soils, the most productive. This variety cannot be shelled as soon as husked, and cribs must be provided in which to store it for some months; but we have seen both the white Flint and the yellow Flint shelled in the fillet without injury, the autumn being so dry. Late-planted corn seems to do best, on account of not tasseling out until the early summer heats are over. The rule we used to follow in Alameda county was, "plant in May-day week." Last year corn planted as late as June 20th made a fine crop, and we hear of even later plantings elsewhere. In dry seasons, a common practice is to plant with a spade, thrusting it down and forward, and dropping the corn behind.

Hardly one farmer out of ten thousand makes any pretense of manuring his corn land. In a few cases barn-yard manure is used. There are signs of a revival in this direction. It used to be said that "manure ruined the land here;" that "the climate was so different that it would not assimilate," and various other absurdities. But our progressive farmers now admit the absolute necessity and profit of properly applied fertilizers, of which corn will come in for its share. CHAS. H. SHINN.

Niles, Alameda Co., Cal.

Farm Economy.

MORE ABOUT PEAT MUCK.

GEN. NOBLE is altogether wide of the mark in regard to muck in his remarks on page 166 (March 15). Lest some farmer, guided by those remarks have the experience which I have had, and lose his time by spreading fresh muck on his land, I beg to give a caution and a reason for it

First, muck that is "muck" and is not mixed with a large portion of sand, is nearly all vegetable matter and, as such, is no more fit food for plants than gravel or other mineral matter would be food for an animal. The nitrogen contained in it even, is not fit for use until the muck is decomposed and mineralized and the ammonia formed in the decomposition is set free. The mere fact that the muck is disintegrated and reduced to a fine powder is of no effect further than that it can be spread the more easily. I have been handling muck for years, and know a good deal about it. Of course, there are different kinds of muck, but I refer to that kind which cuts out in solid blocks and consists of a dark, brownish or black fibrous vegetable matter. Now only to-day I have been passing along the banks of ditches which were dug a year ago, and the blocks of muck which were thrown out then are now almost as solid as at first, and for a very good reason. They have dried or have frozen, and when dry or frozen they do not rot; in fact, dry peat is next to imperishable.

To decompose, any vegetable substance must be kept moist and warm, or it must be subjected to a chemical process by a means of some caustic alkali, as lime or ashes. When piled in heaps, vegetable matter will be kept moist and will ferment and become warm and the presence of lime or ashes in the heap will greatly hasten this fermentation and heating. Some years ago I spread hundreds of loads of muck upon a 10-acre field during the winter and lost a whole winter's work of two men and four horses. The muck remained in lumps for years and seemed to resist water and keep as dry as if it were as well protected as a duck's back. It was plowed in and out and torn up and dragged here and there with harrows, and was, in fact, of no use whatever. And such I am sure will be the effect anywhere, of spreading fresh muck upon land in the manner advised by Gen. Noble. So, too, it will be useless to heap it in piles and expect it to be available as a fertilizer within one year, unless a liberal portion of lime or wood ashes is mixed in with it. Further, I would explain that the yellow deposit seen in the ditches in peat swamps is not by any means always iron. When it is, it is generally carbonate or oxide, and useful; and not the sulphate (copperas) and hurtful. The sulphate is very rapidly oxidized, and iron ores or iron rocks are generally impregnated with oxides and not with sulphates, so that, except where alum shales are present, or near-by, copperas in the soil is very rare indeed. But most often the yellow mud consists of infusorial growth, as may be seen by an examination under a microscope of not very high power; and this matter contains considerable amount of nitrogen. A WESTERN FARMER.

BEET SUGAR.

THERE is a very general discussion of late of beet sugar, its manufacture and the advantages thereof. Allow me to ask how far these discussions are based on practical experience and how much has its basis only in speculative theories. It may seem very illiberal, but this is a matter of too great practical importance to be let pass without some comment. If my memory serves me, every attempt in this country to make beet sugar on a large scale has proved a failure. Such, at least, was the result in the extensive works in Illinois a few years ago. The failure was attributed in part, I believe, to inferiority of the beet roots, those grown on prairie soil containing less than the average amount of sugar; but, as there have been failures under other circumstances, I suspect that there must be some inherent difficulty. The loss in the Illinois experiment was, I believe, borne in part by the farmers of the vicinity, who had been led by flattering prospectuses to invest in the enterprise. It may be that the projectors of new experiments have obviated difficulties heretofore encountered. If this be so, they will do well to explain what new grounds they have for expecting success. So far as I have seen, the project seems visionary and the details are scarcely referred to. We have been treated to essays on the great importance of the beet-sugar industry and the success of the French therein; but the fact is ignored that the French Government imposes a heavy—almost prohibitory—duty on foreign sugar, and this alone compels its extensive manufacture at home. In France, also, labor is cheaper than here, and with dear sugar and excessively cheap labor, French success is no criterion for us.

It is nothing to me how much money large capitalists may choose to invest in beet-sugar making, but until we hear of some absolute successes, instead of promises of success, farmers will do well to keep their hands over their pockets. It is not even safe, as some Illinois farmers learned, to make contracts for growing beets, as the experiment may fail before the crop can be sold.

My own belief is that beet sugar, unless with new and expensive apparatus for refining, is inferior to cane sugar; that the best sugar-beets contain a smaller percentage of sweet than cane, and that less valuable, and finally that the cost per pound is such that the product can never be sold here profitably unless our government imposes much higher duties on sugar than at present, or than it is ever likely to do. I shall be very glad to be convinced of error on either of these points.

JOTTINGS AT KIRBY HOMESTEAD.

COL. F. D. CURTIS.

Nuts for Planting.

THE fall of the year is the time to save nuts for planting. They are too dry now to grow. None of ours which had become dry, grew last year. They should be planted in the autumn as soon as ripe, or covered with a mulch on the ground, or put into a box with sand, and left out of doors. Last year was a very poor nut year, and nuts were scarce. These remarks are for inquirers.

Swamps Not Necessary.

It had always been a swamp and stood, the year round, full of water fed by springs in the banks. We saw it thirty years ago, worthless; now it cuts three tons of excellent hay to the acre. An open ditch, all around it, with a good outlet, made it a meadow, and two hay crops paid the cost. You who have worthless swamps, do likewise.

To Make Rich Milk and Manure.

The cream from the milk, when the cows were fed a peck of buckwheat bran, each, was light-colored and thin. Now, when they are fed four quarts of corn meal, the cream is thicker and more yellow. This means more butter. Bran of all sorts is better for young animals, as it makes muscle; but meal is best for cows, as it makes fat, and milk is fat; that is, milk which will make good butter, contains a large per cent of fat. The bran will make the best manure, because there is more of it which goes into the manure pile, and this furnishes a supply of nitrogen. The farmer, then, who feeds plenty of bran, will have a rich manure heap, and so it is cheaper to buy bran and feed it liberally than to stint one's animals and buy commercial fertilizers. Commercial manures do not furnish much nitrogen. This must come largely from grain, and the bran is the nitrogenous part, and without nitrogen there will not be a perfect plant growth. The lesson we would teach, is to save all of the bran for the growing animals, and the meal for the fattening ones and the cows. To make them all healthy and to utilize and assimulate both bran and meal perfectly, roots should always be fed. This is an important part of the system, and helps to make perfect digestion, Good digestion insures health and vigorous appetite. These are the foundations of profit.

Prickley Comfrey.

WE have had an experience on Kirby Homestead with Comfrey of the common sort, for almost a hundred years. We suppose the *Prickley* is the same so far as habits, taste, etc., are concerned, only perhaps more so; and if it is, it is all the worse for it, for the Comfrey without the Prickley is a pest. We never knew an animal to taste of it, and they have often run in the lot where it grows when the feed was very short. The roots are excellent for a tea, or to make into a sirup by steeping them and extracting the mucilage contained in them. This is what it was planted for by an old slave woman at her cabin door. It is an old-fashioned medicinal herb, and that is its only value.

On the other hand, it is a nuisance, for its propensity to spread taxes the patience and skill of any one who has it; for, once rooted, it is almost impossible to get rid of it. Every bit of root or fragment of a root will grow, and the more it is mutilated, the more Comfrey. The old slave woman has been gone almost a century, but the Comfrey "goes marching on," and has reached far out into the field. A more lasting memento could scarcely be.

LUGUBRIOUS EXPERIENCE WITH CHUFAS AND ANGORA GOATS.

MRS. T. L. LAMB, in a late RURAL, seems to murmur much at the manner in which C. H. Spaulding disappointed her in the piano trade; and then goes right on to inquire where she may find "some things in which she may be dealt honestly by." First, she asks where she may procure some of the

Chufas

she saw spoken of in the RURAL of December 28. Permit me to offer the tubers of the chufa gratuitously, if your fair correspondent will employ a *cheap* hand to dig them.

I think it was in 1854 that I procured a package of chufas from the Agricultural Department, Washington, D. C. I was particularly careful to select the best place in my garden and put it in the best possible shape for the *valuable seed*. The seed was put in and carefully "watched and tended" during the summer. In the season of digging I attended to that job myself, and from the half pint planted, I harvested about eight quarts of inferior nuts or roots, which in taste resembled, a very little, a poor almond; but in size and shape they were so nearly like the root of what is here known as Lake grass (which grows from the muck drawn from the shores of our Lake Chautauqua onto our up, or dry, land), that it took an expert to tell them apart. I dug them, as I supposed, clean, getting every one it was possible to find.

The next season I found that hundreds of plants made their appearance where they were grown the year previous. I hoed them, weeded them, pulled them, but they thrived beyond my desires, and the surface covered was nearly double the space sown the year before. I exercised all my wits to eradicate them. I salted; I used the hot suds from the washings; and finally seeded the ground to clover; but it was chufas all over. When I built my house, I covered this spot at least two feet deep, in grading, with earth taken from the cellar, and yet the last season I had about one rod square of chufas. One thing is a certainty—I am a miserably poor eradicator of nuisances, or the chufa is very tenacious of life; and in my opinion a very worthless pest.

Next, our friend desires a pair of fancy pets—in the form of

Angora Goats.

A few years ago, a dear friend of mine sent me a pair of pure-bred Angora goats—the goat "Billy" and mate—the famous goats which produced the fiber from which the celebrated dress was made and worn, all complete, in 13 hours 8 minutes. They were beauties—if one can call such creatures beauties. They were manageable if confined inside a fence six feet high, made of tight boards or sharpened pickets. But let them loose among your shrubs or young trees, and if you do not execrate the very shadow of an Angora goat, you are more philosophical than your humble servant. Leave a gate open, or a bar down, and they will be through before you can say "Jack Robinson," and then you may call "Ca nan! Ca nan!" and run until you are weary, and yet they will remain at liberty.

I had a very fine row of 12 pear trees of about six years' growth in a yard next to the goats, and a friend went into the yard to *admire* the the goats, when Billy, not liking the intrusion, paid his "*kompliments*" in a hearty butt, which sent Mr. Inspector out of the gate and the gate wide open, and, though hobbling on as fast as he could, William barked the entire 12 pear trees before our friend could obtain assistance to cage the "bird." With his horns he would give one scrape and bark, and straightway go for another, serving it in the same way. Two years' experience taught me they

were too expensive pets for a *poor man* like me, so I swaped them with a horse-jockey for a pony to eat hay and oats, and though the pony does nothing by way of paying for his "keeping," it was a profitable barter.

Now all who want chufas and Angora goats may have my interest in them for the perusal of this article. I enjoy (!) honest swindles, but from such preposterous ones as these, deliver *poor me*. W. A. WHITTEMORE.

Arboricultural.

TREE PLANTING.

PROFESSOR C. S. SARGENT.

A GREAT deal has been said of late years on the subject of tree planting and vast numbers of trees have been planted both at the West and in the Atlantic States, especially in New-England. But in New-England, and presumably in other Eastern States, the planting has, with few exceptions, I suspect, been done by wealthy and public-spirited land-owners, who have been glad to demonstrate that it was not only a proper but a perfectly practicable thing to cover worn-out and otherwise unproductive land with plantations of valuable timber trees. Now that we know pretty well what sorts of trees to plant; that planting is neither difficult nor expensive, and that it is, in the long run, about as profitable a way as any man can find to invest a small sum of money, it is time that the habit of planting trees on a smaller or larger scale, according to the means of the planter, should become established among all agricultural classes.

One reason why this habit is not general and is still confined to those large proprietors who plant by the ten or hundred thousand trees, is the difficulty, no doubt, which farmers have heretofore experienced in procuring the right sorts of trees, in small quantities and at reasonable rates. To meet this difficulty, it has been suggested to the Messrs. Douglas & Sons, of Wankegan, Ill., the largest and most successful growers of forest tree seedlings in the United States, that they could greatly facilitate a general planting of trees among all classes of farmers by sending out by mail, for a specified price and in small numbers, the best kinds of timber tree seedlings. They now offer, therefore, by a circular which I have no doubt can be obtained on application to them, dollar packages, post-paid, containing from 50 to 100 of the best kinds of forest trees. Their reason for doing so will be best set forth in their own words. "In order to facilitate tree planting," they say, "among those who have only the time or means to plant each year a few trees, we offer the above packages, post-paid, for $1 each. The postage on 100 trees and the labor of packing them cost nearly 50 cents, so that our direct profits will be very small; but our experience teaches us that once a man begins to plant trees, he is sure to keep on doing so; so that from these small beginnings we hope to build up among farmers all over the country the habit of planting every year a few hundred or thousand trees, and of considering tree planting a part of their regular farm work."

In speaking of the Messrs. Douglas we are naturally led to say something of the Catalpa as a subject for forest planting, as this firm, convinced of its great value, is preparing to raise many million Catalpa seedlings. About a year ago, Mr. E. E. Barney of Dayton, Ohio, having become impressed with the idea of the value of the wood of the Catalpa, published a pamphlet on the subject, in which he collected a great deal of interesting information about this tree, and especially in regard to the durability of its wood. Mr. Barney, encouraged by the success of his pamphlet, has found it necessary to publish a second on the same subject. "Through the notices," he says, "made of the pamphlet on the Catalpa, published in various periodicals, attention has been awakened on this subject to such an extent that I have received letters of inquiry from every State in the Union, amounting in the aggregate to thousands; also from England, South Australia and New Zealand. As a result, if seed can be obtained, enough will be planted the coming spring to produce millions of Catalpa trees."

Mr. Barney is able to show that there are two well marked varieties of the Catalpa tree, if not two distinct species, in the United States; the one Eastern, the other Western. It has been found, as was to be expected from its geographical range, that this Western Catalpa, or as it called at the West, the *Speciosa* or "Early-blooming" (because it has been noticed that it blooms some weeks earlier than the ordinary *Catalpa bignonioides* in the streets of Dayton, where the two are associated) is much the hardier of the the two. We learn from Mr. Barney's pamphlet, that the Catalpa can be planted with perfect safety in strong, rich lands in every part of the United States south of the 42d parallel; but it is not recommended for New England, where the soil is not rich enough, to develop it rapidly except in favored situations, like the Valley of the Connecticut.

The wood of the Catalpa is very light, but close-grained, easily worked, and susceptible of a beatiful polish. It resembles chestnut, but, unlike chestnut, it is easily filled, and does not warp or start in seasoning. For the Cabinet-maker the Catalpa will be found one of the most beautiful of North American woods, and rank with or surpass the black-walnut, wild cherry and butternut. But the best quality of this wood and the one in which it surpasses all other North American woods, is its durability when exposed to contact with the soil. So many examples of its durability when so employed, have been collected by Mr. Barney that there can no longer be any question that it possesses this quality to a remarkable degree. Its durability, together with the fact that the Catalpa grows in good soil with astonishing rapidity, will make it the most valuable tree farmers can plant for fence posts or for hop or vineyard poles, or generally for out-door construction. Catalpa will have no rival for telegraph poles, nor probably for railway ties. Indeed it is for the latter employment that this tree will be most generally planted, especially as it is found to succeed better than almost any other in Southern Nebraska and Kansas, where there is and always will be a very great demand for ties. I hear of very large plantations either started or proposed in these Western States, and thanks to Mr. Barney's disinterested and patriotic efforts, it is probable that this Western Catalpa will receive, during the next few years, more attention at the hands of planters all over the country, than all other forest trees combined. All interested in trees or in rural affairs in general will find much of value to them in this publication, which I will add, for the convenience of those who may desire to see it, Mr. Barney will forward to any address on receipt of two three-cent postage stamps.

But valuable as the Catalpa undoubtedly is, it should not be forgotten in the desire for novelty, that there are other North American trees of an equal or even greater value, which must not be neglected by the planter. Some years ago and after having paid considerable attention to the subject, I came to the conclusion that of all our trees, the White Ash was the most valuable native tree which our farmers could plant; and as yet I have seen no reason to change my opinion. It can be grown over a very large portion of the United States; it is easily raised from seed; grows very rapidly, and has a market value when less than ten years old. No known wood combines such strength with such lightness; and these qualities cause it to be eagerly sought for both at home and abroad, where there is already a rapidly growing demand for American White Ash. It supplies the navies of the world with their oars, and in light carriages and agricultural implements, especially shovels, goes everywhere with the advance-guard of civilization. The consumption of ash is enormous and is fast destroying this tree all over the country, so that he who plants it can be perfectly sure of a market for all that he can raise, and at prices probably much higher than those which prevail at the present time.

A few years ago it was impossible to procure white-ash seedlings for forest planting; but now they are regularly raised in large numbers, and are sold at such low rates as to be within reach of every farmer who may desire to plant this tree. For their own sakes and for the general prosperity of the country, it is earnestly hoped that the number will be large.

Miscellaneous.

WHAT OTHERS SAY.

EXTRACTS FROM PROCEEDINGS OF N. T. S. H. S.

WITHOUT a single exception we find those orchards that have received the most abundant supply of barn-yard manure have yielded the largest crops of the finest fruits. *No exceptions to this rule.* We find also the same orchards yielding more or less, just in proportion to the supply given. . . . We also find that peach growers are learning that the Peach responds liberally to the manure supply, by giving more bushels of superior fruit; and many of our peach growers are using large quantities in connection with good cultivation. . . . It would appear to your committee that the number of those who keep their orchards in grass, or pasture with sheep or hogs, or fertilize their trees with muck or manure or compost, is increasing, as this course seems to keep the trees in vigor and produce good apples abundantly. . . . I never have seen an orchard doing well where it was kept seeded down and the grass cut and carried off for hay, but I think it might be done if sufficient fertilizing material was drawn on to replace the loss by the hay; but the trouble is that those that practice this system do not draw on the manure. . . . I have also a small dwarf pear orchard that has been in grass for over ten years, the grass being cut once a year and allowed to remain as a mulch. It has also had a surface-manuring twice in that time. This orchard grows well and produces good crops of fruit. As a rule, however, I think that orchards kept under cultivation until they are twenty-five years old at least, will be found to do the best. . . . I think that generally apple orchards over twenty years of age have been in the past, and will be in the future, much more profitable than ordinary farm crops; but I wish to impress upon the planter of an orchard that he must look for his profits after, rather than before, that date; there are thousands of orchards that, from various reasons, never prove paying investments. . . . One member of your committee (Mr. Swan) sold the product of less than one-fourth of an acre of Quinces for $100, and with the experience of several years in growing this valuable fruit, he is fully confirmed in the opinion that "growing Quinces for profit" is a reality. . . . Farmers upon the prairies, who have had to contend with winds and storms, which came to them over vast areas not broken by timbered lands, and who have suffered the loss of crops, buildings, stock and valuable lives from this cause, are impressed with the fact that they must have screens and fruit protection before they can be comfortable or safe. Their efforts will, I doubt not, be crowned with success, and we *may see*, before many years, that they surpass us in the possession of valuable timber, as far as they now excel us in the growing of abundant grain crops. They have sharply suffered from hail-storms and hurricanes coming over their treeless regions, and been parched and frozen by winds which should have been moderated by passing through wooded sections, until they are ready for the work and cost necessary to protect themselves and their children.

TREES IN GRASS.—A correspondent of the Gardener's Monthly, living in New Hampshire, furnishes an example of a successful orchard, with trees standing in grass. The land was never plowed, the ground being unusually rocky. The trees, however, have been regularly and liberally manured. The writer seems to have overlooked the fact that it was the manure and not the grass that made the trees grow and bear so well. We have heard of the farmer who found sawdust pudding an excellent feed for his cows; all that was necessary was to add liberally of Indian meal—and, in fact, the larger the proportion of Indian meal, the more satisfactory was the effect of the sawdust. We are reminded of this anecdote by much that is said in favor of grass in young orchards.—Country Gentleman.

BUTTER "COMING."—I have had some difficulty in getting my butter during this very cold weather. Although the cream was warmed up to 60 degrees, as usual, the butter was two hours coming, and crumbly. It occurred to me that possibly the fat globules do not get thoroughly warmed through when the cream is very cold, and warmed only just before churning, so I tried an experiment. I warmed the cream the previous night up to 70 degrees, and left it in the kitchen all night; in the morning the temperature was 50 degrees—I warmed it up again to 60 degrees and churned. This was completely successful. The butter came, as usual, in three-quarters of an hour, nice and firm, but not crumbly. Perhaps this may be useful to your readers, as I often see complaints of difficulty of getting butter in cold weather.—London Agricultural Gazette.

USE OF FERTILIZERS.—The Scientific Farmer says: "We have known farmers to act as if they thought a purchased fertilizer had some secret magic about it which would enable it to "boost" the crop out of a slough, or bring water to the crop from the heavens. We have seen crops put on land which could by no possibility develop a full harvest, in the full expectation that the fertilizer could serve as a Jack-of-all-trades, and would obediently furnish the plant with drainage, with warmth, with food, and with a machine to keep down the weeds. Because the harvest doesn't pay for the fertilizer in these cases, there is blame attached somewhere, but never where it belongs, —on the farmer himself, whose stupidity led him to put his plant in a field where he knew from experience manure could not make up for location, fertility, and season, all at once."

SINCE man has been endowed with power over the lower animals, it is only just on his part that he should exercise that high privilege with due consideration for the subjects which compose his vast dominion.

"It is excellent
To have a giant's strength; but it is tyrannous
To use it like a giant."

It has been asserted that brutes are insensible to suffering, and that it is only refined human beings who have sensitiveness to pain. We hold that this theory is totally unsupported by proof, and maintain, with the great dramatist, that

"The poor worm we tread upon
In corporal sufferance finds a pang as great
As when a giant dies."

FROM Prof. S. W. Johnson's Annual Report of the Connecticut Agricultural Experimental Station for 1878, we make a few extracts:—

SPECIAL MANURES OR FORMULAS FOR PARTICULAR CROPS.—Special Fertilizers appear to have been first prescribed in detail by Prof. J. F. W. Johnston of Scotland. . . . The "worn out soils of New England" are various in their crop-producing qualities. Many of them are able to supply potash in excess of all ordinary demands. Many of them require lime and sulphuric acid in order to feed crops, and most of them fail to yield rather on account of mechanical or physical deficiencies, or defect of water supply, than because they are exhausted of the nutritive elements of crops. With this diversity of soil it is vain to expect that we can rationally or successfully adapt special manures to our various crops. Even if our soils had been all originally alike in texture and composition, the different treatment they have undergone in what we politely term "cultivation," has been such as to draw upon their natural resources very unequally, and make it needful to adapt the manure to the soil as well as to the crop. . . . In British agriculture it was found some thirty years ago, in many localities, that soluble phosphoric acid was fairly a specific for the turnip crop, and that nitrogen acted with especial energy on wheat. . . . In the world-famed field experiments of Mr. Lawes, nitrogen alone has wonderfully kept up the wheat crop for many years, while it failed totally to make turnips after three seasons; and soluble phosphates alone gave a large yield of turnips for a succession of crops; but had little effect on wheat. Many farmers on land similar to that of Mr. Lawes obtained like results . . . In honest truth there is no possibility of compounding special fertilizers adapted to each of our various crops, or even to our various classes of crops. There are no principles of science as yet discovered or conceivable, nor are there any results of practical experience attained, or presumably attainable, which can lead to such a result. On the contrary, experience

and science most fully agree as to the vanity and folly of such attempts. Special Manures for particular crops are, in fact, least heard of where agriculture is guided by the clearest light of science and the widest range of experience.

BIENNIAL REPORT of the State Agricultural College, Manhattan, Kansas. In this report Professor Gale says: "The tree planters of the East are looking to us for results; and it will be wise in all our plans for the future to remember that we are located almost in the middle of the great central region where forest-culture, upon as grand a scale as the world has ever known, must some time be accepted as a necessity. In recognition of this fact, Prof. Sargent, of the Harvard Botanical Gardens, has forwarded to us about one hundred species of trees and shrubs. These have been planted out and the results will be carefully noted. We should accept it as a fact, that experiments undertaken here in forestry and fruit-culture will interest a large number of people, and facts deduced at this point will benefit a larger region of country than probably has ever been instructed by the experience of any other section."

Among the farm experiments conducted by Professor E. M. Shelton is the following, which goes to show that the removal of suckers from corn is a losing operation:

"In this experiment eight strips or belts were staked off through the center of that part of a field devoted to corn the past season. Each belt occupied 1-20 of an acre; every alternate strip had the suckers carefully removed on June 10th and July 2d, the plants in the remaining strips being allowed to grow according to their natural inclinations. The result of this experiment is shown in table No. 3.

TABLE NO. 3.

Plats.	Yield of plats in lbs.	Yield per acre in bush. of 70 lbs., ears.
Plat A—natural	181	51.7
Plat B—suckered	169	48.2
Plat C—natural	170	48.5
Plat D—suckered	160	45.7
Plat E—natural	159	45.4
Plat F—suckered	154	44.0
Plat G—natural	182	52.0
Plat H—suckered	159	45.0

In table No. 4 the yield of the suckered and natural plant belts are grouped for comparison.

TABLE NO. 4.

	Aver. yield of plats, lbs.	Aver. yield per acre in bushels of 70 lbs.
Natural	173	49 4-10
Suckered	160½	45 9-10
Increased yield of natural plats	12½	3 5-10

The ground upon which this experiment was conducted was selected because of the uniformity of its soil. The result seems to show, however, that the soil became progressively poorer from plat A to plat H. A glance at these tables will show that the removal of these suckers was a positive injury to the crop, and that, not in occasional cases, but uniformly through the series, there being only one exception to the rule of the experiment, that the 'natural' plats yielded larger than either of the suckered plats adjoining. It would seem from this that the practice of removing the suckers from the growing corn is not well founded."

PROCEEDINGS of the Twenty-fourth Annual Meeting of the Western N. Y. Horticultural Society; P. C. Reynolds, Sec'y., Rochester. We shall have several occasions to refer to this again.

Fertilizer Analysis.

243. Refuse from paper manufactory.

From R. E. Pinney, Suffield. A wet, pasty mass.

Water	39.5
Sand	1.5
Caustic Lime	2.5
Carbonate of Lime	46.6
Carbonate of soda	6.1
Sulphuric Acid, Magnesia, Alumina and oxide of iron	3.8
	100.0

None of the ingredients of this refuse give it any value as a direct source of plant-food, except lime. Its uses for agricultural purposes are those to which lime is commonly applied. The carbonate of soda acts like lime, but more rapidly, and requires caution in its use. This refuse may be serviceable as a top-dressing on grass or to compost with swamp muck. Strikingly good effects rarely appear from lime until the second year. The commercial value of this material, as a fertilizer, is that of the equivalent amount of the cheapest lime.

244. Animal scrap manure.

Horticultural.

CELERY (Apium graveolens).

THE RURAL has repeatedly urged those of its readers that own gardens, to cultivate a full line of vegetables, and not merely a few cabbages, beets and turnips, as is too often the case. The plant that forms our present subject, should never be looked for in vain in any vegetable garden. Its cultivation is easy, and it is decidedly a relishable addition to the table during the whole winter season.

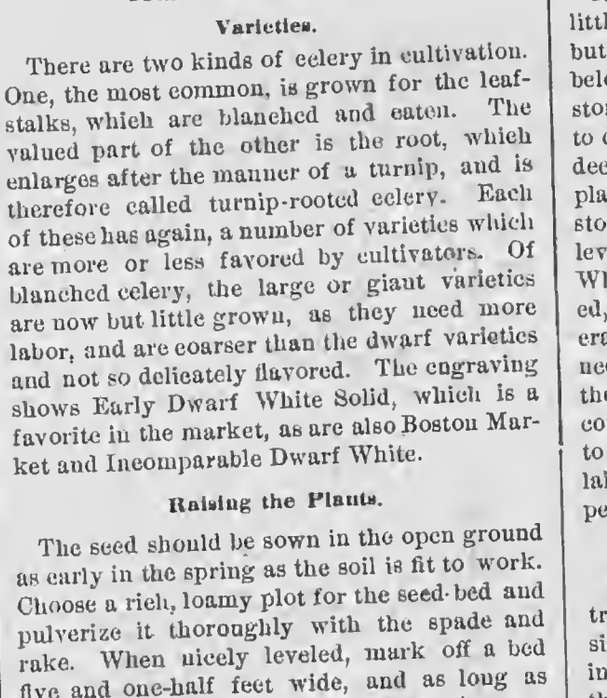
TURNIP-ROOTED CELERY.

Varieties.

There are two kinds of celery in cultivation. One, the most common, is grown for the leaf-stalks, which are blanched and eaten. The valued part of the other is the root, which enlarges after the manner of a turnip, and is therefore called turnip-rooted celery. Each of these has again, a number of varieties which are more or less favored by cultivators. Of blanched celery, the large or giant varieties are now but little grown, as they need more labor, and are coarser than the dwarf varieties and not so delicately flavored. The engraving shows Early Dwarf White Solid, which is a favorite in the market, as are also Boston Market and Incomparable Dwarf White.

Raising the Plants.

The seed should be sown in the open ground as early in the spring as the soil is fit to work. Choose a rich, loamy plot for the seed-bed and pulverize it thoroughly with the spade and rake. When nicely leveled, mark off a bed five and one-half feet wide, and as long as needed, on which sow, rather thinly, six rows of seed nine inches apart. On a bed 10 feet long, may readily be raised 800 to 1,000 strong plants. The seeds are very small and somewhat slow to germinate and should therefore scarcely have any covering. It usually affords sufficient covering to pat the bed down with the back of a hoe or a shovel, after sowing. If the weather is dry, the bed must be kept moist by watering. As soon as the plants put in an appearance, the bed should receive a light hoeing, which should be repeated as often as necessary. To produce strong, stocky plants, it is well to shear off the top to within an inch of the ground, once or twice before planting.



EARLY DWARF WHITE SOLID.

Planting and Blanching.

Market gardeners generally grow celery as a second crop; that is, on land on which have been raised early cabbage, peas, onions, etc. These crops will be cleared off about the middle of July, at which time the celery should be planted. Celery delights in a rich soil, but if the land was liberally manured for the early crops, it will not be necessary to manure it again now. Plow or spade the land deeply, and dress it evenly with a rake. The plants are then set in rows three feet apart, and six to eight inches apart in the row. Plant them like cabbage, with a dibber or pointed stick, and pack the soil closely about them. Planting firmly is of importance during warm weather, and, indeed, in all out-door planting, as it prevents the plants from drying out so rapidly. If the weather is dry, and only a few hundred plants are set out, it will pay to give them a good watering. This will settle the soil about them and keep them moist for a couple of days until new fibers are formed.

After planting, there is nothing further to be done for about seven weeks than to keep the plot clean and to water if necessary; but at the end of that time, which will be in the first half of September, the plants should receive the first banking up. This must be done carefully. The plants are spreading out considerably, some of the leaves resting on the ground. These must be gathered up in a bunch, and the soil drawn up about them with the hands, so that they remain upright. But little soil should be heaped about them the first time; a little later, the celery which is to be used early in the fall, should receive the full banking up, which must be done with a spade, but what is to be stored away for winter, should not be banked until the first of October. Of course the fit time for this operation will vary with the locality; where hard frost sets in about the latter part October, the plants must be banked up earlier. The old way of planting the celery in a trench, to facilitate the blanching, has gone out of date since the dwarf varieties have become popular. If the larger varieties are grown, they must either be planted five feet apart, to give room to bank them up, or they should be planted in a trench about eighteen inches deep.

Storing.

It must be understood that celery will bear a little frost—about 10°—without any injury, but when the thermometer is disposed to sink below this, the crop must be taken up and stored for winter. The best way to keep it is to dig a trench not over 18 inches wide and as deep as the celery is high. In this pack the plants closely, in an upright position as they stood in the ground, so that the tops will be level with the surface of the surrounding earth. When wet or frozen, they should not be touched, as handling them in that condition accelerates their decay. Here they remain till needed, when they are taken up as used. As the cold weather increases, they should be covered with leaves or straw sufficiently thick to exclude the frost, and on top of this may be laid boards which will prevent the rain from percolating through to the plants.

Turnip-Rooted Celery.

This variety is but little known in this country, but in Europe it is grown far more extensively and is considered of much more value in the kitchen than the blanched celery. Like the latter, the seed is sown in early spring, and the plants are set out in the latter part of June. The land should be rich and deeply pulverized, and as they require no banking up, the rows may be one and a half foot apart, with one foot between the plants. Use the hoe vigorously between the rows during the summer, and in the full, when the other celery is taken up, this also should be lifted, the earth shaken off, the roots shortened and the outer leaves cut off, when it will appear as in the engraving, ready for wintering or for market. It may be stored in trenches, like blanched celery; but it is more convenient to set it in moist sand, laid about six inches thick, in a cool but frost-proof cellar. Here the plants are packed closely together, with the tops upward, as when growing in the garden; thus they are handy at any time. The roots are cooked in a score of ways, and for soups they are certainly far superior to any turnip ever raised.

Everywhere.

RURAL SPECIAL REPORTS.

MISSOURI, Oregon, Holt Co., March 24.—Just 19 years ago the weather started to acting exactly as it has been doing for two months; that is, every time the signs of rain became undoubted, around whirls the wind to the northwest, and farewell all hopes of rain. During 1859 we had no rain from about Feb. 1st until October. Literally, nothing was produced off the lands save from those within eight or ten miles of the Missouri River. These lands yield unfailingly if properly cultivated. We had hoped, and hope yet, that our climate, where abundant rains during the past six or eight years have given us great crops, has been changed permanently by the breaking of the heavy matted sod over immense areas, and by the planting of great forests. But how, if not? I have repeatedly said that if the climate is not so changed, our comparatively regular seasons of the past ten years will prove to be a terrible misfortune. For, if we shall have such a season as that of 1859 while there are at least six hundred thousand people living where then not over thirty thousand resided on soil where nothing grew and the very cattle perished, what can be done? To relieve those 30 thousand was a big job then, and those who saw some of them coming over the river from the Arkansas and Kaw valleys, never can forget the sight. We are a most reckless, unwise people. During the past four years we have had crops unequaled, and have by legislation compelled low prices, and *therefore* immense exports. Soon we shall have inflation and high prices. But not a thing is laid by for the years of famine. Moreover, we have crowded our population into regions having climates different from the favored portions from the Atlantic to Missouri—regions subjected to such seasons of drought and visitations from locusts, as must leave the people literally nothing to eat. And still, the mighty tide of emigration pours westward. If the climate has not been changed, (or indeed, if we shall have a locust visitation), some day we shall see millions of people occupying a vast region suddenly made as unsupporting as Central Sahara. Would it not be wise, in view of such an event, to make some preparation for the year of famine that seems inevitable? One thing is certain; if this drought of two months lasts several more, we are going to have an experience we are not likely to forget. HOLT.

MARYLAND, Brighton, March 28.—Within the memory of some of our youngest farmers, the dairy has become a branch of the mixed husbandry always followed by men in our section, and owing to our nearness to Washington, it is now the leading interest, returning more profit to the farmer than any other branch. This interest has been fostered by the introduction of the Jersey cattle, and since there has been a general infusion of Jersey blood into the herds in our section, the butter product has risen from about 150 pounds per cow to from 200 to 300 pounds. Until within the last two years, most of our best brands have been delivered to customers, realizing fifty cents per pound the year round; but the last summer we were not able to maintain this price, many retailing at 40c.; while the bulk sold for 30c. or less.

It is in times like these that the thoughtful man will so change his system as to have the largest quantity for sale when there is the most demand—say from October to May. With farm produce at present prices (hay, $10 per ton; bran, $15 or less and corn 50c. per bushel), and fresh cows to commence the winter, a man can make a moderate profit at even 40c. (wholesale), and brands that are well known have never in the last ten years commanded less. This system, besides furnishing a much larger amount of rich manure than would be made by only running a summer dairy, leaves the farmer more time to attend to his harvest, as at that time his cows will require the least attention.

I throw out these few ideas as being the result of experience here, and doubtless they would apply elsewhere, and thus relieve our markets of the glut that occurs through June and July, when more butter is forced on the market than can possibly be used and at a time when most of the wealthy citizens are seeking a cooler resort. G. L. S.

RURAL GROUNDS, Bergen Co., N. J., April 4.—The ground froze three inches in depth last night and is not thawing much to-day. Up to this time we have been transplanting evergreens from one place to another. One of these was a Scotch Pine ten feet high and twenty-five feet in circumference at the base. To-day we received, for this season, our first invoice of Pears. Awaiting a change in the weather, they were covered with sand as received, a foot in depth, where they will remain unharmed for several days if necessary. The season is extremely backward, which especially in this happy valley, we have as a good promise of fruit in abundance. But we find that many of our strawberry plants have suffered by blight, which only began to show itself late last fall; that many of our raspberry canes are killed to the ground so that, in so far as those fruits are concerned, we are prepared for a light crop in spite of a late spring. Hyacinths and Tulips are up two inches, and there they remain as if bewildered what to do next. Crocuses bloom here and there. Spring work in the ground is at a standstill, and Randall (our foreman), having discharged his extra help, has put on a long face and returned to those never finished winter employments, of cutting wood, making labels and whitewashing the hen-houses. But the sun will shine to-morrow and then we shall have two days of work to do for every day that is lost now. Late springs have their advantages and their disadvantages.

NEBRASKA, Keene, Kearney Co.—Here in the West are thousands of acres of wild buckwheat which causes a loss of many thousands of dollars to the farmers in short crops and extra

labor. I should like to tell those who are suffering from that plant how easily and profitably they can get rid of it once and forever—if afterwards they will be careful to sow clean seed. Ground that has been seeded down to wild buckwheat should be well cultivated with a cultivator, then harrowed any time in April. On no account should the ground be plowed either in spring or fall, as it turns some of the seed under to such a depth that it will not sprout. After harrowing, the ground should be left till about the first of June, when the buckwheat will commence to blossom. It should be immediately plowed and *well* turned under, then harrowed. Next, sow on it from 16 to 18 quarts of either millet or Hungarian. Harrow it well and then roll the ground. If this plan be followed to the letter, there will be a splendid crop of grass. It should be cut when it is in the blossom, as it then makes finer hay. The reason why Hungarian or millet should be sown is this: it makes a very rapid growth and smothers any seed buckwheat that may have been turned up to the surface in the last plowing, and after the crop is cut the frost kills the buckwheat before it can mature its seed. S. S. B.

VERMONT, Williamsville, Windham Co., March 31st, 1879.—The winter here has been a long but not a cold one. Owing to a severe freshet, the business of road building has been and is in a most flonrishing condition. Our heaviest storms have come this month, and snow now is three feet deep on a level. March 27th gave us 12 inches of snow; it was very moist, clinging to the branches until all kinds of tree resembled the Weeping Willow—in shape. Sugaring comes on late, and but part of the tapping has been done. The quality of the sugar thus far made, is good; sells at 12c. to 14c. Produce is low: butter brings 18c, to 20c. per pound; eggs, 12c. a doz; potatoes, 75c. a bushel; oats, 45c. and Northern corn 75c. Wheat is hardly quotable here, as but little is raised—average yield 20 bushel to the acre. Western meal is $1.10 and wheat bran $1.05 per hundred. Hay $10 a ton and plenty of it. Dressed pork is 5c. and dressed beef 6c. per pound. A narrow-gauge railroad is now being built to run through the center of the town. It is to be completed Oct. 1st 1879. Until that is finished we are 12 miles from a railroad. S. M.

ALABAMA, Newmarket, Madison Co., March 29.—The prospects for wheat, fruit and the grasses are very flattering in this country. We had for this region a very cold and unusually long winter. Much corn has been planted, and some of it is up and worked over. Preparations are being made for a large cotton crop. Clover, timothy, orchard grasses are luxuriant—half leg-high. Asparagus, lettuce, radish and onions are plentiful; peas are nearly on hand. Provisions low; butter, 10c.; eggs, 5c.; beef 5c.; pork, 3c.; lard, 6½c.; bacon, 6½c.; corn, from 40 to 60c.; oats, 30c.; wheat, 90c. The practice of potting Strawberries is becoming general. I have adopted a new plan which succeeds admirably and costs nothing. In all our towns large numbers of oyster-cans are thrown away. They make excellent pots. Put them in the fire and unsolder them. You now have a cylinder which only needs a small string to keep it in shape, and it is easily pushed into the soil near a plant, and as easily removed. By merely making a hole, inserting the can, removing the string, you have all the advantages of pots. Indeed such a device is much better than an ordinary pot, as there is no bottom, and the plants suffer less from drought. Such contrivances will also answer for melon, cucumber, egg plant and tomato seeds. N.

COLORADO, Fort Collins, Larimer Co., March 31.—I have already put in fourteen varieties of spring wheat and shall sow some more next week. I shall test the corn question in Colorado; but expect a failure on account of the cool nights. Over 1,000 people are arriving in this State weekly. A train of 300 from the East has just passed down to Denver and Leadville. Prospectors are filling the mountains by hundreds all along this line. Our college will open in September. We are expecting a large and extensive patronage from the East. Our place is already filled with Eastern people and some invalids, some of whom have children they will put into our institution. We shall make our college equal to any, in a *practical* point of view. So fast as our means allow, we shall adopt not only agriculture in all its bearings, but every department of science, mechanics, telegraphy, etc., etc. A. E. B.

VERMONT, Randolph, March 27.—The snow is very deep, and but a very few warm days have as yet beamed upon us. Sugaring is two weeks later than last year, certainly. It has been a good winter for business, as there has been sledding all the time. Many farmers have hauled their manure into the fields since getting up their wood. Market prices for produce of all kinds are very low. Corn, 60c. per bushel; oats, 1c. per pound; potatoes, 65c. per bush.; butter, from 15 to 18c. per pound; pork and beef are doing a little better; veal calves are only $4 per hundred, live weight; seed wheat of the Lost Nation variety is still at $2 per bush.; Golden Sheaf at $1.75. Wood, lumber, shingles, etc., are very cheap. Hired help is abundant and wages very low, from $8 to $15 per month for good help. Resumption of specie payments has not effected much change as yet. R.

NEW YORK, Charlton, Saratoga Co., April 1.—Last year plowing began about the middle of March. Potatoes were planted and oats sown in March; now the snow is seven feet deep between the house and barn and people travel with sleighs. North and south, roads are full of snow. Winter grain is all covered up and has been all winter; can't tell how it looks. Robins came the middle of March, and since then we have had two severe snow storms, snow six inches deep; am afraid the birds are dead. To-day the wind is cold and freezing, from the west. The crows held a council the other day, hundreds being present. We never knew so many to winter here before. Farmers are worried to know what potatoes to plant. Peach-blows do not yield well, and Early Rose are also running out. F. D. C.

OHIO, Cardington, Morrow Co., March 28.—The winter has been admirable for our wheat. I do not think it has been injured in the least. Still for success we shall require a favorable season from this time on. Provisions of all kinds are cheap; hay, $5; wheat, 95c.; corn, 30c.; oats, 22c.; potatoes, 75c.; butter, 12c. per pound; good stock cattle, 3 to 3½c. per pound; hogs, $3.30 per hundred; sheep, $3.75 to $4.25 per hundred; horses from $75 to $225. Stock of all kinds look well. Money seems a little easier and business men seem hopeful for the coming season. Indeed, the outlook is encouraging. Economy and perseverance will soon bring about better times. J. G. G.

CALIFORNIA, Carpenteria, Santa Barbara Co., March 25.—Grass and grain are looking well—more than knee-high and thick on the ground. Fruit trees never looked so fine. Apricots and Peaches are in bloom. Pears and Apples begin to blossom. Early potatoes look well. Farmers have their land nearly ready for planting corn and beans. Corn is worth from $10 to $12 per ton at the crib; beans, 1¼c. to four cents per pound; barley, ¾c, per pound; potatoes, one to two cents per pound; pork and beef, four to five cents; hay, $5 to $8 per ton. O. N. C.

KANSAS, Scapo, Republican Co., March 29.—I immigrated to this State five years ago, but have been farming on my own account only four years last November. I have raised as high as 80 bushels of corn per acre without any manure whatever. The corn in most parts of this country is badly "mixed." I've devoted much time and care to the selection of seed-corn, but have not yet been successful in making it a pure seed. I am certain, however, that we have a good corn country. G. W. C.

NEW YORK, Whitney's Point, March 29, '79.—Weather moderating. Snow disappearing fast. Roads impassible; neither wagoning nor sleighing. The drifts are softening so that it is nearly impossible to get through them. Wages, by the month, $13@15; maple sugar, 14c. per pound; potatoes, 60c. per bushel. The depth of snow that has fallen during the last winter is about six feet. Stock looks well hereabouts. Dry in spite of the long, steady winter. M. B. D.

NORTH CAROLINA, Ashville, March 29.—The tobacco crop has been quite a success in western North Carolina this season. The crop has passed off at exorbitant prices. In fact nothing like it has ever been known in any sections of the South. It was nothing uncommon for a farmer to make $300 per acre, without manure.

As predicted by me ten years ago, this is destined to be the finest section in the world for yellow wrappers. Thousands of acres of original forest stand among these mountains, which only wait to be cleared to yield a rich return. Nothing but virgin soil will grow the fancy wrapper to its perfection. S. C. S.

AMHERST, Mass., March 29.—We have had but little extremely cold weather during the past winter, the coldest time being 6 deg. below zero. About half of the peach buds are killed. There is about six inches of snow still on the ground, which is slowly going off. But little frost in the ground, even in open fields. L. W. G.

VERMONT, Newport, April 3.—We are buried in snow here more than at any time during the winter. But our seasons change so abruptly that next week we may be making garden. Last year at this time we were plowing T. H. H.

OHIO, Hillsboro, March 31.—Weather changeable; mud roads impassible; wheat looking well where properly fertilized. Corn, 30c; oats, 25c; wheat, 95c; potatoes, 40c to 80c; J. B.

Industrial Implements.

SCREW STUMP-PULLERS.

IT is hardly necessary to enumerate the advantages to be gained by clearing the land of stumps. They are unsightly, a constant annoyance when there is plowing to be done, and render the land unproductive and unprofitable in proportion to their numbers. To remove them partially by burning, and then counting upon time and decay to do the rest of the work is poor economy, hence a multitude of mechanical devices have been employed to accomplish the work at a saving of time, labor and expense. One of the most successful machines is the stump-puller illustrated in this

THE WATERTOWN ENGINE.

without any great leverage or strain, irresistibly lifts the most stubborn roots out of the ground. The motion is so steady and progressive that although the operation would seem a slow one, the work is accomplished with celerity. From an economical point of view,—and who does not look in that direction now—the

Chamberlin Stump-puller is a good improvement to buy, as the irons and screw are shipped independently of the woodwork, with simple directions that are sufficient to direct the most inexperienced how to supply and fit the former. A saving in first cost and freight is thereby realized, that makes it an object for any one plagued with unsightly, heavy obstructions, to think attentively of the cost and profit of their taking off. Pamphlets and other pertinent matter are sent out by the manufacturers on application.

THE WATERTOWN ENGINE.

THE first manufactory of portable and mounted steam engines established in the country, was that founded thirty years ago by Hoard & Bradford, to whom the Watertown Steam Engine Co. are successors.

This engine received the Medal of the New York State Agricultural Society in 1850, and a few years later Messrs. Hoard & Bradford appeared upon the State Fair Grounds at Rochester, N. Y., with the first traction farm engine ever built in this country.

The reputation of the firm has been amply sustained by their successors, and we give this week an illustration of the latest improvement, a new mounted engine that combines many superior advantages. The engine has a strong bed, that relieves the boiler of strain from the working of the engine, permitting it to be removed from the boiler and placed on a separate foundation if desired. The frame, cylinder head, guides, and boxes for main shaft, are cast in one piece, avoiding strain, and rendering it impossible for these parts to work out of line. The dome of the boiler contains the heater, the base of the cylinder being joined to the dome. The heat of the boiler is thus imparted to the cylinder. The steam passages are reduced to a minimum, the condensation of steam in the cylinder is effectually checked, and the greatest possible economy of steam is secured. Another distinct feature is the placing of the engine frame in a direct line, the connecting rod taking hold of a double crank shaft with driving pulleys on each end, thus doing away with all side strain. Particular attention has been given to the improvement of the "governor." By the simplest device, and without the intervention of cams or levers, weights, a perfect stop motion, has been added, which on the breaking or slipping of the belt, will at once shut off steam and stop the engine without jar or strain. This is an improvement over all previous devices. In work of differing amount and for different purposes, with varying power, it is often necessary to change the speed of the engine to suit the nature of the work or the amount of power required. To meet this there has been added to the governor a spring balance, operated by a hand wheel, instantly changing and adjusting the speed to any rate required, and that without stopping the engine. This improvement is found on no other engine, we believe.

The "pop" safety valve with which this engine is equipped should be found on every farm engine, as it is conducive to safety and beyond the reach of tampering by inquisitive ignorance.

The company also make a dairy engine that has all the important features of the farm engine, but is built with a view to fitness for its purpose. The boiler is of the return flue pattern, has ample steam and water room and no crown sheet, to expose to danger of explosion by low water. In short, it is just adapted to the purposes for which it is intended.

Anyone about making a purchase, and who finds himself in that state of indecision that is the outcome of a lack of definite information, will find it to his advantage to "post up," and it will be a stamp used to good advantage to get the circular of the Watertown Steam Engine Company.

The Querist.

ANSWERS TO CORRESPONDENTS.

Treatment of Stock.

"*Farmer*," *Oaks, Pa.*, has a mare with foal; every few days she seems to have great pains in her stomach and pelvis, rubs against the stall, and wants to roll very badly: but the fit passes off in a few hours, and he asks for a preventive and remedy. 2. Another mare dropped her colt all right; but immediately afterwards was taken with severe pains and died within four hours; the colt lives and is doing well—what ailed its dam? 3. A cow of his in good condition refused to eat, or ate very little, and in two weeks was so weak that she could hardly stand; an examination of her mouth showed nothing wrong—what treatment should she receive?

ANS.—1. The mare was undoubtedly affected with spasmodic colic caused by indigestion or a cold. Hot applications should be made to the outside—rubbing with hot water, or hot bricks held against the stomach and on the loins. Injections of warm water are good and doses, every half hour until relieved, of sulphuric ether and laudanum—one ounce of each in a pint of water. Follow this treatment with six ounces of solution of aloes—one drachm of aloes to each ounce. A quart of strong ginger tea will relieve mild cases, and should be given if the other medicine is not at hand. A horse subject to such attacks should, every three days, to strengthen the action of the stomach, be fed powdered gentian ½ ounce, powdered ginger 1½ drachms, carbonate of soda 1 drachm. 2. More data are needed to come to a clear conclusion on this point. 3. Give the above daily in a warm bran mash to a cow with poor appetite, and if the animal does not improve, give an active physic followed with the above. For physic, one pint of raw linseed oil every twelve hours until there is an operation. Feed bran and roots freely, with a little salt.

Grinding Long Forage, Etc.

J. W. M., Citronelle, Ala., asks: where can a machine, able to grind long forage, hay, corn-stalks, etc., into meal, be purchased; 2, the address of the manufacturer of the automatic gate.

ANS.—1. A practical machine for grinding long forage into meal has not yet been invented. There are some difficulties in the way, chiefly mechanical, because hay and corn-stalks are fibrous, and not starchy and granular, like grains; and cannot be reduced to meal or even chaff, by grinding, without the exertion of so much power as to cost more than the product would be worth. The nearest approach to any such mill we know of is the Big Giant mill of Field & Co., St. Louis, which grinds corn in the husk, tearing the husk into fragments. Cut corn stalks may be chopped in this mill, but not long ones. 2. There is no really automatic gate that has been successful in use; the nearest approach is gates that are opened by levers or cords pulled by the person in the carriage. A really automatic gate would be useless, because it would open for a cow or a pig, as well as for a horse in a carriage.

Relative Value of Farm Products.

S. A. C., Havana, N. Y., asks, 1, for some idea as to the comparative values of 10 acres of clover and the same number under wheat; 2, which are the most profitable products—cows and butter, or sheep, lambs, mutton and wool; or wheat; 3, how many sheep can be kept on pasture for one cow.

ANS.—1. Ten acres of good clover are worth more than so much wheat, if the value of what is left in the ground by the clover is taken into account. When a crop of wheat is taken, the ground is exhausted of so much of its fertility as is carried off in the wheat; but when a crop of clover is taken, the soil is actually in better condition than before, and is good enough to yield a crop of wheat or corn. 2. Sheep, lambs and wool are more profitable products than cows and butter or wheat. There is less profit in wheat than in any other crop; it costs more in proportion; but, for the cost and labor involved, a flock of sheep produce more value than any other farm stock or crop. 3. Five sheep can be kept where one cow can be pastured.

Lime on Sulphur-impregnated Soils, etc.

J. W. L., Smith's Grove, Ky., asks, 1, where he can get a pocket memorandum-book, suitable for a farmer; 2, his soil has a good deal of sulphur in its clay, and he wants to learn how to apply lime to it so as to get that and the sulphur to combine in the soil.

ANS.—A very useful memorandum-book for a farmer is one of the common diaries which contain a page or half a page for each day; together with monthly cash accounts at the end. Each day's business can then be noted and memoranda made ahead for the particular day for which they are needed. It can be purchased at any good book-store. 2. The sulphur in the clay is doubtless in combination with alumina or iron as sulphate of alumina, or iron pyrites, which are frequent in shale soil. As these gradually decompose the sulphur becomes oxidized and forms sulphuric acid. Lime applied to the soil is then useful to neutralize the acid, and will do this if used in a caustic state; that is, dry-slaked after coming fresh from the kiln; 40 bushels per acre might be used.

Mardi-Gras, Etc.

T. J. E., Luling, Texas, asks 1, the origin of *Mardi gras*; 2, is the Great American Tea Company of this city a reliable firm; 3, are the teas it offers at so low a price, good; 4, how far apart should two fields of corn be planted to prevent "mixing."

ANS.—1. *Mardi-gras*—fat Tuesday—was introduced into this country—mainly into Louisiana and Florida—by the old Spanish and French colonists. It is a form of the Carnival—farewell-to-flesh-meat—during which the inhabitants of southern Europe indulge in wild merriment just before Ash Wednesday, by way of compensation for the six weeks of Lenten mortifications which the Catholic Church imposes on her adherents as a preparation for Easter. Shrove or Pancake Tuesday is the English equivalent. The former name owed its origin to the old Catholic canon law, which ordained that all Catholics should on that day shrive themselves, or, in other words, go to confession. The name Pancake-Tuesday needs no explanation. 2. It has the reputation of fair dealing. 3. They are reported to be as good as can be reasonably expected for the figure. 4. Corn *may* "mix" if planted miles apart; that is, the wind may carry the pollen from one variety to another if miles intervene. In ordinary farming several fields apart will prevent mixing to any serious extent. It is well to select fields out of the line of, or at right-angles to, the prevailing winds.

Detecting Oleomargarine.

G. W. S., Davenport, Iowa, asks if there is any way to tell manufactured butter from tallow without having it analyzed.

ANS.—To tell oleomargarine from *tallow* is not difficult, since it is colored and put up to resemble *butter*. But if our friend means to write "butter" in place of "tallow," we should say that three senses, sight, smell and taste, will each reveal clear differences between the best oleomargarine imitation and genuine butter. The suet taste and smell are never entirely absent, and the "grain" shown on breaking open a print of oleomargarine is quite different from that of butter. In short, oleomargarine, however carefully manufactured, is distinguishable from butter by the absence of every sensible quality that characterizes a good article except color, which is sometimes very closely imitated. No one at all accustomed to handling butter could ever be deceived into taking oleomargarine for anything else but an imitation, and that only to the eye.

Starting a Quince Orchard, etc.

W. B., Susquehanna, Pa., asks, 1, the best method of starting a quince orchard; where seed or cuttings can be obtained; 2, how to clean onion seed.

ANS.—You can purchase one-year old plants of any of our nurserymen for $10 per hundred or thereabouts. This would be the best method unless you prefer to raise your own plants. Cuttings may be taken in the fall or spring, a foot long, or eight inches would answer. Plant them in a compact soil, leaving a bud or so, above ground and pressing the earth firmly about them. By the subsequent fall or spring, many of these will be found to have rooted and may be transplanted. Seeds can be purchased of such nurserymen as Thomas Meehan of Germantown, Pa., for about $2 per pound. Cuttings may be obtained of any fruit nursery. The young trees should be transplanted to nursery rows for a year or so, and then set as desired in the orchard. The land should be well prepared and rather moist than very dry. 2. Thrash out the seed, or rub it out with the hands, and clean it on a fanning mill with sieves suited to the size of the seed. A small quantity may be cleaned by sifting and blowing without the use of a mill.

Grasses for Seed.

A Subscriber, N. Bennington, Vt., asks whether we would advise sowing 2½ bushels of orchard-grass; 10 pounds of clover, and a peck of timothy seed per acre. Would not the clover choke the orchard-grass? Would the latter get its growth as soon as the former, and whether it is as permanent as timothy—land, a clayey loam.

ANS.—With 2½ bushels of orchard-grass and 10 pounds of clover, the timothy could be dispensed with. In fact, 10 pounds of clover would be one-third too much, if the soil is good and a good catch probable. As clover and orchard-grass blossom, and are ready to cut and in their prime together, it is not advisable to sow timothy with them, unless there is some special reason for it. Orchard-grass is as permanent as timothy if it is cut early in June, and before its seed is set. To let it ripen greatly weakens the plant and prevents a rapid after-growth.

Scours in a Cow.

R. P. O., Winfield, Ohio, has a fine cow that for a year has been periodically troubled with the scours until she has been reduced to a skeleton, and nothing checks the ailment except fresh slaked lime, mixed with wheat flour and made into a pill. He feeds good hay and corn and oats mixed and ground, and he inquires what he should do for the animal.

ANS.—It is most likely that the cow's stomach is disordered and is too acid. It might be useful to give a pint of linseed oil and remove any crude matter from the intestines; then make a mixture of one pound of salt, eight ounces of carbonate of soda and one pound of prepared charcoal; mix these well together and give a handful in her meal at each feed. The lime will do more harm than good as soon as its alkaline and astringent effects have worn off, and no more should be given.

Laying out a Barnyard.

A Subscriber, Pleasanton, Iowa, asks how many square feet, in laying out a barnyard, should be allowed for different sizes of stock—calves, yearlings and older cattle—in order to best save the washing of the yard for manure.

ANS.—For 10 cows, 2500 square feet is not at all too much; that is, a yard 50 feet square. If there is straw enough to litter the yard abundantly, four times the space would not be too much. A yard for calves and yearlings should have at least 100 square feet for each. Older cattle require the more space on account of their pugnacious disposition towards each other, and the weaker should have ample room to escape the attacks of the master cattle.

Reviving Frozen Vinegar.

Subscriber, Plattsburgh, N. Y., has two barrels of vinegar that have been frozen to death, and he inquires whether there is any way of reviving it.

ANS.—If the vinegar had been separated from the ice while frozen, it would have been found very good and highly concentrated, in the center of the mass or distributed in numerous cells through it. After having been thawed, the best way to revive it would probably be to add a few pounds of sugar or molasses to it, and then add a few quarts of good cider vinegar, or some of the "mother" from cider vinegar. That will start a new fermentation which will in time produce vinegar.

Improving Yellow Corn.

F. R., Dundee, Ohio, asks whether yellow corn is not as susceptible of improvement as white.

ANS.—It is. Experiments on Penn. Yellow for four years prove that yellow corn can be improved. Dent and Soft Southern varieties, however, are much more difficult to improve than hard, flinty kinds. The more deteriorated corn becomes, the softer it grows and the more cob it makes. The stover is much more grass-like. No corn can be improved under pressure. Too much manure is as bad as none at all. The Yellow varieties demand that more and more care be exercised in feeding them, and attending to their demands.

Planting for Corn Premiums.

H. F. R. of Orrville, Ala., who competes for the corn premiums, desires to know whether the seed we send shall be planted within 33 feet square, neither more nor less, or simply that it shall not exceed that space?

ANS.—Simply that it shall be within *one* plot of 33 feet square. How much or how little within is not material to us. We would state that many who have received the seed corn, state that there are imperfect kernels. We were obliged to send the seed we received. As will be seen hereafter, the number of imperfect kernels will be so provided for as to render the distribution of premiums entirely equitable.

Bloating in Pigs.

W. S. H., Lavalle, Sauk Co., Wis., asks for a remedy for bloating in pigs. After the bloating begins, they gradually lose their appetite and die in about 10 days.

ANS.—The pigs are made sick by eating too much corn. The corn is heating, and indigestible when too much is fed to such young animals. It causes flatulence, which makes the bloating, and will produce inflammation of the bowels and death. They may be relieved by a dose of a teaspoonful of powdered ginger mixed with charcoal followed by some strong purgative, say, a tablespoonful of castor-oil, or more, according to the size of the animals. Feed no more corn, but oats or bran.

Fish as a Fertilizer.

A. P., Put-in-Bay, Ohio, asks how fish can be pulverized for fertilizing purposes.

ANS.—There is no need to pulverize the fish scarp; it is pulverized in the operation of drying it. If you refer to the use of raw fish as manure, and not fish scarp, that can be used by composting it with earth, swamp muck or coarse manure, and it will rot down and break up in the course of two or three months, when it is ready for turning over with the shovel. Any kind of fish, and even muscles, may be spread upon the ground and plowed in without any preparation.

Pearl Millet.

N. S. H., Waukegan, Ill., asks, 1, whether there is any danger of Pearl Millet "mixing" with corn, if they are planted near each other; 2, will the former mature seed in that locality; 3, if it is intended that it should ripen seed, should its treatment differ from what it should be if the plant is designed for feed.

ANS.—1. None. They are of different genera and species. 2. No. 3. For fodder only, it may be planted closely together, the same as corn. In this case we do not think it would show flowering heads at all. If planted for seed each plant would need at least 10 or 12 square feet.

When and How to Sow Clover.

W. P., Kent, Portage Co., Ohio, asks the best time for sowing clover, and whether the young plants are injured by frost.

ANS.—Much clover seed is wasted by sowing too early and also by scattering it upon the surface without covering. All seeds should be covered, although under very favorable circumstances, they would sprout and grow, even if not covered. If you harrow your wheat, that should be done as soon as the ground is dry; then sow the clover immediately after the harrow; the gradual leveling down of the little furrows made by the harrow teeth, will cover the seed. When clover seed is sown on the surface too early, a warm rain will sprout it; then a frosty night will destroy the young rootlets which have not yet penetrated into the ground, and the seed is wasted.

Ground-Bone. Manure for Corn.

T. B. B., Easton, Talbot Co., Md., asks, 1, whether ground bone will answer the purpose of lime on land that has had no lime for years; 2, the best manure for corn in the hill after or before plowing.

1. Bone will not be a substitute for lime unless an enormous quantity is used; it may be used with lime beneficially, as the lime will help to decompose it. 2. Peruvian guano is an excellent fertilizer for corn; and a good substitute for that may be made by mixing poultry manure, wood-ashes and gypum together.

Java Rice.

Mrs. J. S., Starke, Fla., asks for information about Java rice—where it can be obtained, etc. She has written to the Department of Agriculture, Washington, D. C., for some, but none could be supplied from that quarter.

ANS.—If any considerable quantity is required it could easily be procured through any of the coffee importers who have business with that country. There is no rice in the world that is better in quality than that grown in S. Carolina, while the Java rice is very inferior.

The Lady Grape.

H. B. R., New Canaan, Conn., referring to our allusions to the Lady Grape, asks if it is hardy; if it is white or black; when it ripens, and who sells it.

ANS.—It is with us as hardy as its parent, the Concord. It is white and ripens about Sept. 10. Nearly all of our nurserymen sell it. It is generally esteemed the best of the newer and not thoroughly tested varieties. That is our opinion. Geo. W. Campbell of Delaware, O., of whom it may be procured, was the originator.

Seed Drills

C. F. K., Tonawanda, N. Y., wants a machine that will sow all kinds of seeds, from onion seed in the garden to beans and corn in the field, and asks whether the "Monitor" could do such a range of work, or whether the Albany Cultivator would be preferable.

ANS.—The "Monitor" seed drill will answer the above purpose in garden and field; but the Albany planter is best for the field, as a horse can be attached to it, so as to greatly lessen the labor.

Paint for Wire Fence.

E. A. M., Wills's Point, Texas, asks what kind of paint should be use on barbed-wire fence that is corroding from wet weather.

ANS.—Any good mineral paint will answer the purpose. There is a paint made in Cleveland, Ohio, the iron-clad paint we think it is called, that is made from pulverized ore and would answer the purpose here mentioned. The Rubber Paint Co. of Cleveland, or H. W. John's Mfg. Co. of New York, have paints that will also suit exactly.

Baugh's Superphosphate.

D. E. H., Meadville, Pa., inquires as to the phosphate manufactured by Baugh & Sons of Philadelphia. Is it pure?

ANS.—We have to say that we know this firm to be trustworthy and have no doubt that the analysis which they print on every bag, accurately represents its contents.

Miscellaneous.

C. T., asks whether the RURAL NEW-YORKER ever went by the name of the Genessee Farmer; 2, where can he get good cane seed for making molasses; 3. He has been feeding corn-stalks all winter until there is a layer of them, 12 to 15 inches deep all over the yard and as there has been little rain thereabout, they are quite dry and he asks the speediest way of converting the lot into manure; 4, the lowest price of binding a yearly volume of the RURAL.

ANS.—1. No. The RURAL is the successor

of the Genessee Farmer. 2. Amber sugar cane can be procured of any seedsman who advertise in the RURAL, see adv. of J. J. Gregory in last issue; it is the best variety now grown; the cultivation is precisely like that of corn and it is worked up in the same manner as sorghum. 3. There is nothing to be done with the corn stalks but to leave them to rot, which they will do through the summer; and so get them ready for use in the fall. It is a poor way to use corn fodder. It would pay to buy and use a fodder cutter, and run the stalks through it, before they are given to the cows. The waste is then fine and can be used early in the spring for manure. 4. It can be nicely bound for $1.50

C. E. B., New Milford, Bergen Co., N. J., asks: 1. Whether rye, mixed with cut hay, is an injurious feed for cows giving milk, that will come in about Aug. 1st? 2. Why is new-made butter flinty? 3. His packet of seed-corn contains 128 kernels, and as he wishes to compete for premiums and the packet looked as if it might have been tampered with, he inquires whether he has about the right number.

ANS.—1. Too much rye would cause heating and liability to bowel derangement. Such concentrated food should be mixed with coarser substances—such as bran—two of the latter to one of the former. In this form, rye may be fed without danger. 2. Because not churned at the right temperature—60 to 65 deg. Fahr.—and by not being properly worked. The cream should not stand too long—not over three days. 3. We have not time enough to count the precise number of kernels in each of the thirty to forty thousand packages we expect to send out before the close of the distribution; but each subscriber gets precisely the same quantity by measure.

S. A. H., Burr Oak, has examined a berry of Defiance wheat with a microscope and has found on it minute cocoons. He sends us specimens of the wheat and inquires what insect produced the cocoons and how to destroy it.

ANS.—We found no cocoons in the kernel, only pellets of fecal matter such as are left by the larvæ of the little grain-moths of the family Tineidæ. These were quite abundant in 1877 on wheat procured the previous year at the Centennial Exposition. As the insects speedily disappeared, we presume they found the climate too cold for endurance. We think our correspondent need have no fear.

W. W., Courtney, Grimes Co., Texas, asks the pedigree of a stallion said to be sired by Rubel, and Rubel by Lexington; dam, a full-blooded Morgan mare.

ANS.—Close investigation into this matter leaves little, or no doubt, that there never was any such horse as Rubel by Lexington. We do not keep the records of racing or, indeed, of trotting horses; but inquiry of those who are "posted" on such matters, leads directly to the above conclusion.

Rural Reader, has a six-year-old Century Plant, the leaves of which die nearly as fast as they grow, and he asks 1, the cause; also, 2, what soil is best for such a plant; 3, how should the slips be taken off; 4, does it need much water.

ANS.—1. Examine the roots. It is probable they are attacked by worms or grubs. 2. Sandy loam; but almost any soil will answer. 3. The offshoots should be taken off in spring or fall, or, if under glass, at any time. 4. No.

J. W. C., Lowellsville, Loudoun Co., Va., asks what do we think of the new works of Conrad Wilson; would we advise him to get them to become a more successful farmer.

ANS.—Mr. Wilson has studied farming through a long life. Just exactly what view of farming he proposes to discuss we cannot at this moment tell. Special views of farming are all that can be taken in small works—the subject is one of an immense deal of cubic contents, if we may so speak.

B. S. P., Hudson O., asks our opinion of the Gregg Raspberry.

ANS.—We have not had it long enough to speak of it from experience. Reports, which we have printed from time to time, make it out of one the best of the Black-caps.

P. H., Lynn, Mass., asks how to graft young peach trees.

ANS.—The same as any other trees (See RURAL, March 15, '78)—but grafting here in the North seldom succeeds with the Peach. Bud in summer.

R. A. W., Genesee, N. Y., asks of whom can he obtain catalogues or circulars describing the varieties of Grapes mentioned in this Department, in RURAL of March 22.

ANS.—T. S. Hubbard, Fredonia, N. Y.—Ellwanger & Barry, Rochester—D. S. Marvin, Watertown, N. Y.

L. S. D., Booneville, Ky.—It is the rule of this office to answer every question received, either in this Department of the paper or by mail.

[For continuation of Queries, etc., see page 240.]

THE PEOPLE'S LIBRARY

In One Hundred Volumes,

Embraces History, Biography, Travels, Natural History, Physiology, Physical Science, Fiction, Belles-Lettres, Religion, Political Economy, Geology, and other important subjects.

IT SUPPLIES 45,200 PAGES OF MOST INSTRUCTIVE READING.

Sold upon Terms which Place it Within the Reach of All.

ITS AUTHORS A GUARANTEE OF ITS EXCELLENCE.

"THE PEOPLE'S LIBRARY" combines two great advantages: ***Comprehensiveness and Cheapness.*** It contains works upon all topics which the popular taste might reasonably be expected to embrace. Among its eminent authors are:

GIBBON,	MISS MULOCK,	ANTHONY TROLLOPE,	CHARLOTTE BRONTE,
HUME,	JOHN W. DRAPER,	BULWER,	CHARLES KINGSLEY,
GEORGE ELIOT,	HUMBOLDT,	MISS STRICKLAND,	MARIA EDGEWORTH,
CHARLES DICKENS,	WILKIE COLLINS,	WILLIAM BLACK,	GUIZOT,
JACOB ABBOTT,	J. G. WOOD,	MACAULAY,	CHAS. NORDHOFF,
THACKERAY,	G. L. CRAIK,	CHARLES READE,	J. W. DAWSON,
SCHILLER,	JOHN S. C. ABBOTT,	SAMUEL SMILES,	

The Publishers offer it at a price which is far below the aggregate price of the volumes of which it is composed. No other selection of books presents so varied and so large an amount of good reading matter, *for the money*, as THE PEOPLE'S LIBRARY. Cheap as it is, however, it must be beyond the means of many individuals who would gladly avail themselves of its advantages; and accordingly the Publishers suggest that in such cases the co-operative plan of purchase can be adopted. ***In every Village and Country District*** CLUBS can be formed, so that each subscriber can have, for a small investment, the free use and part ownership of a library of one hundred volumes of instructive and entertaining reading. ***The People's Library*** provides for the diffusion of useful knowledge. It supplies a demand that the intelligence of the people has created; it is a coadjutor of the public schools; its tendencies are elevating; its tone is pure. It carries the possibilities of mental culture to the most remote districts. It is a valuable acquisition to ***the Family, Literary Societies, and Associations.*** **Price, $100.00 per Set.**

CLUBS:—TEN persons, by paying $10 each; TWENTY persons, by paying $5 each; FIFTY persons, at $2 each, or ONE HUNDRED persons, by paying $1 each, can secure The People's Library.

☞ THE PEOPLE'S LIBRARY is published by HARPER & BROTHERS, New York, exclusively for H. W. DERBY & Co., and sold only by them or their duly authorized agents.

Send three cent stamp for a complete Descriptive Catalogue.

☞ ***AGENTS WANTED.*** Address. **H. W. DERBY & CO., Columbus, Ohio.**

214 Bushels of CORN TO ONE ACRE.

McClure's Prolific Corn actually produced 214 bushels of corn to the acre, on ordinary land with usual cultivation; proof of which was given in October issue of FARM & FIRESIDE. It is a large white variety; gives greater yield than any other corn under same circumstances; one grain produces several stalks and from 3 to 10 large ears; makes finest meal and best fodder. We will send 1 package, containing enough to plant 10 square rods, by mail post-paid, to any one sending 50 cts. for 1 year's subscription to FARM & FIRESIDE, the most popular Agricultural and Home Journal in the world. One package given as a premium for sending two subscribers to FARM & FIRESIDE at 50 cts. a year.

ALL OTHERS WANTING CORN

Can obtain it by sending 25 cts. for 1 package, or $1 for 5 packages, to J. S. CROWELL, Manager FARM & FIRESIDE, Springfield, Ohio, but send all subscriptions to FARM & FIRESIDE, Springfield, Ohio, as usual.

SPLENDID FLOWERS OVER 1200 Distinct Varieties

All strong Plants, each labeled, delivered safely by mail. **Largest assortment. Low prices.** In business **25 years.** *Guarantee satisfaction.* Stock comprises *all desirable varieties.* Only mature plants sent. Our new **Illustrated Hand-Book,** sent free, contains name and description of each plant, with instructions for successful cultivation. *Do not purchase Plants elsewhere before sending for our new* **HAND-BOOK** All *lovers of flowers* should have one. Every buyer of *cheap plants* should have it. Every one wanting *new and choice plants* should send for our *Hand-Book.* HOOPES, BROMER & THOMAS, CHERRY HILL NURSERIES, West Chester, Pa.

SATURDAY, APRIL 12, 1879.

IS THE BREED IN THE FEEDING TROUGH?

Replying to this query, we are inclined to make the paradoxical answer that it is foolish to think it is, and yet dangerous not to know it is. No profitable breed was ever made without liberal feeding. But feeding alone, however liberal, will not make a profitable breed. Feeding, care, and intelligent selection, are all required for the improvement of farm stock. And after a valuable breed is thus produced, its excellence can only be continued by a continuance of all these. Nothing is more wretched and worthless than a degraded thoroughbred of any kind. This is one reason why thoroughbreds are not more popular with the "old-fashioned farmers." They are creatures of high art, and in farming, high art and old fashions are strangers to each other. To take a fine Jersey cow, a choice Essex pig, an Oxford-Down sheep, and subject them to the methods that have developed the scrub cattle, the "elm-peelers" and the "fence scalers" of our pens and pastures, is not the way to show them off to a good advantage.

The old breeds are tough, for the same reason which the Dutch farmer gave for his wife's resignation to die: "Mine Gott," said he "She hat to be!" Now the very methods taken to develop the profitable qualities of improved stock, —the liberal and varied feeding, the rich pasturage, the warm stables—all have a tendency to lessen their power of resistance to extreme hardship. It is simply a question whether it is better to have "tough" cows that will make 100 pounds of butter a year, or such as must have more care and better feed, but will return 300 pounds in the same time.

Probably nine-tenths of the farmers, even of New England, New York and Pennsylvania, have as yet little or no blood of foreign breeds in their stock. Yet they possess many beasts that are good and profitable. Our "native" animals are as easily improved by proper care, feeding and breeding, as those of any part of the world. The *judicious* introduction of foreign blood will often hasten the development of desired qualities. But never, *never*, NEVER will it do so unless, along with it, we take the methods that made it what it is. And *with* those methods it is simply a question of greater or less time to make as good or better thoroughbreds upon the basis of our "native" animals. This is most important to be known. It is not yet by any means so well known as it ought to be.

CONCENTRATED FERTILIZERS—OUR ADVICE.

Parties advertising concentrated fertilizers usually present, in circular form, a long list of recommendations from those who have used them. Our readers ought not to be influenced by such recommendations, no matter how well the names may be known to them. The commercial fertilizer sold this year may be very different in its valuable ingredients from that sold last year—and the commendation of a neighbor as to how much a certain brand benefited a certain crop in his field, is no guarantee as to its effect upon the same or a different crop in another field.

If your neighbor uses 1000 pounds of superphosphate on his acre of corn, and produces 100 bushels, that is no proof that 1000 pounds of superphosphate will produce 100 bushels of shelled corn on *your* field—it is no sort of evidence that it will.

The readiness with which one farmer will buy the same fertilizer that seems to have helped his neighbor's crop, brings to our mind a fanciful case like this: Farmer A. up to Jan. 1st, 1877, weighed 175 pounds. During the year he gained in flesh so that by Jan. 1st, 1878, he weighed 225 pounds. Now farmer B., whose weight was only about 150, knows of this change, and seeking farmer A. asks: "What have you done to gain 50 pounds in one year?" "I will tell you," replies farmer A.: "It happened that during 1877 I ate about twice as much *fish* as ever before in the same length of time, and, no doubt, my increase of weight has been due to that. At least there was no other change in my diet or life to which I can attribute it—therefore, I say, no doubt it was the *fish*." Farmer B., impressed with the force of this reasoning, eats thereafter two fishes where previously he had eaten one; but the end of 1878 found him in weight just 150 pounds. Accosting farmer A., farmer B. says: "I have followed your fish diet during the past year, but I am no fleshier than at its commencement." "Well," retorts farmer A., "I am not the less satisfied that it was the fish which added so much to my weight. It only goes to show the truth of the old adage that what will kill one will cure another."

In the first place, there is no proof that it *was* the 1000 pounds of superphosphate that produced the 100 bushels of shelled corn. The large yield *might* have been due to one or to fifty other less apparent causes. But even if the superphosphate *were* the cause of the large yield, the same amount upon farmer B.'s field might produce no manifest increase of yield while, perhaps, had he used nitrate of soda or potash, his yield might have been as great as that of farmer A.

We say to our farmers who propose to buy concentrated fertilizers: "First—*Be sure what you are buying. See that you get what you pay for.* Chemical analysis may assure you of this. One superphosphate at $20 per ton may be worth to you less than one-quarter of the value of another superphosphate that costs twice as much. Second—We say do not conclude that *your* land needs nitrogen, potash or phosphoric acid because either one or all of them seemed to produce fine crops for your neighbor's. Last, we say, before you purchase special fertilizers at all,—experiment in a small way for yourselves with fertilizers of the simplest composition; such as burnt bone, nitrate of soda, muriate of potash. There are a number of trustworthy firms in New York, Chicago, Boston, Philadelphia or Baltimore, who will supply any or all in small quantities which will enable you thus to experiment in a small way and at a small cost. In this way, (*if at all*) you may learn *approximately* what your land needs. You can learn in no other way except by a probably ruinous waste of money."

TREATING.

Some time ago (July 27, 1877) we suggested in the Rural that the friends of temperance might promote the cause for which they are laboring, by inducing young men to abstain from the common practice of treating, and proposed that a society be formed, the members of which should pledge themselves to pay for no liquor to be drank by others, and to drink none that another paid for. Such a society is now established in New York, and is, we understand, in successful operation with good results. Perhaps the originators of it, however, were as little aware that we had suggested it, as we were that the same thing was advised by one of the Governors of New England nearly two hundred and fifty years ago.

We recently found in Cotton Mather's "Magnalia Christi Americana"—a quaint, curious and rare old book—the following: "There was one civil custom used *in* (and in few *but*) the English nation which this gentleman [Gov. Winthrop] did endeavor to abolish in this country; and that was *the usage of drinking to one another.* For although by drinking to one another, no more is meant than an act of courtesie, when one, going to drink, does invite another to do so too, for the same ends with himself; nevertheless the governor (not altogether unlike to Cleomenes, of whom it is reported by Plutarch *Nolenti poculum nunquan præbuit;*)* considered the *impertinency* and *insignificancy* of this usage, as to any of those ends at all, but only to provoke persons unto *unseasonable* and perhaps *unreasonable* drinking, and at last produce that abominable *health-drinking* which the Fathers of old so severely rebuked in the Pagans, and which the Papists themselves do condemn, when their casuists pronounce it, *Peccatum mortale provocare ad æquales calices, et nefas respondere.*† Wherefore in his own most hospitable house he left it off; not out of any silly or stingy fancy, but merely that by his *example* a greater temperance, with liberty of drinking, might be recommended, and sundry inconveniences in drinking avoided; and his example accordingly began to be much followed by the sober people in this country, as it now also begins among persons of the highest rank in the English nation itself; until an order of Court came to be made against that ceremony in drinking, and then, the *old wont* violently returned with a *Nitimur in Vetatum.*"‡

*Never urged the reluctant to drink.
†It is a deadly sin to challenge another to a drinking match, and it is impious to accept such challenges.
‡A bias toward a forbidden indulgence.

THE REVOLUTION IN DAIRYING.

It is scarcely more than a year since the Western people were complaining that the brand "Western" upon their dairy packages conveyed an inference of inferiority of quality, and was accompanied by a decided inferiority in market value. Eastern men said patronizingly, "raise the quality of your goods and the market will respond at once;" "make Western butter equal to ours, and the prices will regulate themselves."

At the same time they rested confidently in the opinion that such a state of affairs could never occur. They slept on that idea just as the hare in the fable slept on the idea that the crawling tortoise could never overtake her in the race. But Eastern dairymen have been awakened in a most startling manner. Western creamery butter stands at the head of the market, and Western dairymen carry premiums at the exhibitions. As usual, the West has gone ahead. It is a Western habit to do that. With all their pertinacity and vim born of their Eastern origin, together with the surpassing advantages of their locality, Western men have left their Eastern competitors in the rear, simply because they discovered what was wanted by consumers of their produce, and then went to work and produced it.

They found that sweet, fresh butter was wanted in place of "State firkins" and tubs packed in June, and they went to winter dairying; had their cows fresh in the fall; fed them on early-cut hay and their rich and cheap corn; used all their natural advantages and acquired the necessary skill; turned out an excellent product and swept the market. And now the Eastern men are cogitating how they may recover their lost ground. They are in the rear just now, and "a stern chase is always a long race;" but whichever wins in the end, the public, who consume the butter and cheese, will be the gainers.

ROSE CULTURE.

One of the first secrets of success with the Rose in guarding against its several persistent insect enemies, such as the rose-bug, green-fly, rose-slug, etc., is to keep the plant healthy and in vigorous growth. To insure this, a rich soil is indispensable. Let it be composed of old decomposed sods or thoroughly rotted manure. This earth should never be permitted to *bake;* but should be kept friable by frequent stirring. The aphis, or green-fly, first attacks the young, tender shoots, feeding upon their juices. The pests may be killed by placing a barrel over the infested plant and burning tobacco in a flower-pot or other vessel underneath. The rose-slug, that green-bodied, jelly-like pest that feeds upon the surface of the leaves, leaving only the the veins and ribs, may be kept in severe check, if not destroyed, by dusting the plant with fine coal ashes. The rose-bugs may be brushed off into a pail of water, or picked off separately by hand and destroyed. As much as has been written about the culture of the Rose and about its insect enemies and their destruction, the above, in our experience, embodies the whole story.

A suggestion to those who have received a packet of the Pearl Millet we have sent them, is this: Take a three-inch pot and plant therein one of the seeds. By the first of June the plant will have grown to some size. Turn it out in the middle of a flower-bed, the soil of which has been made as rich as can be. It will make an immense plant by midsummer, that will prove, for the rest of the season, as ornamental as many others that are cultivated for ornament alone. In this way, too, no doubt Pearl Millet will seed freely. We should like to hear from those who act upon this suggestion. Our largest plant last year (without extra care or a rich soil) grew to the hight of ten feet one inch, and girthed about sixteen feet. We should much like to know what *can* be done with this plant if given the *best* of garden culture.

BREVITIES.

The hard frost of last spring which so injured Grapes, all small fruits, potatoes, melons, cucumbers, beans, etc., etc., was on May 14.

Mr. F. Corbin states in his interesting little work about Plymouth Rocks, that this breed is by the best authorities thought to be a cross between a single-combed Dominique cock and a Black Java hen.

Our Querist Department is so full this week, chiefly with timely inquiries, the condensed answers to which will be very useful to many of our readers at this busy season, that it has forced out our "News of the Week," a mishap the less to be regretted, inasmuch as the news of the past week has been of little general interest.

By the use of the words *ensilage* and *silos*, needless mystery has been thrown over the preservation of cut-up green corn stalks and leaves, through the winter for stock. It will be seen that the corn leaves and stalks are treated upon much the same principle on which celery is stored in trenches for the winter. And that is about the whole story.

A friend asks us: "What commercial fertilizer shall I buy for my oat field?" The question is a simple one—it is as plain as the nose on one's face. We wish we could answer it. It would seem that information as to such questions lies at the end of a long, rough road, and that at the end of it, each field, by experiment, must give that information.

The Gartner-Zeitung, speaking of a reminiscence of the Tulip Mania, says that two houses in the main street of Hoorn, near Amsterdam, were offered for sale for demolition. These houses were purchased during the Tulip trade which flourished from 1854 to 1637, with the proceeds of three Tulip bulbs. The record of this purchase was preserved in a stone inserted in the gable of one of the houses.

Dr. Sturtevant reminds his readers in the Scientific Farmer that "when a farmer plows a furrow of seventy-eight yards in length when he could as well plow a furrow two hundred and seventy-four yards in length, he is getting a waste of three hours and twenty minutes out of a day of eight hours; or, if the day's labor of men and team be reckoned at three dollars, he is losing by the short length of furrow about $1.25 a day. This, though an extreme case, does not lessen the force of the argument."

Prof. Brewer says that farmers, as a general rule, are not good gardeners. He says that the time when a large field is waiting to be sown, upon which field the farmer expects to raise a crop from which his income is to come, is the very time when his garden needs attending to; and while his garden is an important thing for his own table, it is not his business, and if either is neglected, it is his garden rather than his field. Farmers do not raise as good vegetables as gardeners do, because it conflicts with their regular business.

Our readers will remember the frequent references we have made to that excellent work, "The Native Flowers and Ferns of the United States," by Thomas Meehan. We are gratified to learn that the series finished "has proven so acceptable to the public that another series has been prepared and will appear about midsummer." And then we hope another and another will appear, for it is at once the most elegant, interesting and instructive work of its kind that has ever been published to our knowledge. The colored plates alone are worth the cost of the work.

Four years ago we made tests with all of the good and promising new sorts of cucumbers—not for pickling but as cucumbers to be sliced up and eaten with vinegar, etc., as they are usually prepared. Our report was that "Tailby's Hybrid" was the tenderest, had the fewest seeds, was, in short, the best. Ever since that time we have made occasional references to it in the hopes of securing for it a general appreciation. We are glad to see that our friend Mr. Gregory, of Marblehead, now advertises it as a "prize for any garden." We should prize the cucumber, more had Mr. Tailby called it by any other name than a "Hybrid."

The old system of cutting cemetery grounds into small lots surrounded by hedges, bids fair to pass away entirely. All over the country, the park landscape or lawn system is gaining favor. It consists in a series of plantations of shrubs and trees, so arranged that the effect of the entire cemetery, from the main drives, is that of an extensive park, all evidence of existing burial grounds being shut off by foliage. Of course, in this system, the hedge-and-fence monstrosity finds no place. Vaults or catacombs are excavated in the hillsides, and memorial buildings of all kinds erected in retired nooks. More land is required for this arrangement, but its attractive, rural character seems to commend it to all.

Mr. J. S. Woodward reports to the W. N. Y. Hort. S. as follows: "One part of the orchard, belonging to Mr. Haynes, of Newfane, was badly infested with the canker-worm, or something like it. He procured a force-pump and sprinkled the trees with water containing Paris-green. This not only entirely rid them of the canker-worms, but to his surprise those apples which grew in that part of his orchard were entirely free of codling-moth worms, and though he and his family have eaten freely of the fruit, they have found no trouble from the poison, and he is very sanguine in thinking this a cheap and very effective remedy for this pest." Now we earnestly hope that these recommendations to use Paris-green will not be heeded. The destruction that its free use *may* cause is beyond our powers to surmise. Its use to exterminate the potato-beetle may be excused, perhaps, but even in in this case it may lead to ills which we have never dreamed of.

It is a poor sort of philosophy that sets itself up to negative the plans offered by thinking men, without offering better ones in their place. Nevertheless, the belief is strong upon us that the many sorts of bands used to exterminate the Codling-moth will never appreciably lessen their numbers and that the use of them is, consequently, time and money thrown away. Unfavorable conditions of the weather or a natural enemy would do more to exterminate them in one season than any such measures of our own, in a lifetime. It is natural to the earnest horticulturist to work unceasingly for the benefit of horticulture; but we respectfully ask that the natural increase of the Codling-moth, as compared with the numbers which are likely to be killed by the general use of bands, be fairly considered. Is it not best to oppose all labor or appliances which evidently cost more than they are worth?

For Women.

CONDUCTED BY MISS FAITH RIPLEY.

OVER THE BARS.

'Twas milking time, and the cows came up
From the meadows sweet with clover,
And stood in the lane, while pretty Jane
Had a quiet chat with the drover—
Such a quiet chat that it scarcely seemed
That a single word was spoken;
While a magic spell with the night dews fell,
And the rythm of song was unbroken.

The cattle stood at the lovers' side,
Without any show of vexation,
As though impressed with a five-bar rest
Was a part of their rest-oration.
And as Jane listened to the notes that came
Right under the bars and over,
Her heart took wing, the silly thing,
And nestled up close to the drover.

She heard him say his home was poor,
That he'd nothing but love to give her;
And she smiled content, as though Love had spent
Every arrow he had in his quiver;
She smiled content, when the evening air
With voices of birds are ringing,
And her lips confessed that a lowly nest
Should never prevent her singing.

So over the bars the lovers lean,
In the joy of their sweet communion;
And their looks declare that poverty ne'er
Shall be a bar to their union;
O, sweetest music, go thread your rhymes,
Now under the bars and over;
Where pretty Jane, in the fragrant lane,
Bewitched the heart of the drover.

DESCRIPTION OF ENGRAVINGS.

No. 1.—Easter Egg. A hen's, goose's or duck's egg may be used. Make a hole in the center and empty the contents; then lay the shell in vinegar for five minutes; this gives it a delicate whiteness. Then take a fine saw, separate the egg-shell

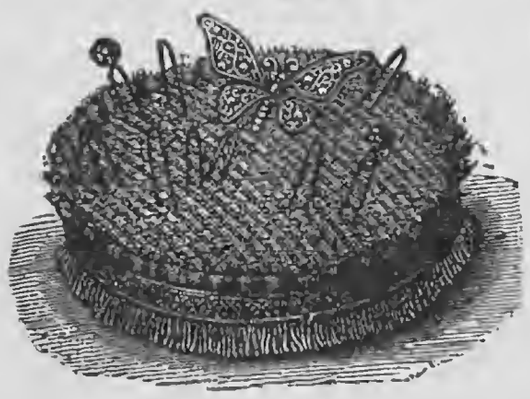

FIG. 3.

lengthwise, cutting the inside skin with a sharp knife. The shell is ornamented with a painted monogram, and fastened with very narrow ribbon. It should be filled with pink jeweler's cotton and may contain any small present.

No. 2.—Basket to hold Easter Eggs. The foundation of the basket is of cardboard; the bottom is oval, measuring seven inches long and five inches broad; the side is two and one-half inches high, and long enough to go round the oval bottom. The cardboard for the handle is one inch wide and twelve inches long. The embroidery for the side is worked on Java canvass in cording stitch, with blue crewel. The cardboard must be lined with blue silk and sewn neatly together; then the embroidery sewn at the sides, the edges of which may be made neat by a row of button-hole stitch. The basket is filled with dried moss, and the eggs arranged in it according to taste.

No 3. Hair-pin Receiver. Small paste board box is used for a foundation. Top covered with two or three thicknesses is of ordinary worsted crocheted; a yard of ribbon, ornamented on each edge with worsted fringe completes the "Receiver."

No. 4. Fashionable Fan. Marabout feathers ornamented with a hand-painting of a rose.

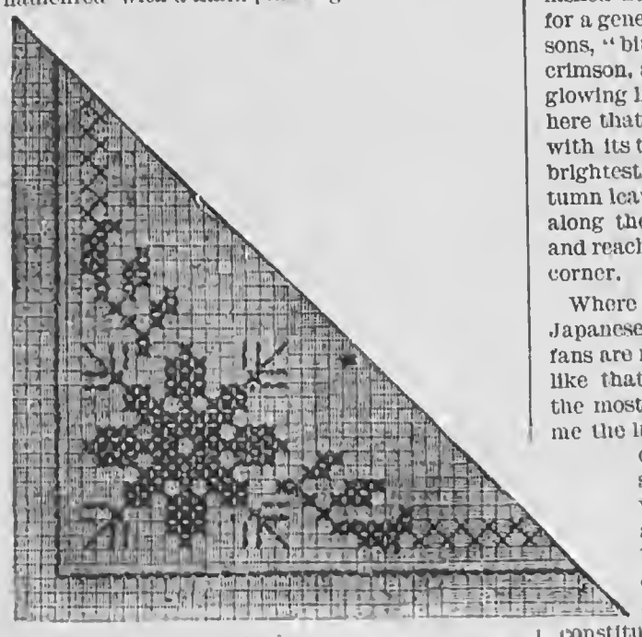

FIG. 6.

No. 5. Fancy Waste Basket. Frame is of ebony, sides of blue silk or satin embroidered in two shades of the same color. Handsome silk tassels finish the corners.

No. 6. Design in cross-stitch embroidery. This is suitable for corners of table covers or towels.

CORNERS.

ELLA RODMAN CHURCH.

What is there about corners that make them so irresistibly attractive? From childhood's earliest game of "Puss-in-the-corner," until the period when the time-buffeted man looks forward to a "snug corner" as the goal of his earthly hopes, there is a strong prejudice in favor of them. Corner houses, corner lots, corner wedges of pie (especially pumpkin baked in square pans), are all objects of desire; while to "corner" any one is decidedly to get the better of him.

One's own corner at home, with chair, writing-table and book-shelf—with the addition of work-basket, or meerschaum, as the case may be—how dear it grows to one's heart! And how the interloper who presumes, in the serene power of ignorance to appropriate it, is inwardly, at least, frowned upon! Who ever thinks, though, of becoming attached to the middle of the room? This seems by general consent to be regarded as a sort of Tom Tiddler's ground, or unsettled waste; while all the encampments are made in corners.

The soft nothings that have been whispered there!—ah! if walls had ears or were echoes, it would be seen that stair-cases are nothing to them. "In a Corner" would be an admirable title for a romance, and how much might be made of it.

One objection, perhaps, to corners is the unpleasant fact that spiders like them, too; but a persevering application of essence of broom will always succeed in dislodging these aborigines, and persuading them that the comfort of those particular corners, at least, is intended for their betters.

In the arrangement of a room, corners are not sufficiently honored; very few people understand them. Of a broken or shabby thing, it will be said, as a matter of course, "Put it a corner—it will never show there;" or of superfluities, "They will do to fill up odd corners;" when an "odd corner" should be treated as a valuable background for whatever of rich or rare in the way of small articles one may happen to possess. Indeed, I might almost go so far as to say, "Take care of the corners, and the rest of the room will take care of itself"—but will restrict it to the assertion that, if corners were treated as they should be, many a dull-looking room would bloom into beauty.

The line made by the joining of two walls should never be left bare.—art, if not nature, abhors such a vacuum; and this is the particular spot where, in that most delightful of all rooms, one not furnished according to any particular rule and used for a general gathering place at all times and seasons, "bits of color," in the shape of scarlet and crimson, are most effective. It is here that the glowing lines on the plain-tinted paper show best; here that the scarlet, or crimson, draped bracket, with its trailing ivy, or other creeper, gleams the brightest. A pillared stack of richly-glowing Autumn leaves, sumac, maple, oak and beech, fringed along the sides with quivering, shadowy grasses, and reaching from dado to ceiling, is beautiful in a corner.

Where grasses and leaves are not to be had, Japanese fans are. For it is an exploded idea that fans are meant to fan with: their legitimate use is like that of sunshine, to glorify a room. One of the most cheerful-looking rooms I ever saw gave me the impression, on first entering, that a swarm of mammoth butterflies had taken possession of the corners, and expanded their wings contentedly over the pictures. But a closer inspection revealed the fact that brilliantly-tinted folding-fans were spread out, butterfly fashion, over the modest engravings and heliotypes that mostly constituted the works of art; while the corners of the room were ornamented with stacks of the round-handled kind, on which the most gorgeous tints in the most impossible of combinations ran riot. The carpet was dingy, and the furniture principally ditto; but there was a general effect of cheerfulness and beauty.

That endlessly-accommodating plant, the ivy, is especially at home in corners, and gracefully clothes the naked lines with a robe of lovely green. A corner cupboard is always bewitching—whether it be of carved ebony or of painted pine. Triangular shelves, too, are delightful, something in the way of a surprise: and a row of three, like a set of steps, will furnish any corner appropriately. A vase, or bust, on the upper one—books on the lower—a cup and saucer, perhaps, on the one between—and your corner is complete; especially, if the vase holds a vine that pursues its winding way to the ceiling,—or the grotesque figures on a stack of Japanese fans climb obligingly down to meet it.

I love corners dearly; and when I see them empty and uncared for, I always feel like putting the owner of the room into one of them,—more as punishment, however, than in the way of decoration.

CORRESPONDENT'S CORNER.

Mrs. L. M. Shields, Otsego Co., N. Y.—Yeast

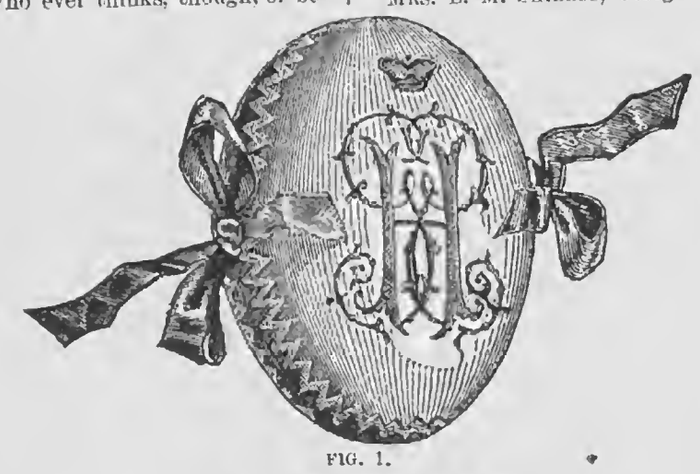

FIG. 1.

poultices are made in New York hospitals as follows: Mix a pound of linseed-meal or oat-meal into a half pint of yeast. Then heat the mixture over a gentle fire, stirring carefully to keep from burning. When it becomes warmed through it can be spread on linen like any other poultice. Unless expressly ordered by a physician, I should give the preference to slippery-elm or flaxseed for poultices.

Will some one who has tried it for herself give "Farmer's Wife" a good recipe for staining or painting her kitchen-floor? Send answer to Rural office, care of Faith Ripley.

Mrs. M. M. W., Pittsfield, Mass., would like some experienced Rural housekeeper to tell her how flannels can be washed without shrinking. Send answer as above.

Literary Miscellany.

AN UGLY GIRL.

(Continued from page 224.)

Mrs. Estcourt drew her chair nearer to the table, and laid her hand, with a very demonstrative "Bless you, my dear boy!" on the shoulder of her stepson. Noel averted his face a little, and shaded it from her view: he could not but feel very much agitated; for he was as full of hopes and aspirations as any other healthy, handsome young fellow of four-and-twenty would be. Hitherto he had, as he confessed, scarcely realized all that lay before him; but now, as he sat with the attributes of luxury around him, obsequiously addressed as "my lord," his opinion deferred to, and all the harassing worries and makeshifts endured during weary years of pinching economy sinking into insignificance, his heart began to swell with exultation.

FIG. 2.

But Mr. Whitely was clearing his throat, and, as he unfolded his papers, he cast such a penetrating glance at Noel, that the latter could have fancied this shrewd lawyer divined the thoughts that had been passing through his mind.

"Before reading the late Viscount's will," his solicitor premised, "I have a revelation to make which will, I think, very much surprise you."

"Nothing that my poor friend did could very much surprise me," muttered Colonel Jenkinson, pulling his long, white moustache. "After being told that he was in the habit of letting his servants give him whatever they pleased for dinner, and shutting himself in his rooms from month's end to month's end, I shall not be astonished to hear that he committed still greater eccentricities."

"The act of which I am about to speak can scarcely be classed under that term," answered Mr. Whitely, dryly; "although the Viscount's conduct since it occurred must be termed odd and unusual."

"Couldn't we hear the will first, and all these trivial details afterwards?" demanded Mrs. Estcourt, who was impatient of any delay.

"Permit me, madam, to finish what I was about to say. It has always been supposed that the late Viscount was an unmarried man; but this is not correct."

Mrs. Estcourt gave a faint shriek, and sat upright in her chair, while Noel felt the blood recede from his cheek.

"About twenty years ago," the lawyer went on, satisfied that he had now secured attentive auditors—"about twenty years since, Lord Carisforde, during a visit to Rome for the purpose of purchasing some rare antique, met with a young English girl, governess in the family of one of the Roman nobles, and married her for her beauty."

"Married! Alas! my poor children!" moaned Mrs. Estcourt. "Cruel, disgraceful man!"

"Lord Carisforde brought his bride to England, but only to jealously seclude her in a country house he rented near Dorking; for she was so exquisitely beautiful, that he was quite annoyed by the notice she attracted wherever she went. Within a year of their marriage, however, this poor young lady, whose brilliancy of complexion was, it appears, owing to incipient decline, gave birth to a daughter, and faded away soon after."

"Then there is an heiress in existence!" cried Mrs. Estcourt, panting with vexation. "But the title—they cannot take that away from you, Noel! and some of the property *must* go with it!"

"A poor five hundred a-year," interposed the Colonel. "I have heard Carisforde mention it frequently."

This the lawyer confirmed; and Mrs. Estcourt, more noisily affected than her son, complained of being faint; but no one noticed her, for Mr. Whitely had gone on to say:

"It is only within these last few months that I have been made acquainted with the facts I relate to you, for Lord Carisforde was a very reserved man."

"And was ashamed of the low marriage he had contracted!" cried Mrs. Estcourt, vehemently.

"Hush, mother!" exclaimed Noel, annoyed at the virulence with which she spoke; and Mr. Whitely flatly contradicted her.

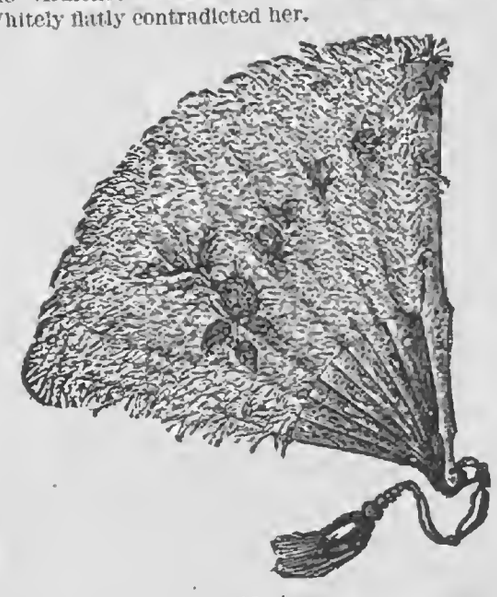

FIG. 4.

"You are quite mistaken, madam. My client attached no importance to birth or station; but he adored beauty in all its forms, and he married because the young lady bore an extraordinary likeness of an exquisite statuette of Psyche that stands in a niche in his dressing-room. He had a fancy that to such uncommon loveliness of form and face great purity of mind must be allied; and in this case I have every reason to believe that he was not mistaken. Lady Carisforde's death was a terrible shock to her husband: and he felt it all the more because unfortunately, her little daughter inherited none of her charms. He confessed to me that when he first saw his child, her ugliness so revolted him that he could not endure to behold her again."

"But surely he strove to overcome a feeling that must have inflicted such pain on its object!" exclaimed Noel.

"He never did overcome that horror, my dear sir, till he was siezed with his last illness, and his physicians hinted to him that his recovery was hopeless. Then, and not till then, he told me of his marriage, and permitted me to send for Miss Carisforde."

"How old is she? Does she inherit her mother's weakly constitution?" asked Mrs. Estcourt, in a tone that disgusted her hearers.

"The young lady is about nineteen, and enjoys robust health," the lawyer rather maliciously replied.

And Mrs. Estcourt turned from him, protesting that the Viscount must have been insane.

"Eccentric he may have been," the solicitor brusquely retorted; but his mind was as sound as my own. Depend on it, ma'am, any attempt to upset his will would be unsuccessful."

FIG. 5.

"No such attempt will be made," interposed Noel, with decision. "You were speaking of Miss Carisforde. Is she here?"

"Yes, she was brought from the secluded house at which her mother died, to witness the last moments of the father whom till then she had

not known. I am informed that she did not leave his side, except to snatch a few hour's rest, until he expired."

"Perhaps her looks had ceased to shock him," suggested the Colonel. "They may have improved with her growth."

"I believe not. I have not seen Miss Carisforde, for she shuns strangers; but the Viscount, when dictating his last bequests, told me with a sigh that, in spite of her goodness, he has found it very difficult to reconcile himself to her appearance, for she was in all respects the very antitype of her lovely mother."

"The will, sir—let us have the will!" cried Mrs. Estcourt, who detested suspense.

"You shall, madam; but as Miss Carisforde is a party concerned, I should wish her to be present;" and at the lawyer's request Noel touched the bell at his elbow. "All that I have to say in conclusion is, that the young lady's filial attentions made her father regret that he had estranged himself from her so long, and he bade me tell you, Lord Carisforde, that in framing this, his last will and testament, he bore in mind not only your claims as the successor to his title, but hers as his only child; and he has so worded it as to atone to his daughter for past neglect, and to your lordship for his inability—consistent with justice to another—to give you the estates as well as the peerage."

"Young man," exclaimed Colonel Jenkinson, turning solemnly to the half-stunned Noel, and shaking his hand, "I am very sorry for you. It is hard—extremely hard upon a lad of spirit to be pulled up short just as he thought he had a fair field before him. But discipline your mind to endure defeats. There's nothing like discipline; nd if you feel inclined to enter the army—it's the finest profession in the world—why, come to us. We'll give you a hearty welcome, and make a good soldier of you."

"Oh! this is dreadful!" wailed Mrs. Estcourt, drawing out her handkerchief. "My poor children! what will become of you if your unnatural brother deserts you? He ought not to have exposed me to this dreadful—dreadful disappointment!"

"The lady talks as if she were the party aggrieved," the Colonel observed, in Mr. Whitely's ear; while Noel, by hinting that she must consent to leave the room unless she composed herself, prevailed upon her to be silent.

A servant now appeared, who was sent to request the presence of the Honorable Ada Carisforde; and Noel Estcourt reseated himself, his curiosity to know the precise position in which he would find himself, overcoming in some measure his regret that he had cherished expectations which were not to be fulfilled.

CHAPTER III.

THE READING OF THE WILL.

The servant sent to summon Miss Carisforde to the reading of her father's will returned in a few minutes with her excuses. She would much prefer, she said, to leave her interests in the hands of the gentleman who had guarded the Viscount's so faithfully; but if it was absolutely necessary that some one should be present, might she not be represented by her friend and companion, Miss Hillian Gray?

Mr. Whitely demurred a little. He preferred to do business with the principal, he observed, rather stiffly. If, however, Miss Carisforde felt incapable of appearing, why there was no help for it, though he still hoped she would make the effort.

The messenger returned a second time to say that his young lady did not feel equal to the effort, and Mr. Whitely muttered a peevish expression as he looked at his watch.

"Then by all means let us have Miss Gray, for my time is up. I wish ladies would remember that a professional man can ill afford to be kept waiting while they are making up their minds."

"I should have liked to see my old friend's daughter," Colonel Jenkinson observed, regretfully.

"Poor thing," said Mr. Whitely, already repenting his testy speech; "I am told that she is so very sensitive about her looks that she has not taken an occasional airing in the grounds since she has been here without hiding her face behind a thick veil. They do hint that she is positively repulsive. A great—a very great misfortune for a girl in her position. Perhaps if Mrs. Estcourt, as a relative, were to kindly go to her——"

"I am not a relative," was the prompt reply, "and my nerves are in such a weak state that I really could not expose myself to further shocks. It was very inconsiderate of Noel to bring me here, knowing how unequal I am to any agitation."

Her stepson opened his eyes, but said nothing. It was not worth while to remind her that she had literally forced herself upon him; and there was a short pause, during which the Colonel had recourse to his moustache. Noel, growing restless, rose and walked to the window; Mrs. Estcourt sighed and sniffed dolorously, while Mr. Whitely fidgeted with his papers, and finally jumped up to ring another peal on the bell.

"The companion is as thoughtless as her mistress. Anyone would think that my time is of no consequence. Oh! here is Miss—Gray, isn't it? You are very welcome, young lady; for I have an appointment at eight o'clock, and cannot afford to be kept here any longer."

He spoke so brusquely, that the shy, pale girl who had timidly hesitated on the threshold, appeared half inclined to retreat again. When Mr. Whitely placed a chair for her, she advanced a few steps; but only to make another doubtful pause as the voice of Mrs. Estcourt reached her ear.

"I neither understand why we have been kept waiting for this young person, nor why she is here at all. In a family-meeting, such as this ought to be, it is not pleasant to have one's most important concerns discussed before a dependent."

The girl to whom this gratuitous insult was directed shivered and retreated. But while she did so, instinctively she cast an appealing glance at the male occupants of the room, as if in mute entreaty that they would protect her from the shrill-tongued woman who thus coarsely protested against her presence. Perhaps her eye, attracted by the tall figure standing at the window, may have rested there a moment longer than on the others, and Noel answered the appeal it conveyed by crossing the room and placing himself beside her.

"You forget, madam," he said to Mrs. Estcourt, in tones stern enough to frighten her into better behaviour—"you forget that this young lady accepts this unpleasant office to oblige Miss Carisforde and me."

Taking Illilian Gray by the hand, he lead her to her seat, and then, by asking a few trivial questions of Mr. Whitely, gave her time to wipe away the tears that were stealing down her pale cheeks.

But for his stepmother's ill-nature, he might neither have wasted look nor thought on the modest little companion of the Honorable Ada Carisforde; but now he could not resist glancing across the table once or twice to see if she had recovered her composure. From these furtive glances he discovered that she had one of the sweetest faces he ever beheld. By no stretch of imagination could she have been called beautiful, for her features were irregular; taken separately, none of them were good except her eyes, which were so dark a hazel as to be almost black. Noel thought that timid, tearful Illilian Gray, with her black dress dusty and crumpled—as if she had been lying down with a headache when summoned to the drawing-room—and her hair rough and partially unbraided, had one of the most feminine, winning countenances that he had ever beheld.

But while Noel was thinking this, Mr. Whitely was wading through the customary preamble, reading with a deliberation that provoked Mrs. Estcourt terribly. The will was unusually short and simple, for Lord Carisforde had formed no friendships during the latter years of his life, and had outlived those of his youth, with the exception of his *camaraderie* for Colonel Jenkinson, who was remembered with a massive service of plate.

To each and all his servants he bequeathed twelvemonth's wages, but to the heir to his title, nothing; for all his property, real or personal, was devised to his beloved and long-neglected daughter Ada.

Though Noel's heart sank when he heard this and knew that he should leave the Park as poor a man as when he entered, his regrets were trifling ones compared to his stepmother's. Fortunately for everyone present her warring emotions deprived her of her power of speech, and the lawyer was able to proceed with the reading of a codicil he now produced.

After giving directions that a favorite horse should be shot, the Viscount had appended an explanation of his motives for the seeming injustice which rendered his heir a landless peer.

"Since I have known and loved my child," were the words of the document, "I have craved to live for her sake. This is denied me, but I cannot die till I have made some reparation for the past as well as a fitting provision for her future. Her misfortunes debar her from being sought in marriage for herself, and therefore I feel that I shall best secure her happiness by leaving to her all I possess, subject to the condition that she shall give it with her hand to my successor in the peerage, Noel Estcourt."

"I solemnly enjoin the said Noel Estcourt—of whom I have heard such a good report that I can have no hesitation in trusting him—to be a good and faithful spouse to Ada my daughter, and not to slight or neglect her on account of her unhappy want of comeliness; to treat her always with the consideration and courtesy due to her rank; and if she continues to think it best that she should live in seclusion, to let her fix her residence wherever she pleases; and also to take care that she has a sufficient annual allowance to enable her to gratify every reasonable desire."

"I believe this is all, my lord," the lawyer slowly said, as he came to the bottom of the page. "I must beg you to understand that I had no part in the wording of this will. I hope," he added, with a faint attempt to be jocular, "that the young lady and gentleman whom it most directly concerns, will find no difficulty in complying with its behests. Then your lordship will be able to keep up the ancient *prestige* of your name, and Miss Carisforde will—I say this without a thought of flattery—have to thank her father for providing her with a bridegroom who will do honor to his position."

"It's—it's dreadfully unjust!" groaned Mrs. Estcourt. "The property ought to have gone with the title."

"It will do so if the present Lord Carisforde agrees to the arrangement proposed by the late one," Mr. Whitely reminded her.

"But this girl must be hideous—positively hideous! What a sacrifice for Noel to make! and I had planned everything so nicely! We should have been very happy here, especially if we could have kept him to ourselves for a few years; but I am doomed to be unfortunate!"

"Hush, mother!" said Noel, taking her hand kindly. "We will still try to be happy. At what time will you be ready to return to town?"

Mrs. Estcourt's face lengthened.

"Must we go back directly? No, no! Why should we? Of course, the will must be acted upon. I will be the first to see Miss Carisforde, and endeavor to accustom myself to her; and then you——"

"Pay any kind attentions to Miss Carisforde that your heart dictates," Noel interposed. "Remain here with her if she feels her loneliness, and wishes you to do so; but do not imagine for a moment that I could ever be so despicable as to entertain the idea of marrying a girl I have never seen, and whom it would be impossible to love."

"Hush—hush! my dear lord," whispered the lawyer. "Don't make rash resolves, nor forget that we are not alone."

Noel glanced in the direction of Illilian Gray but was only in time to catch a glimpse of her black skirts as she noiselessly flitted from the room.

However, he did not doubt that she had heard his last words, and would repeat them to the heiress; and so far from regretting them as rash, he rejoiced that neither Miss Carisforde nor her friends would be able to accuse him of any mercenary wavering. He wished, though, on second thoughts, that he had not spoken of the poor recluse as a girl for whom it would be impossible to feel any affection. Had not her affliction been brought before her forcibly enough without its bitterness being increased by his emphatic declaration?

"It's a splendid property," Mr. Whitely went on to say. "Lord Carisforde occasionally spent large sums; but his estates were productive and would bear it. I hope, my lord, I shall live to see you master of Carisforde, not in name only——"

"Listen to me—pray listen for one moment!" cried Mrs. Estcourt, who had been vainly endeavoring to get a hearing, and now saw that her stepson was on the point of repeating his former declaration. "Noel must have time given him for consideration. It will never do for him to be bound by anything he has said to-night. He is vexed—disappointed; he is smarting under a sense of having been unfairly treated; he cannot view the Viscount's will in the favorable light in which I am beginning to regard it. We shall stay here, Mr. Whitely; we shall make the acquaintance of our young relative, and if she is as amiable as you describe her——"

But Noel would hear no more. He flung off the hand that lay on his sleeve, and entreated Mrs. Estcourt to desist.

"It is impossible, mother, for me to act as you wish. The late Lord Carisforde's money was his own, and he was justified in bequeathing it to his only child. Remember, that if it were not for her sex, she would have inherited with it the title that is so useless to me."

"It would not be useless if you——"

"If I consented to become a pensioner on the bounty of my young kinswoman? Never!"

Mr. Whitely was so interested in the young man's decision, that he forgot his haste, and stayed to say:

"But, my dear sir, if you will not embrace the opportunity offered to you—if you will not try and win the heiress, what will you do?"

"Yes, Noel—yes; Mr. Whitely is quite right in asking this!" cried Mrs. Estcourt. "You must not let your pride make you selfishly forgetful of *my* claims."

"I will never be that," he answered, with a sigh. "But neither will I stoop to a mercenary marriage. I would rather go back to London and return to my situation, if Messrs. Nivett will consent to reinstate me."

"Viscount Carisforde, the last of an ancient line, a clerk in a banking house! Oh! it is too absurd!"

"Nay, mother; when I quit this house I shall lay aside a title which is useless to me."

Mrs. Estcourt wrung her hands.

"And leave this splendid estate to a chit of a girl who never ought to have lived! Don't tell me it's unfeeling to talk in this way! I hate her!"

"But I do not," answered Noel, quietly. "I owe her no grudge. I shall try not to covet aught she possesses, but regard what has passed as one of those delusive dreams with which Fortune sometimes tricks us."

"But to go back to town!" sobbed Mrs. Estcourt—"to the old house—the old life—to be as poor, as pinched as before! Oh! Noel, is there no middle course? Have you no pity for me?"

"Yes, yes! there is—there shall be!" said Mr. Whitely, melted by her tears, even though they were shed solely for herself. "I will make a point of having a little talk with Miss Carisforde on the subject. She is bound to do something for your lordship. She would be the most ungenerous of girls if she did not agree to settle a handsome annuity on you."

Noel drew himself up proudly.

"I beg that you will not do anything of the kind. I have already said that I distinctly decline to be Miss Carisforde's pensioner. Had her father and I been more nearly akin, or if he had ever held out hopes that I should receive any legacy at his death, I should then have reason to consider myself aggrieved. As it is, though I may regret that your professional reserve or ignorance of my real position prevented you from warning me that my real portion would be an empty title, I will not impute blame to any one."

Mr. Whitely was a kind-hearted man; and, though he thought the young man too scrupulous in refusing to woo an ugly bride, whose tocher would be such an ample one, he felt truly sorry for him. But he was in a hurry, and contented himself with shaking Noel by the hand warmly, and begging him to write to his address if he altered his mind, or there were any other way in which, by his advice or influence, he could serve him.

Noel thanked him gratefully, and they were separating with mutual expressions of good-will, when a stifled shriek and a heavy fall made them both turn hurriedly to Mrs. Estcourt. She, poor woman, never accustomed to exercise much self-control, and now compelled to see that Noel was determined to act for himself, was suffocating with rage and disappointment. She wanted to detain Mr. Whitely, to induce him to aid her in one more appeal to her obstinate stepson; but her emotion robbed her of speech, and she fell upon the floor, writhing and moaning so convulsively, that Noel, who had learned to endure her hysterical attacks with stoical composure, saw that she was now really ill, and hurried to her assistance.

Mr. Whitely rang for the housekeeper, the nearest doctor was sent for, and his remedies abated the violence of the attack; but as he recommended that his patient should be removed to bed, and positively declared her return to town or even removal to a hotel impossible, the intensely annoyed Noel saw that he should be compelled to spend this one night, if no more, beneath the roof of the heiress for whose sake his own claims had been set aside so completely, and, we may add, so provokingly.

(To be continued.)

WEAKER THAN A WOMAN.

(Continued from page 222.)

CHAPTER XLV.

It was a pleasant evening; the dinner-party was bright and cheerful, and after dinner the guests had music, cards, and conversation. More than once Lady Chevenix made room for Felix near her and talked to him. But, if Lady Chevenix was unusually kind, Mrs. Haye was unusually cold to him; whenever she saw her daughter talking to him, under some pretext or other she interrupted the conversation. She tried to patronise him; but all efforts at patronage recoiled upon herself. There are some men who never will be patronized, and he was one; his natural pride and dignity of character quite prevented it.

The evening was a pleasant one. Lady Chevenix was a charming hostess; she neglected no one. She had the rare gift of making every one feel perfectly at home, and each one separately seemed to be her most favored guest. Felix could not help contrasting that visit with his last, when she had suffered such tortures of anxiety and humiliation. He could not help thinking of the unhappy man who had died so young, a victim to his own folly—the man who had once been master of all this wealth and had made bad use of it.

It was a pleasant evening. If Felix had been more vain, he must have seen with what great respect and consideration he was treated—how Lady Chevenix deferred to him on every point—how she consulted his tastes, his wishes, his convenience. If he had been more vain, he would have been more flattered by it—he would have seen it. But he did not. The chief thing that struck him was the coldness and reserve of Mrs. Haye.

During the next few days father and son worked hard; they rose early and did not leave work until it was time to prepare for dinner. Darcy Lonsdale declared that Lady Chevenix would spoil him. She devoted herself almost entirely to their comfort; she studied them.

At the end of the third day there yet remained three or four hours' hard work.

"We must go to-morrow," said Darcy; "we must leave the first thing in the morning, let what will happen."

Felix decided to go back to his writing immediately after dinner, and not to pause again until he had finished. That was the only plan. Lady Chevenix smiled thoughtfully when she heard it.

"It will be best," she agreed. "I will see that Felix has a cheerful fire and refreshments. How good you both are to work so hard over my affairs!"

So when the dinner was ended, Felix went back to the library and began to write. Lady Chevenix sent him a cup of her favorite *cafe noir*. Later on a servant carried in a refreshment-tray, which was placed on a table near him. He heard the sound of music and laughter, which, as night drew on, ceased. His father came in and said, "Good night" to him; and then silence fell over the house.

CHAPTER XLVII.

As Felix Lonsdale wrote busily, there came to him the memory of a story he had read in which a lawyer like himself had sat alone in the library of a country-house, and the spirit of its dead owner came to tell him of some wrong that he had done in his life.

"It is a pleasant thought;" smiled Felix to himself; and then he was startled for a moment. A faint odor of violets floated near him, and, looking up, he saw Lady Chevenix.

She was standing by his side, looking down on him with a light on her face that had not shone there for long years. Never had this beautiful woman looked more beautiful than now, with her charming head bent over him, standing in the half-darkened room like a vision of light. The crimson glow of the fire and the soft radiance of the lamp on the table fell over her. She wore a very handsome dress, which showed her lovely shoulders, her white neck and rounded arms—a dress that in the ruddy firelight presented most marvelous hues. With it she wore a diamond necklace, and diamond stars shone in the golden hair.

There was something more than beauty in her face; he knew it the moment he raised his eyes and saw her. There was love—love such as had not shone there since she had bidden him farewell. The firelight gleamed on her jeweled hands, on her marvelous face, her golden hair. She stood before him in all the pride and magnificence of her wealth and her loveliness, a vision such as rarely greets the eyes of men. And, as he looked at her, with somewhat of wonder and inquiry on his face, she sank slowly on her knees, and bent her head before him.

"Lady Chevenix," he cried, "you must not do that! I cannot allow it!"

She laid her hand on his arm—the hand on which shone her wedding-ring.

"Listen to me, Felix," she said—and the sweet voice stirred unwontedly his heart and soul. "I have waited impatiently for this hour. You are going away to-morrow; and I must speak to you to-night. Marian is in the ante-room; there; I brought her with me. I told her I must speak to you to-night, and she came at once. Felix, will you listen?"

"How can I help but listen?" he replied. "What do you wish to say to me, Lady Chevenix?"

With a charming gesture of impatience she laid a finger on his lips.

"You must not call me 'Lady Chevenix,'" she said. "I am 'Violet' to you. Say 'Violet,' and then I will tell you what I came for."

Perhaps, if he had had time to prepare himself, to think matters over, to take some precautions, he would have known better how to listen and what to say. As it was, she seemed suddenly to have taken possession of him, of his whole nature.

"You make me say what you will, Violet."

She clasped her hands, and laid them upon his arm.

"I want to tell you a story, Felix," she said—"give me your attention while I narrate it. Years ago there was a girl—young, foolish, and, the world said fair. She was vain too of her beauty, and expected to achieve great things with it. She loved with all her heart some one who was more than worthy of her love, and she promised to be his wife. But sorrow and misfortune came to him, while a wealthy wooer sought her—one who offered her wealth and title, houses and lands—and she—well, I am ashamed of her, Felix. She was vain, and much weaker than a woman; she was young too, and not over-wise. She had nobility enough, however, to see what was right though not to do it. She was tempted by her love of luxury and comfort—she was badly advised, wrongly influenced; and she, weaker, I say again, than a woman, gave up her lover—the one man in the world whom she loved—and married the wealthy suitor. How she suffered no one knows, no one can tell. Her marriage turned out to be a most disastrous one. She had money, luxury of every kind, but she never had one moment of happiness—one moment of peace, of rest. She had outward gaiety, outward brilliancy and pleasure; but her life was one round of lamentation and anxious sorrow. No one knew what she suffered; no one knew how she regretted the lost true dear love who would have made her life a heaven on earth. After she was married she met him again, and—well, he was always cold and distant to her. What she thought and what she suffered was known to herself. Then, after long years of humiliating servitude, she was alone again, and free. What do you think she did, Felix?"

"I cannot say," he replied in a low hoarse voice.

"I will tell you. After those long years she found that she still loved the dear companion of her youth. She said to herself that he had never married—perhaps he still cared for her—and one night, when he was sitting alone, she went to him—as I have come to you—knelt by his side—as I kneel by yours—and prayed to him—as I pray to you—'Oh, my lost love, my dear love, forgive me, and take me to your heart again!'" And the lovely head drooped until it lay upon his arm.

He made no answer just then. His whole soul was stirred within him—his whole heart touched. After a few minutes she raised her face to his, and he saw tears upon it.

"Violet," he said, "I do not know what to say to you. You have taken me so completely by surprise. I am lost—bewildered. I cannot collect myself."

"I thought you would say 'Yes' to me at once," she returned sadly. "Oh, Felix, have you not forgiven me? Tell me that first. Have you forgiven me?"

He looked at her thoughtfully, watching the firelight gleaming on her golden hair and on her rich jewels.

"Yes; I have forgiven you, Violet—I forgave you long ago."

"Quite, or was it only a half forgiveness, Felix?"

"Quite," he replied. "I am sure of it. My heart was full of hot anger for many long months, but it died away; and then, when I saw that you were not happy, I forgave you."

"With all your heart, Felix?"

"With all my heart," he answered; and then there was silence for a few minutes between them.

"You forgave me? Then, Felix, why will you not take me into your heart again?"

His face grew deadly pale—his hands trembled. She saw such deep emotion in his face that her own grew pale.

"You see but one side of the question," he said. "Now listen to me. I loved a girl, Violet—ah, heaven, how I loved her! She was the very light of my eyes! She was the pulse of my heart! She was the very soul of my life—my one priceless jewel! She loved me—her fair face brightened for me—her sweet eyes rained love and kindness on me—her voice made all my music! I had no life outside her sweet life! Heaven forgive me, I worshipped her—no man ever worshipped a woman so madly, so blindly, or so well! If at any time my poor life would have served her, I would have given it. If at any time I could have died for her, I would have died. And she was kind to me. It drives me mad even now, when I remember that she once placed her arms around my neck and promised to be my wife. Then over the heaven of my content what clouds came! I was working—as man seldom works—to make a home for my darling and place her in it. I was seeking every picture, every ornament that I thought would beautify a home, for one who would herself adorn it most. What happened? A wealthier lover came—not, mind you, one who loved her more, not one whom she could love—a man, to say the best of him, coarse of soul and hard of heart; he could not even appreciate the exquisite loveliness of my love. He held out his hands to her, and they were filled with gold; he offered her title, money, jewels—everything that women love. He laughed to scorn the notion that any tie to me bound her. 'Leave him,' he said—'he is poor. Come to me—I am rich.' What did she do, this love of mine, who held my heart in her hands?"

The beautiful head drooped lower and lower.

"Have pity on me, Felix," she cried—"have pity!"

"I do not mean to be hard; I am only telling the truth. This is my version of the story, Violet. What did she do? Did the first noble instincts of true womanhood come to her? Did she turn with fidelity to me? No. She flung my love back in my face, she trampled my life under her feet, and she crushed my heart in her hands—she jilted me! Nay, do not shrink from the word, Violet; it is the only one. She jilted me—left me to be the subject of men's laughter and women's jeers—left me a burning fire of anguish that nothing could slacken or cool—left me with my life ruined."

Again she raised her hands to him, and cried—

"Have pity on me! You are terribly hard."

"Nay, I am but just, Violet. And then this woman who had left me to laughter and ruin came to me with a smile, and asked me to take her into my heart again. The past, which had been one long agony to me, was to be condoned by a smile, the torture of years to be soothed by a few kind words!"

He stopped; the passion of his own words mastered him.

"You said you had forgiven me, dear," and Violets hands touched his clustering hair.

"Yes; I have forgiven you. Listen to me, Violet. She came to me again, this woman who had betrayed me, with the dead man's spoils in her hand. She came to me bright with jewels, radiant with their magnificence his wealth had provided for her—the wealth for which she left me. She held out her hands laden with treasures; she brought to me the spoils her perfidy and falsehood had won for her. I should be less than a man if I shared those spoils with her—should I not, Violet? When you left me, and men laughed because you had left me for money, my very sorrow had a dignity in it. What should I be now, even in your eyes, if I took you back to my heart with the same money that your falsehood had won? I should be less than a man."

"I cannot understand you," she said, piteously.

In his passion he seemed to rise to a hight which that weak soul could not reach; but the pitiful pleading voice touched him and made him gentle again. He looked down into the lovely face.

"Violet, you will understand this. Suppose that when you loved me most I had left you and had married a rich woman—a woman whom I did not love, but married solely because she was rich—that she died after a few years, and I came back to you with her money in my hands, and asked you to share it—would you do so?"

"Yes, I think I should, Felix."

"Perhaps I might have expected such an answer from you. I would not act in such a fashion. I would be less than a man now to take dead Sir Owen's gold, and with it you.

She looked at him with a half-bewildered air, yet still seemed to think that she could persuade and soften him by sweet words.

"I have been so unhappy without you, Felix," she murmured. "You do not know all; it seemed to me as though I had lost the half of my soul when I lost you—it is not wrong to say so to you now. I was very unhappy, Felix. I found out soon afterwards that I never could be happy without you."

He made no answer, and she took courage. She laid her face on his arm. The waves of golden hair fell over his hands.

"Do forgive me, Felix," she said. "I was so young, and so thoughtless. I did not understand."

So she knelt, while the firelight played over her, and the face of Felix Lonsdale was turned from her.

"I am sorry for it all, Felix," the sweet voice went on—"so very sorry. You see, dear, there were great excuses for me, though they do not seem great to you. I was very vain—every one flattered and praised me, and I was led away. I thought my beauty was great enough to merit any station. Then, Felix, I was so young—oh, my dear, forgive me, I was so young—and foolish! I have repented of it ever since. I love you now just as much as when we stood in the moonlight together."

He raised her face and looked into it. It was beautiful enough to tempt any man to forego honor. He looked into the depths of the violet eyes.

"You are sorry for it, Violet," he said—"really and truly sorry?"

"Yes; I am indeed, Felix;" and her hands were clasped round his own. "I am, dear—my life has been all regret."

"Answer me truly—if the time came over again, would you act in the same manner?"

The soft eyes wavered half a moment, and then fell.

"I cannot tell; it cannot come over again. That is a strange question. Answer me one—truly, Felix. Do you love me?"

She saw the sudden gleam of passion light in his face and deepen in his eye.

"Do I love you? Yes. Heaven help me, I do! If I did not love you, I should not suffer."

"You are quite sure that you have not met any one since whom you liked ever so little, Felix?"

"No," he answered; "when a man has loved a woman like you, Violet, it is not easy to forget her."

"Then, Felix, if you love me and I love you, why should we not be happy? What stands between us?"

"My own honor," he replied—"my dignity as a man, my pride as a gentleman. If you were penniless, Violet, I would kneel to you, I vow, and pray you to be my wife."

"What stands between us, Felix," she asked again.

"Your dead husband's gold—the gold for which you broke your plighted troth and left me. You say, Violet, that you were young and thoughtless when you sinned, that you hardly realized all you were doing. I believe that. Suppose now I believed in you, and again let myself drift upon the golden sea of hope and love. Some wealthier suitor might come—an earl this time—and you would leave me once more."

"No, never again," she cried, clinging to him—"never again!"

(To be continued.)

CAMPHOR BALLS.—Clarify a pound of mutton suet and add to it three pounds of spermaceti, two of white wax, and one of gum camphor cut into very small pieces. Melt these together with gentle heat and stir until the camphor is dissolved, then pour it into molds. Frequent applications of this emollient will prevent disagreeable roughness of the hands. Should they become chapped, a most effectual but slightly inconvenient way of healing them is to wrap them in wet cloths with an outside bandage of flannel, first making a free application of the camphor balls. This treatment will soften and whiten the roughest skin, and it is also an excellent application in chronic rheumatism.

VOICES OF THE NIGHT.

WHEN bed-time comes and curtains fall,
And round I go the doors to lock,
Ere lamps go out my wife doth call,
"Remember, dear, to wind the clock!"

When boots are off, and for the day
All irksome cares seem put to rout,
I hear wife's voice from dreamland say,
"Be sure you put the kitten out!"

When stretched between the sheets I lie,
And heavy lids have ceased to wink,
From trundle-bed there comes a cry,
"I want a dwink! I want a dwink!"

Chicago Tribune.

RECENT LITERATURE.

Spiritual Songs, with Music for the Church and Choir. REV. CHAS. S. ROBINSON, D. D. New York: Scribner & Co. Price, in cloth, $1.50; in American gros-grain silk, $2.50.

This is a choice collection of songs for religious worship, judiciously classified and unusually well indexed. The type and paper are excellent; and the silk binding makes a most beautiful as well as a unique cover. The book meets a long-felt want in the churches, viz: a work that shall be equally good for choir use or congregational praise. There are nearly eleven hundred hymns in the collection, very fully indexed, and an unusual number of tunes. The author has shown a wise discrimination in his omissions as well as in his insertions. All the old favorites are to be found, as well as newer pieces of undoubted merit. Altogether the work is beyond peradventure the best collection of hymns ever offered for church service.

MAGAZINES.

SUNDAY AFTERNOON FOR APRIL has the following table of contents: My Cup Runneth Over, Lucy Larcom; The Mormons, T. L. Rogers; Christianity and the State, Oliver Johnson; Calvin the Sinner, V., VI., VII., Josephine R. Baker; Why? Elaine Goodale: The Tenement House Question, Helen Campbell; The Outer Gate, E. C. Gardner; Provided For, Elizabeth A. S. Chester; Dives and the Angel, Elizabeth Akers Allen; The Howgate Scheme of Arctic Discovery, S. J. Douglass; Jack, Margaret H. Eckerson; A New Chapter on Wages, D. W. R.; Palissy the Potter, Isabella T. Hopkins; Did God make that Man in Vain? Henry P. Goddard; What the Toucan said to the Macaw, Lizzie W. Champney; The Still Hour; Editor's Table—Mint, Anise and Cummin: College Frauds; Our Laws and our Law Makers. Literature.

OUR LAWS AND OUR LAW MAKERS.—The close of the Forty-fifth Congress suggests a few sober reflections upon the quality of current legislation. Probably the late but not much lamented national legislature was no worse than many of its predecessors: but when we consider the nature of the enterprises to which it has devoted the larger part of its time and energies, the prospect of wise and safe legislation is not so bright as we could wish. It is a fact which no member of Congress would think of denying that the main occupation of the last session has been politics and not law-making. In other words the principal concern of the great majority of both parties has been to prepare for carrying future elections rather than to attend to the present business of the government. The main question of the average Senator or Representative is "How can I inflict the most injury upon the other party and make the most capital for my own?"

* * * * *

It must be remembered that this is a representative government, and that the people are likely to choose legislators who fairly represent them. If they are ignorant and brutal, their ignorance and brutality will find voice at Washington, and in the State Capitols. And by the rapid immigration of great masses of ignorant Europeans and the sudden admission to the suffrage of some millions of ignorant negroes, the average intelligence of our voters has been greatly lowered. The percentage of the wholly illiterate in the voting population is much larger than it was fifty years ago. Of course the result of this change will appear in all the current legislation and administration. The stream will not rise higher than its fountain, and the people are the source from which political morality as well as political power is derived.

In view of these facts the only adequate remedies that suggest themselves are these: a more self-denying devotion of educated men to public affairs, and a more thorough education of the people.

The educated classes ought to have more influence in public affairs than they now have; though they are in a minority the power which their training gives them can be wielded with great effect if they will only put themselves in contact with the people, and, divesting themselves of the scorn of ignorance, work patiently for the enlightenment of their fellow-citizens. In such service as this they will encounter no end of discouragements: but this is the kind of service to which patriotism and Christianity unite in summoning them, and the urgency of the summons can hardly be overstated. The college instructors will do well to teach their young men political science; but they will do better if by precept and example they teach them the supreme obligations of citizenship, and so train them that they shall seek to carry into politics not only the learning that they have gained, but sound moral principles and patriotic sentiments.

Not only by the participation of educated men in political affairs, but also by vigorously prosecuting the work of elementary instruction in the common schools, the people must be educated.

The churches, too, have something to do in this work. They ought to be, as they always have been, educators of the people in the great concerns of government; but, better than this, they ought to be strengthening the bond that is suffering just now a severe strain—the bond that unites in one community of interest rich and poor, learned and ignorant. By preventing the segregation of classes in our society, by keeping the people of all grades in fellowship and sympathy, the church may furnish a medium for the communication not only of kindly feelings but also of intelligence from one class to another. To the churches themselves, as well as to the nation, this kind of work is of vital importance.

By the faithful use of all these means we may trust that the average intelligence and morality of the whole people will be gradually increased, and that thus our legislatures will grow wiser, and our laws more just. The process will be slow, and there will be need of faith and patience, but there is no reason for despair.—*Sunday Afternoon for April.*

A LIBRARY FOR THE PEOPLE.—In another column will be found the advertisement of H. W. Derby & Co., of Columbus, O., the proprietors of the People's Library. The collection of the People's Library is a happy thought. The books are judiciously selected and are printed and bound in the best style, and the appearance of the whole collection of one hundred volumes is at once pleasing and attractive. The works of the best known and most popular writers have been carefully examined, and some of their choicest productions have thus been selected for a place in the People's Library. Schools, colleges, families, lodges and societies of all kinds will find the People's Library a wise and economical expenditure of the small sum requisite to obtain it. Purchases are most easily effected by means of the co-operative plan. A club of twenty persons, for instance, by an individual payment of $5, can secure the Library, and for the payment of this small sum each member has the use of one hundred dollars' worth of books. A plan more simple and feasible can scarcely be devised. Every rural district by co-operation may establish in its midst a choice library. The larger the membership of the club or society, the less the expense to members, and the more extended the usefulness of the library.

CONTENTS OF HERALD OF HEALTH, FOR APRIL, 1879.—General Articles — Physiological and Sanitary Marriages and Parentage, by the Editor; A Hygeian Farm Home, by the Editor; Disease Germs. Our Dessert Table — His Temperance Pledge — An M. D's Love Poem; Topics of the month — James Parton concerning the Health Habits of Bayard Taylor; Mr. Gladstone's Habits —William Howitt; Mr. Alcott's Summer School of Philosophy—Rev. C. H. Brigham; Letter to the Editor; Studies in Hygiene for Women — Healthfulness of Bread made from Unbolted Wheat-meal; Bread from Minnesota Flour; Meat for Children; Oatmeal Crackers; Society and Solitude; Paint and Paper for Houses; A Respiratory Vail; Physical Deterioration of New-Englanders; Current Literature — Health Foods.

PAINT AND PAPER FOR HOUSES.—In another part of this magazine we have given some general directions for building a healthful farm-house. We should like to add a few words applicable to any house, on the subject of paint and paper. In the first place, all the painted wood-work should be varnished; in this way the deleterious ingredients of the paint are rendered harmless, and the cleaning is much more easily accomplished. In regard to paper, it may be said that all rough papers should be avoided, because they collect, absorb and retain too much dust. All papers containing arsenic or Paris-green in their coloring should be avoided. The smoother the surface of the paper the better. Whenever rooms are to be repapered, all the old paper should be removed.—*Herald of Health for April.*

SCRIBNER'S MAGAZINE for April, is a most attractive number, as will be seen by the following table of contents: Actors and Actresses of New York, Illustrated, J. Brander Matthews; Haworth's, VI., Illustrated, Frances Hodgson Burnett; In a Snailery, Illustrated, Ernest Ingersoll; Holy Russia, Edna Dean Proctor; The Stickeen River and its Glaciers, Illustrated, W. H. Bell; Anemone, Elaine Goodale; Admonition, Augusta Moore; Falconberg (conclusion), Hjalmar Hjorth Boyesen; The New Moon, Andrew B. Saxton; A Trip to a Political Convention; John Ericsson, Illustrated, William C. Church; The Tendency of Modern Thought as seen in Romanism and Rationalism, C. C. Tiffany; Half-witted Guttorm, Kristofer Janson; Henry Bergh and his Work, Illustrated, C. C. Buel; The Portrait, David S. Foster; Fraulein, Adeline Trafton; The Token, Richard Henry Stoddard; The Measure of a Man, Illustrated, William Page; A Canticle of Spring, Mary E. Bradley; Departments.

STONE PLANING MACHINE.—A machine for planing granite and other hard stones has been brought out that promises to prove of value in reducing the cost of preparing building stones. It consists of an oblong frame of iron, supported at the corners, and carrying a movable platen, somewhat after the manner of iron-planing machines. On this is placed a strong head-piece or tool-holder, and by means of a system of long pulleys and corresponding belts, power may be brought to the tool whatever its position during the work. The block of granite to be planed is placed on a hand-truck and rolled under the machine and raised by means of jack-screws to the proper level for the work. The revolution of the cutting tool planes down the stone at about the pace of the iron planers, and performs the work in a manner fully equal to hand labor. The tool is fed to the work by hand, one man being sufficient for all the work.—*Scribner for April.*

THE hair of a mummy examined by Mr. Frank Buckland, the English naturalist, was found to be 'banged' in the way common to modern youn ladies. Then they want to tell us the girls of the present day are more frivolous than their ancestors!

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

HOUSE-MAIDS.

As a class, are those who serve us, treated with due kindness? Are we not sometimes indifferent to their feelings, and to their comfort? It is so natural, so easy to see faults, that the mistress is apt to overlook the good qualities that her maid possesses. The fact that she is obliged to labor, entitles her to some consideration. The "maid of all work" is often compelled to labor beyond her strength, and at unseasonable hours, as if the employer was determined to get full value for wages.

The room that is assigned to the maid, is not always attractive and homelike. If there is a ragged spread in the house, it is thought good enough for *her* bed. If there is a broken chair, it is put into *her* room. A bit of broken looking-glass will answer for *her*. Perhaps there are no conveniences in the apartment for making a thorough toilet; so she must make a dressing-room of the kitchen, which ought never to be used for such a purpose. And who thinks of putting a plant in her window, or of hanging a picture on the wall? A bright painting of flowers, inexpensive though it be, would have a good effect upon her. In regard to meals, she is as a rule, easily pleased. She carries the fragrant tea and coffee, and the tender steak and hot vegetables to the table. The family partake leisurely of the well-ordered meal, she fasting and working, until her turn comes, when she must be satisfied with the remnants.

Domestics have *rights* that ought to be respected. If they wish to go to the church of their choice, on Sunday, they should be allowed, if possible, to do so. If they desire to go out for an evening in the course of the week, it is best that they be gratified, so that they are in, at the proper time for retiring.

Now let us look at the other side. There are domestics who do not seem to appreciate kindness. Like over-indulged children, the more done for them, the more they expect, and the less gratitude they show. But such instances are, I believe, rare. There are few persons who go out to service in kind families who cannot be impressed by a genuine interest shown in their welfare, by those who employ them.

The management of hired service is an *art* that requires patience, firmness, and watchfulness. The mistress of the household should never allow herself to be taken advantage of, by yielding her views and ways to those of her maid. A very competent girl sometimes gets the idea that her services are so valuable, that rather than lose them, her employer will give up her own authority, or increase the girl's wages. When the house-maid reaches such a conclusion, her speedy dismissal will be the best thing, all around.

Two maids are more difficult to get along with than one alone. They rarely agree, as one may be ill-tempered, the other, a shirk. I would rather work harder myself, than to increase my cares by keeping two, except temporarily. Of course, only small private families can be so independent as to the number of domestics kept.

A lady should know how to do all kinds of house-work, that she may be better able to instruct those she employs. And not only that, but in case they leave her suddenly, she will not be perplexed or embarrassed like one ignorant of domestic affairs. M. G. R.

Lyons, Iowa.

NASTURTIUMS (Tropæolums).

We hope to impress upon our housewives at this time the desirability of planting nasturtiums for pickles. This excellent salad-plant deserves more popularity than it has ever yet received, as we think a trial of it this season will satisfy most of our friends. The tender shoots and buds are a pleasant addition to any salad, while the flowers furnish high-colored garnishing for many dishes. But it is of the young fruits preserved in vinegar that we particularly write. Gather the fruit on a dry day when about two-thirds grown, with a part of the peduncle (flower stalk) attached and drop into cold vinegar. When a sufficient quantity has been gathered to fill a bottle, pour off the vinegar, add a little salt, scald up, return and seal. They may be used for stuffing mangoes or peppers, with cabbage, cauliflower, beans, little onions, etc., and they will be found a very good substitute for capers in drawn butter. But as pickles these nasturtiums, properly put up, are as spicy and appetizing as anything that we know of among the many vegetables used for such purposes. As to culture, when the production of fruit is the first consideration, the soil need not be rich. The dwarf varieties are best. These may be planted in rows in the garden the same as peas, supported by a little brush on either side, or they may be planted in double or triple rows, in which case each row will sufficiently support the other.

HOW TO POP CORN.

Put in a pan a heaping teaspoonful of butter or clean lard, a good pinch of salt and a small handful of pop-corn; cover and put over the fire. Butter or lard improves the popping qualities of the corn and it pops better than on the wire or screen hoppers. There are several other methods of popping corn, but this has given satisfactory results to those who have employed it.

DOMESTIC RECIPES.

Short-Cake.

I did not "brew or bake forty years ago," but my good, old New-England mother did, and I will give you her rule which I have always followed, for making short-cake. To one quart of flour add three teaspoonfuls of good baking powder and one teaspoonful of salt; mix thoroughly and wet it up with good, sweet cream as soft as you can roll it out—it should be handled as little as possible. If it is to be used without fruit, the dough should be rolled a little more than half an inch thick and cut with a biscuit-cutter and baked in a very hot oven. But for genuine strawberry short-cake, I roll the dough a little thinner and to fit a round, tin pie-plate; place it on the buttered tin and butter the top; place another layer on top of that and bake. The top layer can be lifted off without cutting, to spread the fruit between. L. R. S.

Dusty Carpets.

If those ladies who do not use a carpet-sweeper will sprinkle damp, coarse salt over a dusty carpet first before sweeping, they will find the dust much less annoying. Mrs. D. L. B.

Nunda, N. Y.

Asparagus Salad.

Wash and cut off most of the white part; tie up in a cloth and boil until soft in salted water; take up, remove the cloth, turn over two-thirds of a cupful of good vinegar; sprinkle with pepper and salt and set where it is cold. Before serving arrange the asparagus so the heads all lie in the center of the dish, and mix with the vinegar drained off from it, half a cupful of melted butter, the yelk of two hard-boiled eggs, and a teaspoonful of mustard, and pepper and salt if needed. Pour over the asparagus and serve. The water should be well drained from the asparagus before the vinegar is poured over. This dressing is enough for one good-sized bunch of asparagus.

Salad Dressing.

No. 1.—Stir a teacupful of butter until very light; add to it gradually the beaten yelks of four eggs; mix in a teaspoonful of made mustard, a little pepper and a large teaspoonful of salt; next stir in slowly a teacupful of thick, sweet cream, and last, half a teacupful of clear vinegar—a little more vinegar may be added, if the dressing is not thin enough. Pour over the salad just before it is served.

No. 2.—The yelks of two hard-boiled eggs, rubbed fine and smooth and beaten into the yelks of two raw eggs; a teaspoonful of made mustard, salt and sugar, with a little cayenne pepper; add the freshest olive salad oil, drop by drop, beating the meantime as long as the mixture continues to thicken, and then add vinegar till as thin as desired. Mary B.

Garlic Taste in Butter.

The disagreeable garlic taste in butter, which in spring time in many sections almost spoils butter otherwise good, may be destroyed by putting into the pail, each time before milking, as much pulverized saltpeter as will lie on a five-cent silver piece. Mrs. James Tieman.

QUESTIONS ANSWERED.

Vanilla and Coffee Extracts.

Mrs. J. D., Brooklyn, wishes to know how the above extracts are made.

Ans.—For vanilla: cut one ounce of fresh vanilla beans into thin shavings and triturate with two ounces of loaf sugar; put into a bottle and pour over ten ounces of deodorized alcohol of 95 deg., and four ounces of pure water; cork and set in a warm place for ten or twelve days, shaking occasionally. This makes a very good domestic extract, and answers for all cooking purposes. As for coffee extract, we are sorry to say that although we have diligently tried to find out the process, it seems to be a secret which those possessing it are unwilling to disclose.

To Bleach Wax.

Mrs. R. Lake desires to know how the ordinary yellow beeswax can be made white.

Ans.—Slice the wax into thin flakes and spread on sacking or any coarse cloth stretched on frames resting on posts, or anything to raise them from the ground. Stir the wax frequently, and sprinkle occasionally with soft water. The wax should bleach in from three to four weeks. Should the flakes, upon breaking them, still appear yellow inside, it will be necessary to melt them again, flake and expose as before.

ANSWERS TO CORRESPONDENTS.

(Continued from page 237.)

Grafting Fruit Trees, Etc.

C. T., Millersville, Ohio, asks 1, can Pearl Millet be cut with a machine; 2, full information about grafting fruit trees; 3, does soaking corn in any kind of solution keep the wire-worms and cut-worms from spoiling it; 4, which are best for seed—large or small potatoes.

Ans.—1. No, not if left until it has attained its full growth. 2. There are several methods of grafting fruit trees, which may all be successful if skillfully executed. The method in common use is the so-called cleft or split grafting, which is especially adapted to Pelargoniums and plants known as soft-wooded, but it is altogether too barbarous for fruit trees. What is known as bark grafting is not so violent an operation, and is, if anything, more successful. By this method grafting should be done as soon as the bark is loose. The stocks may be of any size and age, and the cions should be young, vigorous shoots of the previous year's growth. Cut off the stock with a saw from four to ten inches above ground, and at a smooth spot make a longitudinal slit in the bark, from the top of the stock downward about an inch and a half. With the handle of a budding-knife, or with a piece of hard wood similarly shaped and very smooth, loosen the corners of the bark a little at the top. On the bud end of the cion, and diagonally through it, make a clear, smooth cut, about an inch and a half long. In shape the lower end of the cion will thus approach that of a wedge, gradually tapering to a point, and having a clear, flat surface on one side, and the bark on the other. Now shorten it in to two or three vigorous buds, and it is ready. Next insert it under the bark of the stock, in the slit previously made, with the cut surface against the wood of the stock, pressing it down firmly, then wind some yarn about it to hold it in place, and cover the whole with grafting wax to exclude the air. Re-grafting old fruit trees is done in the same manner, but it is not advisable to remove all the branches in one year. Leave two to four, according to the size of the tree, to draw the sap. If it is desirable to graft before the bark can be loosened, or if the young stock is very small, prepare the cion as before, but instead of putting it under the bark, cut away the bark and wood of the stock, with a smooth cut, over an area similar to the cut on the cion. Now tie the cion to the stock, being careful that bark fits to bark, at least on one side, and cover it with grafting wax as before. For full description of grafting, see lengthy illustrated article in Rural of March 15, 1878. 3. A correspondent of the Rural writes us that he has used the following solution with entire satisfaction as a preventive against the wire-worms: 4 ounces of saltpeter, and 4 ounces of copperas dissolved in water. This is enough to soak one bushel of corn. 4. We should prefer medium-sized potatoes for seed. Small potatoes have seldom such vigorous buds as the large ones, and do not give the plants so good a start.

Sick Heifer.

J. W., Smith's Grove, Ky., says: "A heifer was turned out with the herd in the morning apparently well, but came home at night behind the herd, and looking dazed out of her eyes. During the night she lost the use of her limbs and moaned piteously at intervals through her illness—she had a capricious appetite, stools gradually changing from hard to soft and from that to diarrhea with no apparent cause. Her death occurred in eight days after first illness; there was some blood mixed with her last voidings of excrement, and froth about her mouth the morning after she was taken sick. Post-mortem examination showed yellow gall bladder and tallow stained with the same color; lungs were pretty large with dark spots in and on them. Please diagnose the disease.

Ans.—This is one of those cases in which our correspondent has not been sufficiently careful in his enumeration of symptoms and appearances. The frothy mouth, diarrhea, bloody excrement, yellow gall and tallow, and paralysis, point to disease of the digestive organs and liver, but nothing is said of the post-mortem appearance of these organs with the exception of the gall. We are told that the lungs contained dark spots, but we doubt if the essential disturbance was there, as in inflamed lungs, animals retain the use of their limbs and remain standing. A professional man examining such a case, would determine the condition of each set of organs, and very soon decide the nature of the trouble. We are inclined to think it a case of the so-called *wood-evil* or red water of cattle, said to be caused by eating the young shoot of resinous trees or irritating plants. It often occurs in cattle which pasture on rich, wet land, and may be avoided by drainage or by keeping up the animals and feeding on good food till grass has taken a good start in spring.

Wood ashes, Bone-dust, Barnyard Manure.

F. R. C., Wiarton, Canada, asks, 1, how much hard-wood ashes per acre should be applied to small fruits; 2, would it be well, as an application for Strawberries and Raspberries, to plow coarsely ground bone well under, then sow the ashes with some fine bone dust and plow both four inches under, and then sow a little superphosphate to give the plants a start; 3, which will pay better—a good article of ground bone at $25 to $30 per ton, or barnyard manure at 70c. per two-horse load.

Ans.—Ashes may be used in any quantities from 10 to 40 bushels per acre for any crop. Ashes are useful, so far as their potash is concerned, for all crops, and never come amiss. Bone-dust should not be plowed under deeply nor should any manure. It is best to keep all manure near the surface, more especially those that are fine; these should be harrowed in after plowing. Stable manure at 70c. per two-horse load is the cheapest fertilizer to be purchased.

Mozambique Current.

A. P. M., St. Stephens, Ohio, asks 1, which way does the water flow through Mozambique Channel; 2, are there two currents, one upper and one lower, and do they flow in opposite directions; 3, if so, what causes them to do so.

Ans.—1. It is a warm, northeasterly current, following the coast of Africa towards the southwest. 2. There is but one current. The South Equatorial current flows across the Indian Ocean, with the southeast Trade Wind, from Australia to Madagascar, striking this island on the east and northeastern shores. Here it divides into two branches, one following the eastern shore of the island towards the south, the other, flowing by the northern point of Madagascar, is augmented with a branch of the North Equatorial current, and both form the powerful Mozambique current through the channel of the same name. Near the Cape of Good Hope it unites again with the branch that flows east of Madagascar, and finally in about the 40th parallel S. L., it is turned by the cold Antartic Drift current, and influenced by it and the there prevailing southwesterly winds, again flows towards Australia, whence it started. 3. Currents flowing in opposite directions are seldom very strong. The main cause is that the warm water, being lighter, flows away on the surface, while the heavier cold water flows in an under-current to take its place. These may be augmented by the wind and peculiarities in the ocean bed.

Catarrh.

A. S. B., Wythe, Va., asks whether there is any sure cure for nasal catarrh.

Ans.—We cannot say positively that any special mode of treatment will affect a cure in all cases. A friend of ours was sadly afflicted with the ailment, and of all the "sure cures" he tried, the most efficacious consisted of crushed cubeb berries smoked in a pipe. They can be bought at any good druggist's. The best way in all such cases is to consult a physician of established reputation, who will be able to prescribe with a full knowledge of all existing conditions. It is seldom advisable to experiment on one's-self with unknown nostrums without competent advice.

Grain for Orchard, etc.

J. H. S., Shelby Center, N. Y., has seen a Double Furrow Plow in the columns of the Rural a few years ago, and asks where he now can get one. 2. He is thinking of seeding down his apple orchard and would like to know what kind of grass he had better put in.

Ans.—1. Apply to R. H. Allen & Co., 189, 191 Water St., N. Y. 2, put in a mixture of June grass, 5 pounds; Orchard grass, 8 pounds; Perennial rye-grass, 3 pounds; Red top, 3 pounds; White clover, 2; Timothy, 4 pounds.

L. B., Maville, N. Y., asks whether we have tested the new early field corn Queen of the Prairie, which it is claimed is the earliest in cultivation.

Ans.—We have known of this variety for a year or so. We have never tried it. To say that it is the *earliest in cultivation* is to say what is not proven at all.

M. L. R., Morrisonville, N. Y., having found that the Paris-green purchased from local dealers last year was poor stuff, intends clubbing with some of his neighbors in their purchases this year, and asks the name of a reliable dealer.

Ans.—F. W. Devoe & Co., 101 Fulton St., N. Y.

G. W., Bay Shore, L. I., asks where can he get a white Cheshire or Suffolk boar old enough for service.

Ans.—Try W. Atlee Burpee & Co., Philadelphia, Pa., or Thos. Cooper, Coopersbury, Pa., who will give all information.

Breeders of Fine Dairy Stock

Should at once investigate the PERFECT CREAMER advertised in another column. It will enable them to realize the largest possible yield per cow, and thus enhance the value of their stock, as well as increase *the value* of the product.

Makers of Gilt Edge Butter

Or those that desire to become such should use THE PERFECT CREAMER, advertised in another column. Butter made by its use, is always rated Gilt edge, and commands ready sale and an extra price.

The great permanency of Murray & Lanman's Florida Water gives it a wonderful advantage over nearly all other perfumes; days and weeks after its application, the handkerchief or garment exhales a soft, rich fragrance, agreeable, refreshing, and healthful.

Hop Bitters give good digestion, active liver, good circulation and buoyant spirits.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, April 5th, 1879.

BEANS AND PEAS.—With the advance of the season considered, there is a fair trade in mediums. At this time buyers want best grade and prefer to pay highest rates than risk a bargain in irregular parcels. Exports of marrows fair, with larger sales looked for. Red Kidneys are good property; new rates firm; sales small. W. kidney and pea beans quiet, the former too much above marrows for activity. Black drm, with light but useful demand. Green peas higher; quoted at $1.30@1.75. Southern B. K. without special inquiry at $2.50 per 2 bush. bag. Canadian, in bulk and bond, 72@73c. Medium beans, choice, $1.30@1.35; fair to good, $1.15@1.25. Marrow, primo, free on vessels, $1.40; fair to good, $1.20@1.35; pea, $1.30@1.35; white kidney, $1.35@1.60; red, $2.40@2.70; black, $2.10@2.50. California Lima, $4@4.25.

Receipts for week, beans, 3,772 bush.; exports, 1,066 bbls.; do, peas, 5,146 bush.

BEESWAX.—There is a considerable quantity held here on a limit of 25c.; bids do not exceed 24c., and at this lower price small lots have been secured.

BUTTER.—Supplies of new are fortunately light. Buyers will not risk free purchases of white, and if stock can be kept from heaping it is better for producer and seller. Receivers are emphatic in repeating the caution given in our last: the point being to make good quality paramount to every other consideration. By so doing, dairy-folks can play the market for all it is worth; while poor toneless stock has no better chance than common remnants of old—in fact, trashy soft white has not an equal commercial hold with summer or fall yellow; asshippers will use the latter and reject the other at similar figures.

Prices for now are still easy, and likely to be so until growing shades appear—but even then, the outlook does not indicate a much higher lasting top than is now quoted.

Old has sunk into a condition of inertness that will require liberal calls from exporters to revive it. Prices for the bulk of it are out of the question—each owner has a scale of his own, or will make an accommodating one on short notice when an actual buyer appears.

NEW BUTTER.—State pails and half tubs, choice, 19@20c.; good, 16@18c.; Welsh tubs, 15@18c.; very poor, 8@13c.; Western Creamery, extra, 25@26c.; fair to prime, 23@270.; poor, 19@21c.; imitation, 17@21c.

OLD.—Best half tubs, 15@16c.; fair to prime, 12@14c.; dairies, full, 13@14c.; do., firkins, 10@14c.; common State, 14@5c.; fair to best; State creamery, best, 15@17c.; poor, 11@14c.; Western dairy, 15@16c.; factory choice, 13¼@14½c other, 5@10c.; grease, 4@4½c.

Comparative receipts and exports past three years:

	Receipts, pkgs.	Exports, firkins.
June 1, '78 to April 1, '79	1,273,638	266,289
" 1, '77 " " 1, '78	1,056,993	160,670
" 1, '76 " " 1, '77	1,085,238	135,409

Receipts for week, 18,665 pkgs.; exports, 4,620 firkins.

BROOM CORN.—Offerings are small of short brush and broom, and generally supplies not excessive, with prices steady.

Brush and short broom, choice, ₱ lb., 5½@6½c.; do. common to good, 4½@5½c.; hurl, good to choice, 3½@4½c.; do., common to fair, 3@3½c.; red and crooked, 2@3c.

CHEESE.—Exports for the week, 28,125 boxes; this slack movement, a fair stock for this late period, and a loss of quality on a good many parcels through long holding gives so much irregularity, that quotations at present are not definite as us is desired.

Nominal for fancy; 8@8½c. for fine lots; 6½@7½c. for good; 5½@6c. for fair; 2@3½c. for skimmed; 4@6c. for half skimmed. Wisconsin factory, fine and fancy, at 8@8½c.; do. good to prime, at 6½@7½c. Western factory, fine 7@7½c.; good and prime, 5½@6½c.; do. full skimmed, 2@4c.; do. half skimmed, at 3@5c.

Receipts for week, 14,160 boxes.

Liverpool cable, 44s.

Steam to Liverpool, 25@27s. 6d.

COTTON.—There is rarely ever a period, characterized by as much excitement and so sharp an advance in prices, as has prevailed the past week. The position of supplies, the generally confident temper at the South, where prospects of continued light deliveries from the interior, and apprehensions that the dissatisfaction among the laborers there will interfere somewhat with the extent of the new crop, together with the encouragement received through a steady response of the Liverpool market to the situation here, have caused the upward movement. Closing prices are for April, 11.10@11.12c.; May, 11.21@11.22c.; June, 11.35@11.37c.; July 11.48@11.50c.; August, 11.60@11.61c.; September, 11.41@11.43c.; October, 10.96@10.98c.; November, 10.62@10.63c.; December, 10.58@10.60c.

DRIED FRUITS.—Apples have been offered easier, and have had but little attention. Peaches have a good sale and rule firm. Small fruits are slow.

Alden's evaporated apples are at 11½c.; Williams's at 11@11½c.; new process apples at 8½@9½c. State plums, 13½@14c.; Blackberries quoted at 4½c. Peaches—Peeled Georgia, 7@7½c. for poor; 8½@9c. for fair to good; 10c. for prime; choice North Carolina, 12@13c.; good do., 9@10c.; unpeeled halves, 3@3½c. quarters, 2½@3c. Pitted cherries, 20c. Apples—New, 2½@2½c. for southern quarters in bags; 3½@4½c. for prime sliced; do., fair at 3@3½c. State at 4@4½c. for new sliced; and 4@4½c. for quarters; Western at 3½@4c. for new quarters. Raspberries, 25@27.

Exports for week—1,450 bbl. apples.

EGGS.—Receipts for week, 19,900 bbls.; do. last week, 14,200 do. The market has been unsettled, but with Easter week upon us, there has been some reaction in favor of sellers which probably will be supported. Receipts are larger, but the trade does not anticipate an over supply.

Near points, 15c.; State and Penn., 14c.; Western, 13½@14c.; Southern, 13c.; inferior, 12@12½c.; duck, 23@24c. goose, 45@50c.

FLOUR.—Shippers have drawn more freely upon the supplies, and there has been more life to home trade wants, with demands met promptly at barely steady prices. A full quantity of flour goes direct from millers' hands to the other side, and thus through-freight business seems to be gaining steadily.

Latest prices are $3.25@3.60 for inferior to very choice superfine State (fancy lots a shade higher); $3.65@3.90 for very poor to good extra do., odd lots and lines; $3.90@4.25 for good to very choice do.; $3.25@3.60 for inferior to very choice superfine Indiana, Iowa, Michigan, &c.; $3.60@3.90 for very inferior to good shipping extra do., and $3.90@4.25 for good to very choice extra do.; common to about choice white wheat extras, $4.25@5.35; choice to fancy do. at $5.35@6.25; red and amber winter wheat, very inferior to very choice trade and family, at $4.00@5.75 (fancy at higher figures); round hoop Ohio at $3.85@4.25, and trade and family brands of do. at $4.65@5.75, the latter rate for very choice (a few fancy lots held higher); St. Louis, $4.10@5.00 for very inferior to good extra; $5.00@6.00 for good to very choice (with a few very fancy brands up to $6.50@6.75; Minnesota clear, very inferior to very fancy, at $3.65@5.00; few brands going above $4.60; Minnesota clear, very inferior to very fancy, at $3.65@5.00, few brands going above $4.60; Minnesota "straight," very poor to fancy at $4.50@5.00; and patent poor to strictly fancy at $5.25@6.50, few brands going above $7.50; unsound stock at from $2.25@5.00; city mill extra at $4.85@5.20 for West Indies (the latter rate for fancy in new packages); do. for England $3.80@4.00; do. trade and family extras, $5.25@5.25; do. for South America, $5.15@5.65 for fair to very choice; No. 2 at $2.35@3.15 for poor to very choice.

FRESH FRUITS.—There is a steady sale for fine apples; inferior sorts dull, and in many cases at buyers' option. Eastern Baldwins, $1.37@1.50; do. Greens, $1.75@2; State Spitz and Greens, $2@2.10; Baldwins, $1.63@2; russets, $1.62@2. Exports of apples for week, 3,489 bbls. The remaining cranberries are chiefly owned by N. Y. parties, who can afford to quote old figures regardless of light trade. Made bbl., $7@8.50; crate, $2.25@3. About another week will use up the crop of Florida oranges; a few choice half bbl. boxes bring $5.50; corky and dingy qualities, $2@4. Florida strawberries in good supply and cheaper at 50@60c. per quart; Chas. do., 50@60c.; hot-house, $1@1.25. Peanuts quiet, the weather being against retail trade.; Virginia hand-picked, $1.20@1.35; others, 60c.@1.05; shelled, 4½@5c.; pecans, 6@8c.

GRAIN.—Weather reports have exercised a sharp influence upon the grain markets this week, particularly as respects wheat. For a day or two we had reports that the winter wheat crop was being injured, and especially in Kansas, where a severe drought was mentioned; speculators operated with confidence and succeeded in placing prices on a decidedly better basis; then later came reports that the weather was very favorable in most sections, and the market was sent back again. With conflicting statements and a consequent feverish condition of the market exporters do not care to enter into negotiations extensively. Latest sales of wheat are of No. 1 red at $1 15½@1 16; No. 2 red at $1 15@1 15½; No. 3 red at $1 10@1 10½; ungraded red at 96½c.@$1 13½; No. 2 amber at $1 13@1 13½; ungraded amber at $1 12@1 13; white State at $1 14@1 14½; No. 1 white at $1 12½@1 13½; do., steamer grade at $1 11; No. 2 white at $1 11@1 11½; ungraded white at $1 12½@1 13; No. 2 spring at $1 05@1 06; No. 3 spring at 94@95c.; No. 4 spring at 88@90c.; ungraded spring at 85c.@$1 02; rejected spring (to arrive) at 79c.; No. 2 amber, April option, at $1 13½; do., May option, at $1 14½; No. 2 red April option, at $1 15½@1 16; do., May option, at $1 16@1 16½; No. 1 white, April option, at $1 13@1 13½; do., May, reported at $1 14½c. Rye at 58½@59½c. for Western, and 61@62½c. for State. Corn at for New York No. 2 at 45¼@45½c; New York No. 3 at 44½c. for car lots; New York steamer mixed at 45@45½c.; ungraded western mixed at 44@45½c.; steamer yellow at 45½c.; Jersey yellow and southern quoted at 45½46c.; No. 2 white at 48@45½c; yellow western quoted at 45½@46c.; round yellow quoted at 46½@47c; white southern at 50c.; New York No. 2, April option, at 45½@45½c.; New York No. 2, May option, at 46c.; New York No. 2, June option, at 45½c.; steamer mixed, April option, at 44½c.; do., May option, at 44½c. Oats at for New York No. 1 at 32½c.; New York No. 1 white at 35c.; New York No. 2 at 31½c.; New York No. 2 white at 34c.; do., May delivery, at 34c.; New York No. 3 at 31½@31½c; New York No. 3 white at 32½c.; No. 2 Chicago quoted at 32@32½c. afloat.; mixed western at 31@33c.; white western at 34@36½c.; white State at 35@41c. Barley steady; State, 6-rowed, 70@80c.; do., 2-rowed, 55@65c.; Canadian, 80c.@$1 05.

HAY AND STRAW.—Offerings are full, demand fair, and prices sustained.

Sales at 40@45c. for shipping, and 70@75c. for retail qualities. Straw quoted at 40@45c. for long rye, and 35c. for short rye, and oats at 35@45c.

Exports for week—1,372 bales.

MAPLE SUGAR.—With a moderate offering of fine prices are well supported. New State, 12@13c. Ohio, 10@12c.; per ₱. Some State marks have a settled good reputation, and can be placed as readily as Vermont boilings. Vermont small cakes, 14c. per ₱.; old sugar, 6@8c. ₱ ₱.

POULTRY AND GAME.—A light supply of live and an extra demand for Hebrew holidays have put prices where they are; an earlier time expected after Monday. Spring chicks, 62@$1 ₱ pair; N. J. fowls, 15c.; Western, 14@15c.; Southern, 13@14c.; roosters, 7@8c. Turkeys, N. J., 17@18c.; Western, 16@17c. Ducks choice, 95c.@$1; other, 65@75c.; choice geese, $1.75@2; southern and Western, 15c.@$1.37. Pigeons, 35@40c.

Very few lots of fresh killed arrive and prime frozen has the sway of the market, at full late figures. Selected Vermont turkeys, 21c.

Frozen turkeys, choice, 20c.; fair to good, 17@19c.; frozen chickens, 12@13. Dry-picked winter chickens, 27@30c.

Turkeys, best, 18@20c.; the latter for Pa. dry-picked; other, 14@17c.; chickens, best, 20@22c.; other, 14@16c.; fowls, choice, 16@18c.; other, 10@14c.; capons, 23@30c.; slips, 24@25c.; ducks, best, 17@20c.; other, 15@18c.

There is a fair call for game, but it wants fine quality. Pigeons scarce. Southern snipe do not bring more than half price. English snipe, $1.12@1.25 ₱ doz.; plover, $1@1.25; small snipe, 40@50c. W. pigeons, $.25@1.37; canvas backs, 75c.@$1; red head, 50@60c.; mallard, 30@40c.; black, 30@35c.; common, 10@20c.

PROVISIONS—Have been very slow and without important change. Mess pork closed at $10.60 bid and $10.70 asked for new for April, and May at $10.65 bid and 10.75 asked, and June at $10.70 bid and $10.80 asked, and July at $10.70 bid and $10.80 asked. Bacon at 5¾c. for long clear and 5 7-16c. for short clear. Lard at $6.60 for new lots; $6.57½ for April; $6.62½ for May; and $6.70 for June. Stearine at 6¾c. for Western. Tallow at 6 9-16c. for prime. Beef hams at $18@18.25. Beef—Extra India mess, $10@21, as to quality; packet, $11@11.50; plain mess, $9.50@10.25; extra mess at $10.50@11.50.

VEGETABLES.—Exports potatoes, past week, 577 bbls. Choice potatoes continue firm, but with the ends of lots a good many small Early Rose are turning out. Seed demand fair; sweet potatoes higher. Contributions of early produce from the South are steadily increasing, and where prices are quoted up to previous rates quality is in favor of the buyer. California asparagus is quoted at 20c. per ₱.

Bermuda onions, $6@6 crate; do., beets, $1.50@1.75 crate. Charleston asparagus, $7@7.50 doz.; Florida green peas, crate, $1@1 50; rad., do., $3@4 50; Virginia kale, 75@$1 ₱ bbl.; do. spinach, $2@3 Baltimore. do., $1 50@$2. Virginia radishes, $3 ₱ 100 bunches. Hot-house rhubarb, ₱ 100, $4@7; radishes, $3@4; cucumbers, $2@2.50 ₱ doz.; mushrooms, ₱ ₱., 50c.; lettuce, selected, 25@75c. ₱ dozen. Bermuda potatoes, choice, $9 00 per ; bbl.; Early Rose, Nova Scotia, $3 00@3.25; Eastern, $3@3.25; State, choice, at $2.50@2.75; fair to good, $2@2.75; Peach Blow, white, in bulk, $2.50@3; red, $2.25@2.75; Prolific, $2.25@2.75; Peerless, State, $1.75@2; in bulk, $2@2.13; Jackson white, $2@2.37; Mercer, $2.25@2.37; (outside rate per double heads). Sweet potatoes, Md. & Del., $3.50@3.75. Bermuda tomatoes, 90c.@$1 box. Onions, Eastern, white, ₱ bbl., $4@6; red and yellow, $4@5; Chester, $4@4.50. Squash, Hubbard, $3@3.50; marrow, $3. Cabbages per 100, $4@8; R. turnips, per bbl., $1@1.25; beets, 75c.@$1.00; carrots, $1@1.12.

SEEDS.—Clover is easy, quoted at 6@6¼c. for prime and 6¾c. for choice. Timothy at $1 30@1 40.

TOBACCO.—Demand is slack, the export urges for meagre amounts and home trade light.

WOOL.—With the close approach to the new clips of Texas and California and the slow goods market trade has been very light, and prices unsettled.

Ohio, Pennsylvania and Virginia—XXX and picklock, 36@37½c.; XX, 33@35c.; X, 31@34c.; No. 1, 33@35c.; No. 2, 31@33c.; common, 28@30c.; combing, 34@36c.

New York, Michigan, Indiana and Wisconsin—XX, 30@33c.; X, 29@31c.; No. 1, 31@33c.; No. 2, 27@30c.; common, 26@28c.; combing and delaine, 33@37c.

Iowa, Vermont and Illinois—X and XX, 28@30c.; No. 1, 30@33c.; No. 2, 27@28c.; combing, 33@36c.

Missouri, Kentucky and Tennessee—Washed fleece, 30@33c.; unwashed fleece, 18@24c.; unwashed combing, 22@25c.

LIVE STOCK MARKETS

Saturday, April 5, 1879.

BEEVES.—Receipts for the week, 9,751 head; do., last week, 9,390 do. The market has ruled rather tame. In early sales at the close prices were ¼c. better than on Wednesday, but even this moderate advance was soon lost. Quality of cattle even nothing very common or very choice. Ordinary to prime steers ranged at 9c., to dress 55 lbs, to 10¾c. to dress 57 lbs. Most sales at 9¼@10¼c.

Exports for week, 7,700 quarters.

COWS AND CALVES.—The demand is very limited, and the nominal range is lower for ordinary to good cows; $30 to $50 per head are now full rates.

VEAL CALVES.—Supplies are large, prices lower and weak. Prime N. J., live, 6c.; best State, 5½c.; others, 3½@5c.; very poor, 2@3c. State calves run poor. Hog-dressed calves have declined fully 1c. on choice. Extras this afternoon, 7c.; fair to prime, 5@6c.; poor, 3@3½c.

SHEEP AND LAMBS.—Receipts for week, 18,064 head; do. last week, 18,416 do. The receipts of sheep exceed the wants of trade as the market is so generally well stocked with meats. Decent to prime sheep sold yesterday at 5¾@6¾c.; yearling lambs b ought 7c@7½c. Trade drags at these prices at the close. Prime to choice lambs, $4.50@5.50 per head.; poor, $2.00@3.50.

SWINE.—Receipts for the week, 31,678 head; do. last week, 25,757 do. Supplies go mostly direct to killers; a few sales are noted at $4.10@4.30 per 100 lbs. Country dressed pork, light, 6¼@6½c.; medium, 5¾@6c.; heavy, 5½@5½c.; city dressed, 5½@5½c. Pork tenderloins, 9c.

SPECIAL NOTICES.

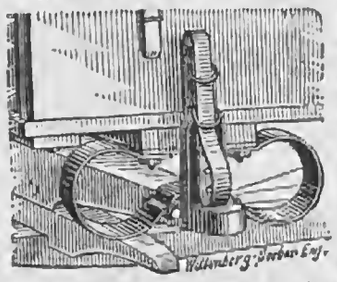
SOMETHING NEW!
Pulliam's Patent Bolster Springs
FOR FARM AND FREIGHT WAGONS.



They are for wagons hauling from 1,000 to 3,500 lbs. Made of the finest tempered steel and warranted. Attached by bolts through the bed. Can be put on any wagon by any person. Remain on the wagon for all uses and work equally well empty or loaded. Spring seat not needed. Transforms a farm wagon to a comfortable Spring Wagon. *Great for hauling fruit and bully for going to church.* Equally comfortable for one or twenty persons. A fast selling thing for Agents. We want Agents in every county. Send Postal for terms. Circulars free. Ask your hardware dealer for them, or address **Semple & Birge Mfg. Co., St. Louis, Mo.**

State you saw this in the Rural New-Yorker.

HORSFORD'S Bread Preparation
UNSURPASSED FOR MAKING
LIGHT BREAD,
Biscuit, Rolls, Cake and Pastry.

It is Better and Healthier than ordinary Baking Powder, Cream Tartar or Yeast.

The cost of raising Bread, Biscuit, &c., with it is only about half as much as by ordinary Baking Powder, and the result is much better.

It restores the nutritious elements which are taken from the flour in bolting. No ordinary Baking Powder or anything else used for raising bread does this.

Universally used and recommended by prominent Physicians.

If you cannot get it of your Grocer send a three-cent stamp to the manufacturers for a sample.
Manufactured according to the directions of Prof E. N. Horsford, by the Rumford Chemical Works Providence R. I.

A GREAT OFFER!!! 100 PIANOS AND ORGANS at EXTRAORDINARY LOW prices for cash. SPLENDID ORGANS $35, $40; 5 Stops $45, 7 do $50, 9 do $55 & $60, 11 do $65, 12 do $70, 13 do $80. 7 Octave SQUARE AND UPRIGHT PIANOS $125 do $130, 71-3 do $140, not used SIX Months. Warranted 5 years. AGENTS WANTED. Illustrated Catalogues Mailed. Music 1c. per page. HORACE WATERS & SONS, Manufacturers and Dealers, 40 East 14th., Street, New York.

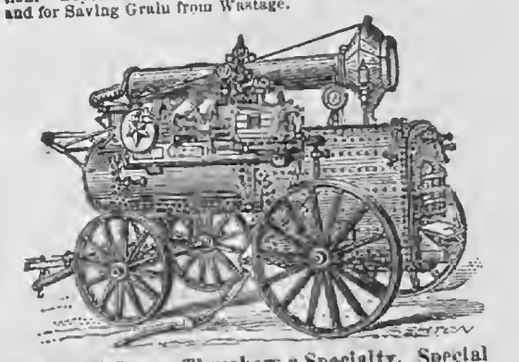
ORIGINAL AND ONLY GENUINE
"VIBRATOR"
THRESHING MACHINERY.

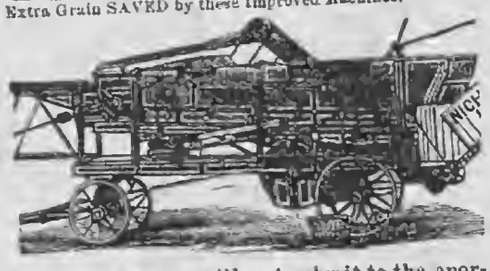
THE Matchless Grain-Saving, Time-Saving, and Money-Saving Threshers of this day and generation. Beyond all rivalry for Rapid Work, Perfect Cleaning, and for Saving Grain from Wastage.



STEAM Power Threshers a Specialty. Special sizes of Separators made expressly for Steam Power.

OUR Unrivaled Steam Thresher Engines, both Portable and Traction, with Valuable Improvements, far beyond any other make or kind.

THE ENTIRE Threshing Expenses (and often three to five times that amount) can be made by the Extra Grain SAVED by these Improved Machines.



GRAIN Raisers will not submit to the enormous wastage of Grain and the inferior work done by all other machines, when once posted on the difference.

NOT Only Vastly Superior for Wheat, Oats, Barley, Rye, and like Grains, but the ONLY Successful Thresher in Flax, Timothy, Millet, Clover, and like Seeds. Requires no "attachments" or "rebuilding" to change from Grain to Seeds.

MARVELOUS for Simplicity of Parts, using less than one-half the usual Belts and Gears. Makes Clean Work, with no Litterings or Scatterings.

FOUR Sizes of Separators Made, Ranging from Six to Twelve-Horse size, and two styles of Mounted Horse Powers to match.

IN Thorough Workmanship, Elegant Finish, Perfection of Parts, Completeness of Equipment, etc., our "VIBRATOR" Thresher Outfits are Incomparable.

FOR Particulars, Call on our Dealers or write to us for Illustrated Circular, which we mail free.

Reading for the Young.

TO THE SONS OF THE FARMER.—No. 5.

REV. A. W. MANGUM.

BELIEVING that, under proper influences and favorable circumstances, a young man will be led to the calling to which his tastes and talents are adapted and which it is his duty to follow, I still deem it important to point out the danger of disastrous mistakes in making the momentous decision. Sheer accidents and extraneous considerations will sometimes exert more power over the mind than will the most essential and appropriate facts and principles. Family pride, governed by false notions of what constitutes higher respectability, will urge the eager, anxious youth to enter a field of enterprise that promises special distinction before the public. Hence many young men are in professions to which they are, in every respect, unsuited; and, consequently, they do not and cannot excel. Some desire to be and to do what they admire in some successful persons; and misconceive the nature of their desire, believing it to be an indication of their taste and special endowment. They do not remember that merely to enjoy music is no evidence of capacity to become a skillful musician; or that pleasing astonishment at the feats of an athlete is no indication of the ability to rival his performances. Habits of indolence often exert a sad control over the inclinations and efforts of the young. He who cultivates an indisposition to any severe exercise of his powers, physical or mental, need not expect to find the right sphere in life or to accomplish success for himself or benefits for others. Many a young man lies down in idleness under the deep shades of obscurity, and slumbers away the priceless hours of promise and opportunity, almost in sight of the blooming fields of grand achievement, in which the buoyant toilers of various degrees of talent are sowing the seeds of perennial hope and reaping the golden harvests of rapturous triumph. Unworthy dreams of vain and unprofitable pleasures too often seduce the sensuous nature of youth into paths of pitiful folly, leading to failure and disappointment. Let the young man consider what it is, in his nature, that peculiarly inclines him to any special course in life. If it be his lower appetites, his misguided or inordinate passions, or any of the dictates of ignoble selfishness, he must know, on second thought, that he dare not yield to such a propensity.

The young American of to-day is too apt to form his life-plans under the impulse of that uncalculating, sanguine eagerness which characterizes the age. He is impatient under the slow though surer and more healthful progress of those departments of labor and enterprise that requir time for their development. Youth generally, and especially in this day, needs to learn the royal lesson, "to labor and to wait." Adventurous speculation is always a hazardous policy and always liable to result in ruinous losses and disappointments. It is most to be deplored when it rules in the choice of a vocation that is to be pursued and depended upon, for support and success, through the varying fortunes of life and the inconstancy and irregularity of the many interests that, in divers respects, affect individual prosperity. Hence one should choose a calling that promises to be fruitful and worthy of pursuit through all ordinary changes.

Some are too much affected by a desire for novelty. The plain, familiar objects and scenes of home lose their power to please the deluded mind, and are regarded inferior to those that exert a charm simply because unknown. All change is not improvement. "All is not gold, that glitters." "Things are not what they seem." Those who act hastily under the dazzling influence of mere appearance, often have great cause to mourn over their folly with bitter regret and self-reproach. Many are moved to the formation of purposes by the glowing opinions which others (really as little informed as themselves) express about certain occupations and opportunities for profit or promotion. Some are led astray by the unscrupulous and designing; and learn, only when it is too late, that this world has many counsellors and pretended friends that one cannot safely trust. Now, every person is endowed with the power of self-persuasion. It is dangerously easy to find pretexts for doing what one really desires to do. When the heart is under the influence of vehement appetency, the will is liable to be prompted to turn the intellect to the work of justifying the gratification of the pressing passions. How true it is that "the wish is often father to the thought!" It is a matter of the highest importance to "be sure you are right" before you "go ahead." It is bad to be deceived by others; it is most censurable of all to be self-deceived. Such folly becomes most grievous when it goes to the extent of perpetrating violence upon truth and conscience, and dares to make that which is hurtful to self or others pass for the choice not of rational judgment only, but of the moral mentor likewise. Such a course is a shocking calumny upon Him on whom man depends for all blessing. In deciding upon your life-work, it is difficult, but it is profitable, (and it certainly is your duty) to divest yourself of all unwarranted inclination and prejudices, and to be sure that your determination is fixed by considerations worthy of a being gifted with reason and conscience, and placed under the tremendous responsibility of self-care and self-direction.

An occupation is not to be chosen because it is thought to promise extraordinary reputation and public consequence; neither is it to be shunned because it is commonly associated with retirement and comparative obscurity. Distinguished public men are not always the most contented or the most useful; while those who choose the quiet walks of humble industrial pursuits frequently escape many of the sorest vexations and disappointments of life, realize the fulfillment of many of the brightest dreams of youth, and achieve a truly enviable name as patriotic citizens and noble Christian philanthropists.

To be sure that you are right, "Acknowledge *Him* in all thy ways and He will direct thy paths."

THE HORTICULTURAL CLUB.

So far, the organization of the club has been a success. Many of the cousins have sent in their names and stated their determination to have gardens of their own. Some have also related their experience in gardening in previous years, and, from the way they have managed to succeed, I feel assured that no such word as fail is known to them. But the club is still in its infancy, and not nearly as many have joined yet, as I think will be benefited by joining. It must be borne in mind that such a society cannot have too many members. A thousand names might be added to the list, and still leave room for other thousands. The more members the club has the more interesting it will be.

Those who have already joined have, I doubt not, begun operations in their gardens, and all who desire to join should begin at once. As I have previously mentioned, it is best to begin with a small garden. A piece of land fifteen or twenty feet long, by the same number of feet wide, is abundantly large enough to begin with. Later, if any one should feel able to cultivate a larger garden, it can easily be extended. It is better to begin in a small way and grow in the business, than to start on a magnificent scale only to discover that the enterprise surpasses one's powers. Of course, I am now talking of those only, who have gardens for pleasure. If any boy lives near a town, and he intends to raise vegetables and small fruits, as, for instance, onions, celery and strawberries, to sell in the market, then he cannot expect to do all the work himself, and his garden may be as large as he can cultivate.

If you have a choice as to situation, choose your land in a corner of a field or garden, so that it will not be in the way of the plow and harrow; it should also be a corner that the chickens do not frequent. Give the land a good coat of manure, spade it in, and level the ground nicely with a rake. Digging is hard work, but the soil is pulverized much better with a spade than with a plow, and then, how sweetly one sleeps after a day's hard work with the spade. It is best not to spade more than is seeded down at once; if spaded several days ahead the surface dries and the seed does not germinate so readily.

In the selection of vegetables to plant, one must, of course, be governed by his tastes. Plant cabbage, cauliflower, celery, potatoes, melons, carrots or whatever you are fond of. Among the varieties that should be sown as soon as the ground is fit to work, are onions, early peas, radishes, spinach and a little later, lettuce. Do not bury the seed too deeply. A good rule for the smaller seeds, is to cover them with a layer of soil, about twice their own thickness, but the larger seeds, such as peas and beans, may be covered with an inch and a half to two inches of soil. I will give you some more hints next time.

UNCLE MARK.

DREAM OF FAIR WOMEN.

BY MRS. H. G. ROWE.

"I'VE read the poem over and over again, but I never really understood who all the characters were after all. Now who is this first one,—this

'Daughter of the gods, divinely tall
And most divinely fair'?"

"Why, that was Bert Stacy I I should 'a' thought you'd known *her*."

Auntie, Madge, even Will, laughed outright, much to literal Bess's bewilderment.

"I did'nt mean who took the character last night, but who the character really is," explained Madge, with a glance at her aunt's interested face.

As you may already have guessed, Bangor had been holding a "Carnival of Authors," and like many others, Madge had been delighted, interested, and in many cases puzzled to locate many of the quaintly costumed characters.

"Do explain this one poem, auntie," she pleaded. "I hate to be ignorant about such things that everybody is expected to understand."

Aunt Lou took the little blue and gilt "Tennyson" in her hand, and read again the lines that Madge had indicated:

"A daughter of the gods, divinely tall,
And most divinely fair."

"That refers to Helen, wife of the Greek king Menelaus, who was tempted by Paris the son of King Priam of Troy to forsake her husband and country for his sake. There is a pretty legend connected with this affair, that Madge must tell us, for I know that she has read it in her Grecian mythology.

Madge blushed a little as she asked timidly, "Do you mean the story of the 'Golden Apple,' auntie?"

"Yes, please tell us about it."

And Madge, with a glance at Will's quizzical face, complied:

"Why, the story is, that once upon a time the gods and goddesses gave a party, and some disagreeable neighbor who didn't get an invitation thought she'd spite 'em by getting up a contention among them. So she threw a golden apple into their midst, and the three principal goddesses, Juno, Minerva and Venus, all claimed it, and the consequence was a dreadful squabble in which everybody took sides, and got as mad as they could be about it. But at last they agreed to leave it to Prince Paris, of Troy to decide; and Juno promised him power and riches if he would give it to her; Minerva wisdom and skill in arms; and Venus, the most beautiful woman in the world for a wife. So he gave the apple to her, and she sent him to the court of King Menelaus to win the love of his beautiful queen."

"What a flat he must 'a' been!" sneered Will, contemptuously, while auntie, taking up the broken threads of her own story, went on:

"The wronged king called to his aid all the other Grecian kings, and a great army was raised, with his brother Agamemnon as general-in-chief to proceed against Troy, chastise the seducer, and bring back the missing beauty."

"What did they want her back again for?" interrupted Bess.

"I'm sure I don't know. But at any rate it was considered cause enough for a war, and on the strength of it, the allied Greeks besieged Troy for twenty years; and at length, despairing of success, they resorted to the famous strategem of the "wooden horse;" you must tell us about that, Will."

Will was interested enough by this time. "Why, you see, they made a whopper of a horse out of wood, and hollow inside, and offered it to the Trojans as a present. They must 'a' been an awful green lot not to see that something was up, but they didn't, and were tickled half to death to get it, and dragged it into the city and set it up in the market-place for all the people to look at. But when it came night, and everybody was asleep, the Greek soldiers that had been hidden inside the horse crept out and opened the gates of the city to their friends outside—so the Grecians rushed in, and sacked and burned the city."

"No wonder," said Madge, "that she is represented as saying—

'Where'er I came, I brought calamity.'

But who is the next one, who accuses Helen of being the cause of some great misfortune to her?"

"That is Iphigenia, the daughter of Agememnon, who was sacrificed to avert the wrath of the goddess Diana. Agamemnon, as the story goes, gave at one time great offence to the goddess, and to propitiate her he vowed to sacrifice the most beautiful thing born within the year. It chanced that this was his only daughter Iphigenia. Naturally, the father delayed to perform his horrible vow, but when, on their Trojan expedition, the whole Grecian fleet lay becalmed for weeks, the seer Calchas declared that it was in consequence of Diana's anger against Agememnon, and that Iphigenia, now a beautiful maiden, must be sacrificed immediately.

"The allies—the stern, black-bearded kings with wolfish eyes—concurred in this decision; and the ill-fated maiden was placed upon the altar, when suddenly she disappeared, and a snow-white hind lay bound in her stead. Diana, moved with compassion, had transported her to Tauris, to serve as a priestess in her temple."

"That's a kind of Abrahnm and Isaac story," remarked Bess, but nobody noticed her, for Madge exclaimed triumphantly,—"I know without telling who this means:

'A queen with swarthy cheeks and bold, black eyes,
Brow-bound with burning gold.'

That's Cleopatra, of *course*."

"Right, Madge! This is certainly that same Egyptian queen,—that 'serpent of old Nile,' as Shakespeare calls her; a cruel, wanton, wicked woman, in spite of all the glamour that romance and poetry have contrived to throw about her. Egypt during her reign was under the control of the Romans, and after the death of Julius Cæsar, Antony, Octavius and Lepidus determined to divide the empire between them. Taking the East as his share, Antony established himself at Alexandria, and summoned the Egyptian queen to his presence. She came, sailing up the river Cydnus, with the greatest magnificence and pomp of barbaric royalty. Her barge, with its purple sails and golden prow, was a miracle of richness and beauty; while her attendants were dressed to represent nereids, or mermaids, and beautiful little boys representing Cupids fanned and hovered about her as she reclined upon her perfumed silken cushions. As to herself, we may rest content, I think, with Shakespeare's charming description:

"For her own person,
It beggar'd all description: she did lie
In her pavillion (cloth of gold, of tissue,)
O'er picturing that Venus, where we see
The fancy outwork nature."

Antony was so completely enamored with the voluptuous queen that he divorced his own wife,—who being the sister of Octavius, brought the enmity of the powerful Cæsar upon him,—married the Egyptian, bestowing Roman provinces upon her, and acting like a demented man generally.

"In spite of his infatuation, he seems to have feared as well as loved her, for it is told that, on one occasion at a banquet, he refused to taste certain dishes, believing she had arranged to poison him in them. She took no notice of his abstinence, but as the feast went on, she snatched, in mischievous glee, the garland of roses from her head, and shaking some of the petals into her goblet of wine, challenged her guests to do the same. Of course every one obeyed, Antony among the rest, but just as he was raising the glass to his lips, she stopped him, and ordered a slave who waited at table to drain the cup instead. He did so, and fell down dead in an instant; the flowers contained a subtle and deadly poison. In this way the wily queen signified to him that it was useless for him to think that he owed his safety to anything but her love for him."

"I'd 'a' bounced her, an' made tracks for Rome mighty sudden," remarked Will, in his choicest school-boy slang, while Madge asked eagerly,—

"Who comes next, Aunt Lou?"—[To be continued.

CHILDREN'S RUGS.

I LATELY saw a pretty rug, made by a ten-year-old girl, of pieces of cloth an inch square, from old cast-off garments. These pieces she slipped closely on a twine string with a coarse needle, arranging them with several inches of light or mixed colors, with as much of dark, with bright colors in the center of the dark. These were then wound in a circular form and sewed firmly on a piece of coarse cloth. It is better to line the rug with straw matting, or similar material, to keep it in place. These rugs are quite durable and much prettier than some that I have seen made by older and wiser folks. Besides the children are pleased and amused while making them. Even the little boys are delighted to help. JULIA M. W.

Sabbath Reading.

RECLAIMED.

BY S. B. LEVERICH.

ONE day, my conscience smiting me,
I said, "O Lord, I'll follow thee."

But hearts are changeful, and God knows
How oft our love the feebler grows
Through years with blessings filled;
And so one day, it must be told,
I found my heart grown strangely cold,
With gratitude unthrilled.

One midnight, while the household slept,
A shadow o'er the threshold crept,
And settled in the gloom
Above the couch where dainty form
Of baby May, our latest born,
Lay sleeping in the room.

And on my heart a terror lay,—
Was it a dream, or would the day
Make true what I would doubt?—
The morn that brought the sunshine in
Cheered not the room where death had been
And taken sunshine out.

With aching heart and weary tread
I turn from ways which late have led
My feet in paths of pain;
Nor count such grief too hard to bear,
If born of it shall be this prayer
That makes me Christ's again.

To-night I cry, "Christ helping me,
Dear Lord, for aye I'll follow thee."

CONDESCENSION OF CHRIST.

In the plenitude of his grace, the Redeemer stands knocking at our out door, making choice of our sinful hearts as the banqueting hall in which he will preside and feast with us. That he should propose to "sup with us," seems even more wonderful that we should be invited to "sup with him." That he should so condescend to share our poor provision, our imperfect sorrows for the past, our faint aspirations after higher things, our faltering prayers and promises, our poor and sin-stained services, so as to find joy and complacency in these, this is a measure of grace, the riches of which surpass all our comprehension. And, for him who so "overcometh" the deadly fascination of sin and Satan, as to embrace the divine offer, what dignity, what glory in the promise, "he shall sit with me in my throne!" What felicity can be more exalted, than that assigned to the once "wretched and miserable and poor and blind and naked," the deeply erring, but now believing and contrite soul?"—*Rev. J. W. Finlay.*

THE TIGER IN THE SOUL.

A GENTLEMAN in India once raised a tiger cub. His kindness seem to eradicate the ferocity of its nature, and it grew up as a pet. One day its owner, being alone with it in his library, caressed it, and gave it his hand to lick. The rough tongue of the animal grazed his skin and gave it its first taste for blood. Then its ferocious nature awoke. Fury gleamed from its eyes, and crouching, it made ready to spring upon its master. Fortunately, the gentleman had a loaded pistol on his table, and saved his life by shooting his former pet.

Human nature is fallen and the propensity to sin is lurking in every human soul. It may appear at times to be dead, or dormant, or not to exist, but in the moment of temptation, unless the grace of God interpose, it will spring into life, and woe be to the soul in which the evil nature is not kept down by the almighty hand of God. A new heart and constant Divine restraint is the only hope.

PERSONAL ITEMS.

The Pope has sent $1,000 in aid of the sufferers from the inundation at Szegedin.

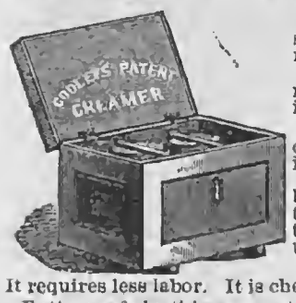
Gen. Moulin, who ordered his band not to play the "Marseillaise" during a review by Gen. Lefebvre, has been placed under arrest, and it is supposed that the French Minister of War will suspend him.

The German emperor is exceedingly popular at present. He can hardly enter any theatre without the audience rising to their feet to hurrah and chant the national hymn. His affectionate subjects have been so inundating the palace with gifts that he has been at last forced to remind the public of a half-forgotten order in Council, forbidding the presentation of books, music, objects of art and industry, etc., without leave being previously asked for and obtained. The only outward signs retained by the Emperor of the two murderous attacks made upon him are a certain paleness, and a scarcely noticeable sling by which his right arm is supported.

Drowsiness, billiousness, pains and aches, and ague, Hop Bitters always cures.

Implements and Machinery.

COOLEY CREAMER



Supersedes large and small pans for setting milk.

It requires no milk room. It requires capacity for one milking only.

Impure air, dust or flies cannot reach milk set in it.

It makes more butter, because it raises all of the cream, and the quantity is never lessened by unfavorable weather.

It makes better butter. It requires less labor. It is cheaper.

Butter made by this process took the HIGHEST AWARD at the INTERNATIONAL DAIRY FAIR—and brings the highest price in all the great markets.

WIT AND HUMOR.

THIS is the walking year; the next will be leap year.

SHAKESPEARE'S conundrum, "What's in a name?" is answered by the Syracuse Times: "If it is a Russian general's name the whole alphabet is in it."

Everything Goes Wrong

In the bodily mechanism when the liver gets out of order. Constipation, dyspepsia, contamination of the blood, imperfect assimilation are certain to ensue. But it is easy to prevent these consequences, and remove their cause, by a course of Hostetter's Stomach Bitters, which stimulates the biliary organ and regulates its action. The direct result is a disappearance of the pains beneath the ribs and through the shoulder blade, the nausea, headaches, yellowness of the skin, furred look of the tongue, and sour odor of the breath, which characterize liver complaint. Sound digestion and a regular habit of body are blessings also secured by the use of this celebrated restorative of health, which imparts a degree of vigor to the body which is its best guaratee of safety from malarial epidemics. Nerve weakness and over-tension are relieved by it, and it improves both appetite and sleep.

The Perfect Creamer is a great success. It excels all other systems in quantity and perfect quality of butter made from a given quantity of milk. The increase in value of product will pay for it in one season. See adv. in another place.

The best method of setting milk is by use of the PERFECT CREAMER OR BUREAU MILK PANS. It maintains a uniform temperature at all seasons, excludes flies and dust, uses but a very small quantity of ice. Is the most economical in time, labor, and money of any system ever devised.

"OUR FAILURES."

Husband.—"I say Lizzie, what on earth did you make this mint-sauce of?"
Young Wife—(who has been "helping" Cook). "Parsley, to be sure!"

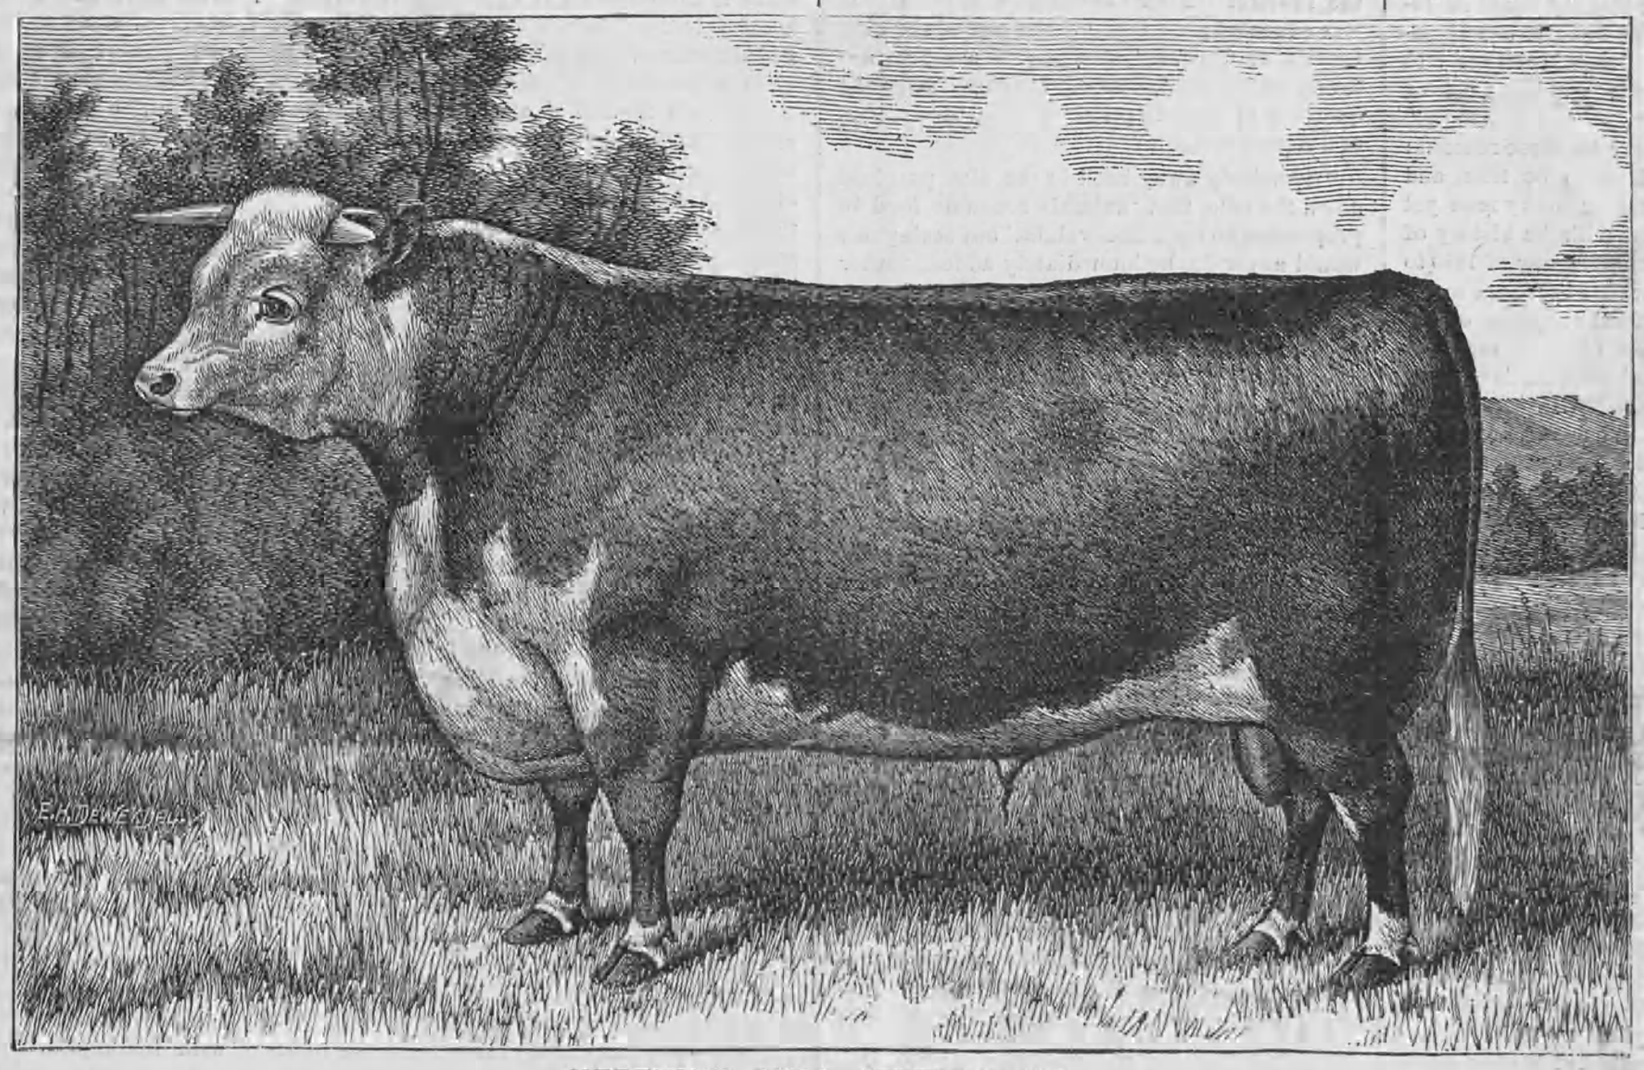
The Herdsman.

OUR ANIMAL PORTRAITS.

In the issue before last we presented to our readers an illustration of the Hereford cow, Empress, a trans-Atlantic celebrity; this week we give them a couple of excellent likenesses of the Hereford bulls, Success and Seventy-six, fine specimens of the cis-Atlantic branch of the breed. The portrait of the former was taken when he was six years old, and that of the latter when he was two years old.

Success has been at the head of the Hereford herd belonging to T. L. Miller of Beecher, Ill., for the last five years; Seventy-six follows him on his heifers. Mr. Miller, we learn, has been very successful with the Herefords and has now a herd of nearly 300 head of thoroughbreds, 150 of which are females. He writes us that he has bred during the past year 150 head of thoroughbred calves. The rapidly growing popularity of this breed, especially in the great beef-producing regions of the West, has led us to place before our readers, in the following article, what one of the most prominent breeders of that strain in the country, has to say in their behalf.



HEREFORD BULL, SEVENTY-SIX.

HEREFORD CATTLE.

In speaking for the Herefords, I would say that as dairy cows they stand well, giving rich milk; but crossing them upon native cows produces a better dairy cow than the thoroughbred. There are records of their dairy qualities, that give them a standing among the best of dairy stock.

But it is as a beef breed that they stand preeminently above all other breeds. Considered as to their market value, they always bring the top price. Considered as to their grazing qualities, they are clearly the best grazers—the best grass animals in the world. Considered as to their feeding qualities, on high feed they will give larger returns than any other breed for the amount of feed consumed. Their competitors are the Short-horns, Scotch and Devons.

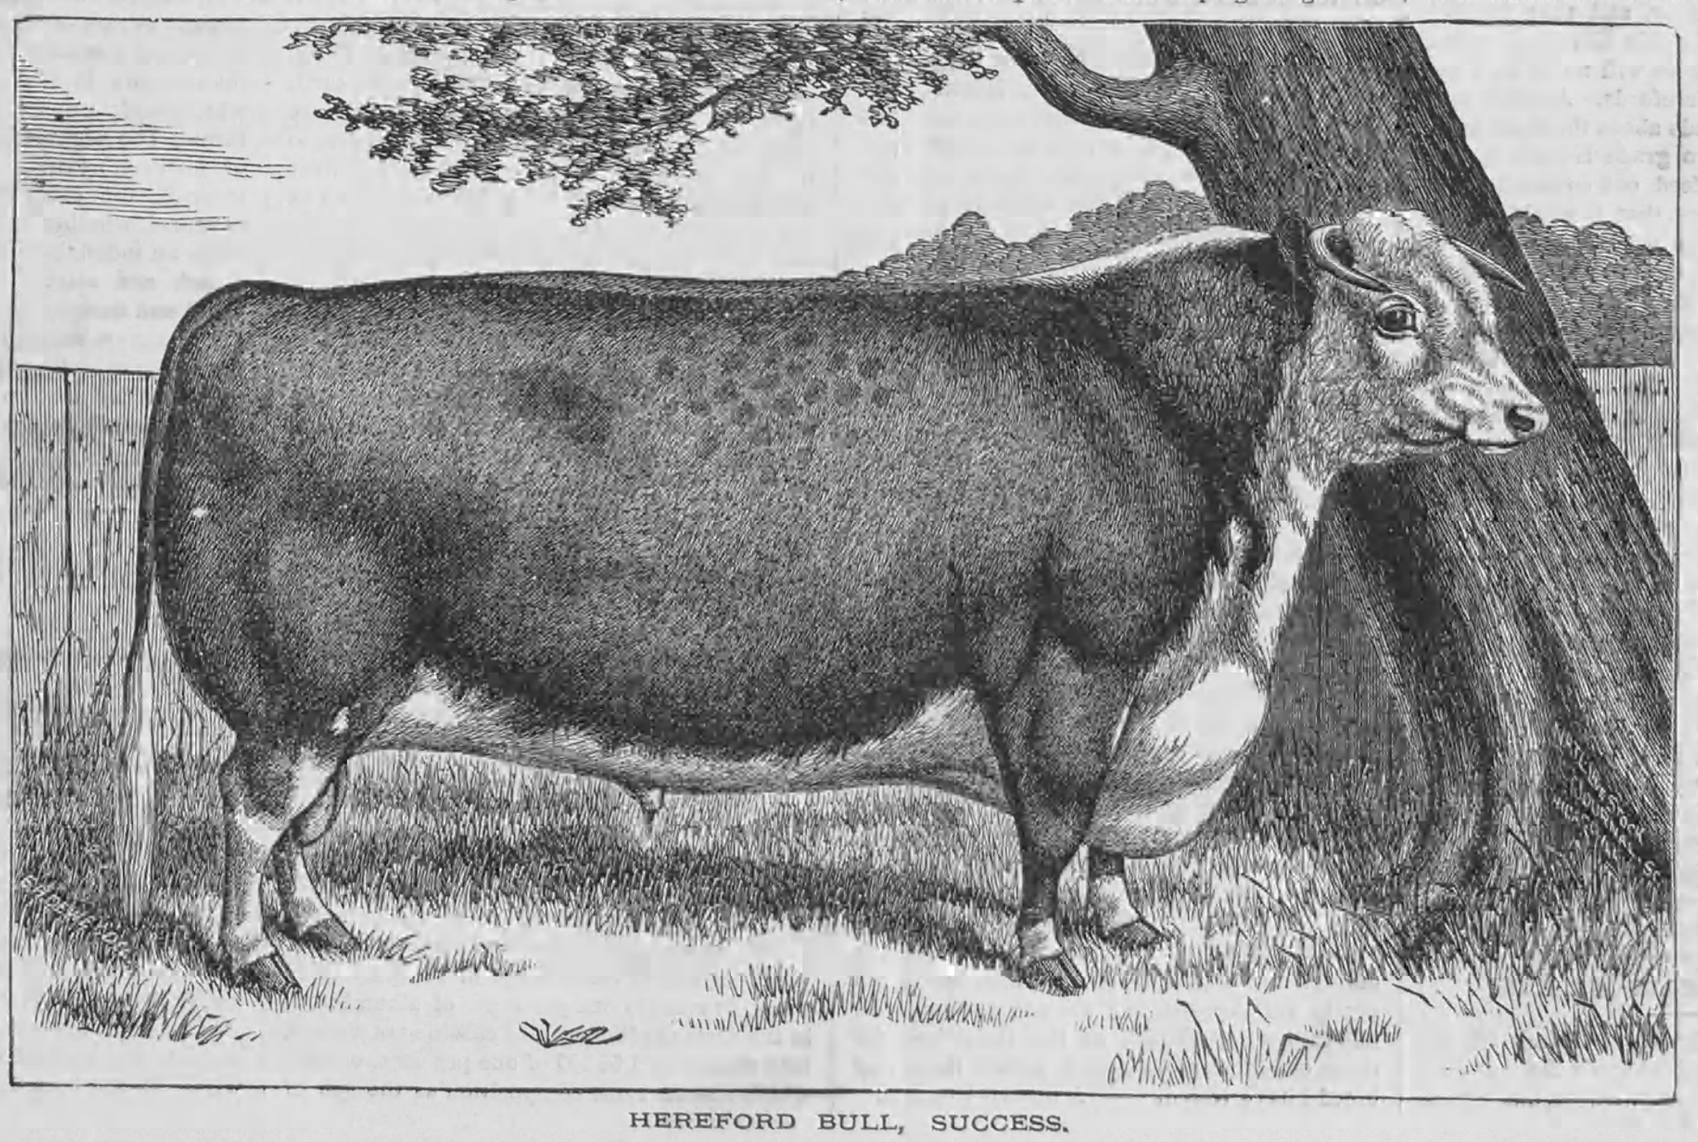
The Short-horns will mature as early; they will make equal weights, but to secure early maturity and equal weights, *they will require from 10 to 25 per cent. more feed, whether of grain or grass*, and the carcass is never worth as much per pound by 5 to 10 per cent. The Scotch and Devons will not mature as well at three years as the Herefords will at two, or at four years, as the Herefords at three years. The Scotch and Devons, when matured, are of good quality, and will command on the market an equal price with the Herefords. It is possible that from the stall they will command a shade better price; but from the pasture the Hereford has no equal.

I believe that this is a fair statement of the standing of these four classes of cattle. This standing has been maintained for 100 years. And still in America the progress of the Hereford has been slow; he has been overshadowed by the Short-horn. About the beginning of the present century the Herefords were selling in England as butchers' beasts for often as high as $500 for a single animal, and at the Smithfield show, in London, they commanded for several years the leading premiums, and always the best market price. I am hoping to get the data by which I may discover the process by which the Short-horns have secured their more general adoption in England and America. I have secured this data to some extent for this country; but this is not conclusive, as their popularity had, to some extent, begun in England before it appeared here.

In the year 1840 the first large importation of Herefords was made by Mr. W. H. Sotham, Mr. Erastus Corning, of Albany, having an interest with him in this importation. Soon afterwards another and larger purchase was made by the same parties, but this entire purchase was lost on the way from England. Besides this effort there had been from one to four or five animals brought over at different times by different parties. The Hon. Henry Clay, of Ky., imported some animals in 1817; so did Aston & Humphries, of Ohio, in 1852; and F. W. Stone, of Guelph, Canada, in 1860 or 61. The Clay importation made many friends for the Herefords.

Aston & Humphries' importation made considerable progress; so did Mr. Stone's. But of this it may be said that the Herefords were overshadowed by the Short-horn interest in Mr. Stone's hands, as he was largely engaged in the breeding of Short-horns at the time he imported the Herefords. It is of the Sotham importation that I will speak more particularly.

Mr. Sotham, in 1840, made an importation of 12 Herefords. From that date the Hereford-Short-horn controversy continued for 20 years, more or less, with varying fortune. The descendants of these cattle are now bred in their purity in many parts of the country; the most prominent breeder being the Hon. John Merryman, of Cockeysville, Md. He has made several importations from England, and several purchases from Mr. Stone, of Canada, and also from the Aston & Humphries' importation and one from myself, thus keeping up his outcrossess, and to-day he has a very fine herd. Representatives of the Corning and Sotham importations may be found in different parts of the country, from Maine to Colorado. And as the Herefords are coming to the front and their merits are being recognized, these cattle are taking a prominent position.



HEREFORD BULL, SUCCESS.

I met a gentleman at one of our State Fairs

two years since, who, had had some of these Corning and Sotham cattle in Vermont. He told me that he had owned them years ago, that they were the best dairy cows that he had ever owned, and that the young stock were always fit for the butcher.

Such men as Randall, E. P. Prentice, Roach, John Johnston, C. N. Bement, Van Rensselaer, Geo. Vail, Delavan, and other prominent farmers, breeders and politicians were engaged in the breeding of Short-horn cattle. With these might be named Ambrose Stevens, an importer of Bates stock; Allen, publisher of the Short-horn Herd-Book, and Page, the delineator of Short-horn lines. These were the men that Mr. Sotham met when he brought his Herefords to New York.

In 1841 the New York State Agricultural Society held its first fair at Syracuse. In 1842 it held its second fair at Albany, and I find that of the exhibitors who took premiums over 50 had exhibited Short-horns, while only two had exhibited Herefords. Among the Short-horn exhibitors were the names I have given, except Allen, Stevens and Page. I name these facts to show the influence that the Herefords were obliged to meet at their advent into New York State, and for another purpose, to wit: to show that the organization of the New York State Fair was effected in the interest of the Short-horns, so far as the cattle department was concerned. And this has been true of the different State organizations from that time to this. Discriminations are usually made in favor of the Short-horns and against the Herefords in the making up of classifications and premium lists and in the appointment of judges.

I raise these questions here for these reasons: first, because I believe them to be true, and second, because there must be many men yet living that will be familiar with the history of the Hereford-Short-horn controversy of 1840 to 1850. I refer to it also because there are many who believe that the general adoption of the Short-horns is an evidence of their merit as beef animals. As compared with Natives, they are good; but as compared with Herefords, they are not good. As dairy stock, compared with Natives, they may be good; but as compared with the Ayrshires, they are not good. And when the history of the Hereford-Short-horn controversy in England shall be brought out, it will appear that the Short-horns have taken their position by other means than merit. I do not wish to be misunderstood on this point.

A Bonner or Vanderbilt values a horse for the speed there is in him. If it is 2:15, they will pay thousands for him; if it is 2:50, they don't want him at any price. It is not because the 2:50 horse has no value; for my service he is all I want. So, if the Hereford will produce meat at 15 to 25 per cent. less cost than the Short-horn, and that meat is worth from 5 to 10 per cent. more money, then the Short-horn has not a value that the careful breeder and feeder will recognize. I am in receipt of letters from feeders in the Eastern States, who wish to feed for the purpose of keeping up their farms. Many of them would be satisfied if they could get the cost of the feed; but they say they cannot do it on grade Short-horns, and inquire as to the merits of the Herefords as feeders. To such I reply that there is a good profit in favor of the Herefords. And on this point I have a letter before me from a feeder in Missouri. He says that for several years he has been a feeder of about 100 steers a year, and that for two years past he has fed grade Herefords raised in Colorado, and that he will never feed any others, if he can get Herefords. Another man in this State, who feeds about the same number, says: "I had two grade Herefords in a lot of 100, and they feed out so much better than any of the others that I would like to know more about them;" and he raises the question as to whether their exceptional thrift was accidental, or whether the breed have so much better feeding qualities. Another says: "My grade Herefords and Short-horns have grazed together during the summer and fed together during the winter, the Short-horn grades making 400 pounds gain and the Hereford grades making 600 pounds, the Short-horns selling for $4.40 per 100 pounds, the Hereford grades selling for $5.12½."

I fed a pair of three-year-old grade Herefords from June 1st to December 1st, making a gain of 1,000 pounds, and a pair of two-year-olds during the same time, that made a gain of 1,200 pounds. The cattle-breeders on the plains in Wyoming, Colorado and New Mexico are crossing Hereford bulls on their herds, the produce of which are coming forward to our markets, though the demand for bulls is such that many of the calves are being kept for use. These white-faced steers will always command a better price than others that have been bred with them.

"WHAT COWS SHALL WE KEEP?"

IN the article in RURAL of March 22, the writer takes great pains to exalt the Ayrshire an top disparage the Jersey, Dutch, and Short-horn breeds of cattle. I care not how much the Ayrshires are praised, but when a writer undertakes to exalt his own favorite breed, by pulling down others, our suspicions in regard to his fairness are at once excited.

The position taken in this article, that animals consume food in proportion to their weight, has for a long time been an exploded fallacy. There is no class or breed of animals, from man downwards, that consume food in proportion to their weight. Every man as he sits at his table, discovers the fallacy of this assumption. A man of two hundred pounds' weight will often eat, day by day, no more food than the man who sits at his side weighing fifty, seventy-five, or even one hundred pounds less. Among horses, food is not consumed in proportion to their weight. Some horses will keep fat upon a given amount of food that would scarcely keep alive another horse of equal weight. Every observing farmer is conversant with this fact. The truth is the amount of food consumed by animals, depends as much, to say the least, upon their activity and nervous excitability as upon their weight. The difference in ability to digest and assimilate food, also enters largely into the problem of food-consumption. Some animals will digest and assimilate to their uses nearly all the constituents of their food, while others of the same class will assimilate a much smaller proportion even in the same conditions of life.

I do not learn at what Agricultural college the fanciful "Fred" mentioned in the article was educated; but I know that one of the Professors at Cornell University, in a recent address, utters the following language upon the question of consumption of food by animals of different weights:

"Somebody away back in the dim past laid down the rule, that 'animals consume food in proportion to their live-weight,' but seeing this would never do, he immediately added, 'other things being equal.' This amendment effectually annuls the rule, for other things never are equal. Can any one imagine that two twelve-hundred-pound, well-built Short-horn cows will consume as much as three coarse-headed, Gothic-ribbed, eight-hundred-pound ones? The chances are that two of the smaller ones would consume more than the two larger ones. The truth is, animals never consume food in proportion to their live-weight."

The figuring made by the fanciful "Fred," between Mr. Lewis's Short-horns, and Mr. Crozier's and Dr. Sturtevant's Ayrshires, is all based on the fallacy "that animals consume food in proportion to their live-weight." Certainly, if he knows as much of other farm business as he has learned about cows at college, he is a marvel, and "an agricultural college is a good place," indeed, "for a young man to" keep away from.

Another character brought forward by the writer of this article is nearly as fanciful as "Fred." I refer to "Mr. Martin." He is represented as saying: "These Jerseys, or Alderneys, as I call them, have ruined the stock of cattle here." This statement is put forth as the wise conclusion of a practical farmer, and there are those who will read it and imagine that it is a fair, unprejudiced opinion, indorsed by THE RURAL. The author of the article in question undoubtedly knows that "these Jerseys or Alderneys" are among our most valuable breeds for the improvement of the milch cows in our country, yet he has stooped to this childish attack that he may exalt his favorite breed above them.

Then the Dutch cow comes in for her portion of "blarney." Neither "Mr. Martin," nor even "grandfather," can believe the story of a yield of 16,274 pounds of milk in a single year. Mr. M—— and "grandfather" have probably been milking their favorite Ayrshire all their lives, and so the story is "tough," in the light of their experiences.

A PROTEST IN BEHALF OF HOLSTEINS.

IN the RURAL of March 22, under the caption, History of a Poor Farm, No. 6, a brief space was devoted to remarks on the above breed of cattle, and as these deprecatory remarks are so opposed to my own experience of that noble race, I must enter an emphatic protest against the slur therein cast upon it. In my dairy I have had Holstein cows that have made 10 pounds of butter a week in winter, and gave me from 45 to 60 pounds of milk per day. I have some Jerseys and Short-horns, and my Holsteins make a better use of their feed than either, or indeed than any cattle I ever owned. Moreover, they thrive well on coarse feed. For three or four years I sold more or less of their milk to the local milkman and he assured me it was the best milk he bought, and that which gave his customers the greatest satisfaction. I got the Jerseys and Durhams to try them, but I am pretty well satisfied they are not as profitable, all things considered, as the Holsteins; for these combine more good points than any breed I have tested.

A RURAL READER.

Dairy Husbandry.

COMPARATIVE EXHAUSTION OF SOIL BY CHEESE AND BUTTER-MAKING.

A. B. C., Westfield, Chautauqua Co., N. Y., asks for analyses of butter and cheese, so that by noting the ingredients of each, it may be seen which tends most towards impoverishing the soil. In a recent meeting of the local Farmers' Club one member stated it as a fact, that the sale of cheese from farms robbed the soil of plant-food, while the sale of butter had no such effect; and accordingly urged his hearers to quit making cheese, but to make all the butter they could; and our correspondent asks whether this view of the matter is correct; and, if so, what should be applied to the soil to supply the plant-food removed in the manufacture of cheese.

ANSWERED BY PROFESSOR L. B. ARNOLD.

Agricultural chemists are pretty well agreed that of the many substances taken from the soil in the growth of plants, but three are necessary to be returned to it to maintain its fertility. These are phosphoric acid, nitrogen, and potash. The most important of these is phosphoric acid, because of the large amount used in plants and the small quantity the soil contains. Nitrogen is just as essential in the organism of the plant, but then the earth absorbs it from the air in which it very sparingly exists in the form of ammonia and nitric acid, and showers of rain and snow bring it down in quite appreciable quantities. Potash enters largely into the ash of all plants, but the soil usually contains it in much greater abundance than the other two substances. There is often so much that the drain made by vegetation is not felt for long periods, and hence it is sometimes omitted in fertilizers for particular localities.

The different ways in which milk is disposed of affect the exhaustion of these substances unequally. The dairyman who sells his milk to consumers outside of the farm, makes the heaviest draft upon them. While we know this general statement to be true, we cannot with precision say just what the drain is in any particular instance, because milk is such a variable product. Its analysis shows that it is different in different animals, and in the same animal at different times. It will be an approximation to a general average to say that it contains 86.50 per cent. of water, 4.50 of sugar, 4.25 of fat, 4 of albuminoids, and .75 of ash. The material which enters into the composition of the carbohydrates, sugar and fat, need not be considered, since plants can derive them from the air. The ash and the albuminoids only need be regarded.

From the figures in our census for 1875, we estimate the annual yield of milk per cow in this State to be 5,128 pounds, but for the sake of convenience in estimating, we will put it in round numbers at 5,000 pounds. The ash of this weight of milk at .75 of 1 per cent., will amount to 37.5 pounds of which .6 or 22.5 pounds, are phosphates. To restore the phosphoric acid contained in these phosphates, will require one and a half times their weight of bone meal—33.75 pounds—which at $35 per ton, will cost 59 cents. soluble acid would cost more; but the slowly soluble bone is sufficient. The 5,000 pounds of milk, reckoning albuminoids at 4 per cent., will contain 200 pounds of nitrogenous matter, of which 16½ per cent. is nitrogen, causing an exhaustion of 32.5 pounds, worth 26 cents a pound, and is worth $8.45. But by reason of ammonia taken into the earth from the atmosphere and from showers, we need not return the whole of this nitrogen to the soil. Practically it is found that a fertilizer which contains one-third as much nitrogen as the weight of the phosphoric acid it contains, will keep up the productiveness of the soil, so far as nitrogen is concerned. We need therefore return only that much. One-third of the phosphoric acid in the phosphates in the milk is 3.75 pounds, and this weight of nitrogen at 26 cents will cost 97½ cents. The potash carried away in milk is small and variable, and hardly need be taken into account. It is liable to vary from 5 to 8 pounds in 5,000 pounds of milk. Its restoration would be amply covered by 14 pounds of German potash salts at 3 cents a pound. The whole expense of restoring the waste will be 59 cents plus 97 cents plus 42 cents, equal to $1.98 per cow yearly.

If this quantity of milk had been carried to a cheese factory, and after being made into cheese its whey had been returned and consumed on the farm without loss of its fertilizing power, the exhaustion would have been much less. To determine what the loss to the farm would be, we must subtract the value of the whey, as a fertilizer, from the value of milk for that purpose, which we see is worth $1.98 for the milk of a cow one year. Dr. Voelcker makes the average of 15 analyses of whey, to contain one per cent. of albuminoids in the form of albumen and caseine not worked into cheese, and 65-100 of one per cent. of ash, which has the same composition as the ash of milk. The quantity of nitrogenous matter in the whey as given by Voelcker, is believed to be larger than usual, and we reduce it to 9-10 of one per cent. As the four per cent. of nitrogenous matter in the milk gave us 32.5 pounds of nitrogen, .9 will give 7.31 pounds. But this is too large, because there is not as much whey returned as there was milk taken away, by about 15 per cent. Reducing the nitrogen 15 per cent., we have 6.2 pounds to return to the farm. But we have found by examining the per cent. of nitrogen in good fertilizers, that this is a larger proportion of what has been taken away than need be restored to keep up productiveness in grass lands especially, so that we shall have no occasion to count any loss in nitrogen on account of making the milk into cheese.

The ash in the whey returned is .86 of what it was in the milk. The phosphates in the whey will be, .86 of 22.5 pounds or 19.5. Reducing this 15 per cent, we have 15.575 pounds as the phosphates returned to the farm in the whey. Subtracting this from the phosphates carried away in the milk, we have 6.925 pounds, as the loss which can be restored with 20 cents, worth of bone meal at the wholesale price of $35 a ton. Following the same course with the potash, the loss will be covered by 13 cents, making the whole loss, at current rates for fertilizers, amount to 33 cents per cow a year. If the milk of this cow had been devoted to butter making, and the skimmed milk all used on the farm, there would be nothing lost on account of the sale of the butter. There is a small loss of nitrogenous matter in butter but it does not average more than 1-2500 per cent of the milk, and is too insignificant to be reckoned.

The foregoing will answer the question of A. B. C. in regard to the comparative losses to the resources of the soil, so far as milk, in its different uses, is concerned, but it by no means covers all the causes of exhaustion upon dairy farms. In the practical operations of dairy management, much larger losses than those growing out of the different uses of milk, are common. The food which the cow derives from the farm is a steady source of exhaustion, unless it goes back into the soil again. This seldom or never happens. The liquid manure from the herd nearly all goes to waste on most farms during one-half of the year at least. The waste from this source is large and tells heavily on the fertility of the farm. A cow is estimated to void more than double the quantity of urine that she does of milk, and it contains much valuable plant-food. The milk of a cow giving 5,000 pounds a year, we found to contain 32.5 pounds of nitrogen. The urine of such a cow, for only half the year, would contain three times that amount, half as much phosphoric acid, and more than five times as much potash as the whole year's milk.

The dairyman who declines making cheese of his milk because of the 33 cents' worth of exhaustion to the soil, and carelessly allows the waste of half or more of the urine from his herd, is saving at the tap and spilling at the bung. The solid droppings often share loss with the liquid. Whether piled under the eaves or lying in the open yard, water from the heavens usually carries away more or less, often one-half, of the most soluble and available part of the solid excrement and, with the liquid, sinks it out of reach, or washes it into some depression to make a mire-hole and a stench when hot weather comes on.

It requires the closest attention to every detail in the care of all animals fed on the farm, to prevent a much greater waste of plant-food than occurs in the most unfavorable use to which milk can be put—selling it from the farm. The avenues of loss in the restoration of fertility cannot, in any case, be wholly stopped, for every young animal sold from the farm, whether calf, pig or poultry, carries away an indefinite amount of phosphoric acid, potash and nitrogen in the form of bones, blood and flesh.

It is a good thing to have attention called to the losses which may occur in the different uses of milk, and how to restore them. We are glad to aid all we can in this direction, but we would not have the other prolific sources of exhaustion overlooked.

Industrial Topics.

CONSTRUCTION OF THE PLOW.

PROFESSOR S. M. TRACY.

Early Forms and Improvements.

AT a very early day our ancestors learned that in order to render the soil productive, they must make it loose and friable to give free ingress to air and moisture, and to give the tender rootlets room to develop themselves. For thousands of years the loosening of the soil was the only object that was sought to be accomplished by plowing. The only plow used was made on the principle of a pointed stick to scratch the surface of the ground, and only within the last four hundred years did the plow

begin to assume any resemblance to its present double-wedged form.

The first improvement in the shape of the implement was to make it in the form of a wedge acting horizontally, so as to push the furrow to one side and so give room for the next furrow. At about the same time another modification of the plow was introduced, which, instead of pushing the furrow to one side, raised it up and allowed the plow to pass under it. Both of these modifications were valuable, and it is largely to a combination of the two that we owe the plow of to-day. Pushing the furrow to one side was a convenience, and raising it up and allowing it to fall back was a benefit by securing greater pulverization; but still another feature was to be added before the plow could approach perfection. So long as the work was performed by a plow acting either horizontally or perpendicularly, the same soil always remained at or very near the surface, and soon became exhausted by repeated croppings. To insure the greatest fertility, the soil must not only be loosened, but fresh soil must be supplied by bringing the earth up from below and burying the exhausted portions until they are so recruited by the action of the elements as to be capable of producing another crop. This can easily be accomplished by inverting the furrow, an operation which requires something more than a simple wedge. From this we have the three mechanical operations to be performed by the plow, namely, to raise, move to one side and to invert the furrow-slice.

From about the year 1500 these three objects have been kept in view in the manufacture of plows, but until quite recently with very indifferent success, as there were no definite rules for giving to the share and mold-board their proper shape. All blacksmiths and most farmers were plow-makers guided entirely by the eye, and no two plows were made having exactly the same form.

Origin of the Present Plow.

Thomas Jefferson, third President of the United States, was the first one who attempted to apply mathematical rules to the construction of the plow, and was the first to introduce into America the use of cast-iron mold-boards. Jefferson's theory was that the form of the mold-board should be that of a regularly curved surface, presenting straight lines in a direction parallel to that in which the furrow-slice moves over it. This plow was rude and imperfect, but his work was of inestimable value, and it is to his efforts more than to those of any other one man that the plow owes its present form. By a somewhat complicated formula he attempted to make a "perfect plow"—one which should be a universal model—and succeeded in making a plow which was a great advance upon any other in use.

Since his time, numberless improvements have been made, but this principle has been kept in view in them all—that the raising and turning of the furrow slice should be gradual and continuous from the moment when the share enters the ground.

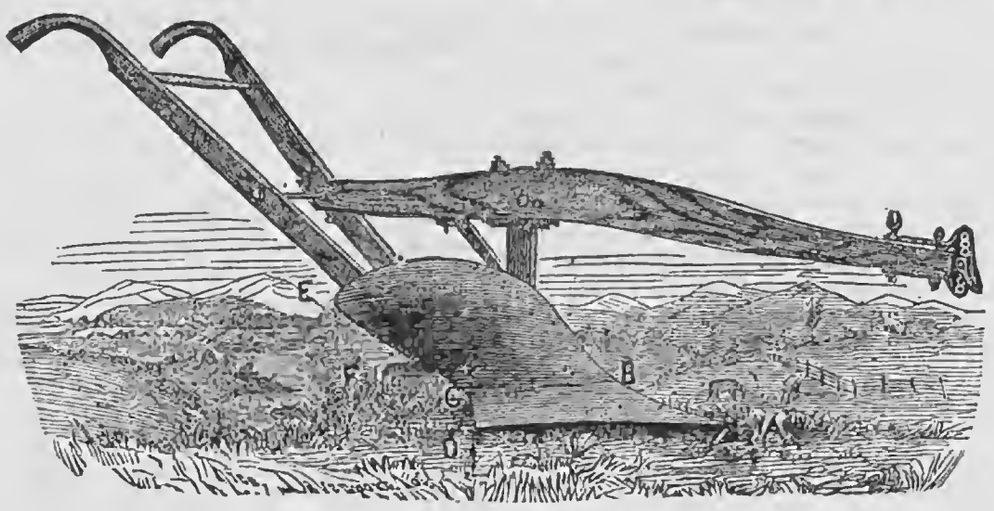
General Principles of Construction.

A "model plow" is an impossibility, as its form must vary with the work to be accomplished and the soil in which it is to be used. There are, however, a few general principles which will apply to all plows. A body will fall more rapidly on a curved surface than on an inclined plane, and more rapidly on a cycloidal curve—that is, a curve formed by a point on the circumference of a wheel when the wheel is rolled upon a flat surface—than on the arc of a circle. We may, therefore, infer that a body will be more easily raised and thrust to one side on a cycloidal curve than when moved in any other direction. As a matter of fact we find that plows in which this curve is employed—the point of least curvature being at the point of the share where it enters the ground, the curve extending from there nearly or quite to the top of the wing where the furrow-slice leaves it—raise and turn the furrow more easily than do plows of any other form. In many plows, especially in those made by country plow-makers, we find this line a segment of a circle, a very serious fault, as it increases the draft from twenty to twenty-five per cent.

With plows having the same width of share, the degree of pulverization effected will vary greatly with the distance from the point of the share to the end of the wing, the greater the distance and the less abrupt the twist given to the furrow-slice, the less it will be broken and crushed. For this reason, plows intended for breaking sod ground where it is desired to lay the furrow as flat as possible, are often double the length of those used where thorough pulverization of the soil is desired. The longer the mold-board and the sharper the wedge form of the share, the more gradual will be the raising and turning of the furrow-slice and, theoretically, the lighter will be the draft; but, practically, we find when the length of the mold-board exceeds a certain proportion to the width of the share, that the increased friction of the furrow-slice more than makes up for its lengthened curve, so that even when we desire to lay the furrow-slice perfectly flat, we cannot economically increase the length of the mold-board to more than about three times the width of the share. The exact

Proportion of Length to Breadth.

has never been definitely settled, but in nearly three hundred careful tests made during the past two years, plows having the following measurements have shown the lightest draft, while their work has been fully equal to that of any of nearly fifty patterns which have been similarly tested. Nos. 1, 2, and 3 were all tested



on stubble ground and were required to pulverize thoroughly a furrow eight inches deep. Nos. 1, and 2 were common two-horse plows. No. 3. was a sulky plow. No. 4 was a sod plow made by the manufacturers of No. 3. No. 5 was a two-horse sod plow. Nos. 4 and 5 were tried on blue-grass sod and were required to turn a furrow eight inches deep. Measurements are given in inches:

	No. 1.	No. 2.	No. 3.	No. 4.	No. 5.
From A to B	22	22½	25	20	17
" A " E.....	35	36	41½	44	42
" A " F.....	33	30½	33	36	31
" A " D.....	9	10	10	8½	10
" B " C.....	5	5½	5½	6	3
" C " D.....	15	15	16	10½	9½
" B " landside.....	14	14	15½	14	10
Draft per square inch of furrow section.....	4.15	4.31	4.96	4.86	8.63

In the plows noted above. No 1. showed the lightest draft on stubble ground. Of the two sod plows, No. 5 showed much the heavier drafts. The draft is given in pounds. It will be seen that the draft of No. 5 was very heavy—nearly double that of No. 4—but its work was by far the best. Had the wing of No. 4 been extended to, say, 48 inches instead of 44, so as to turn the sod more evenly, it would have done very much better work with but a slight increase in draft. and a plow having nearly or quite that form will be found to be the most satisfactory sod plow.

Between Nos. 1 and 2 there is but little difference. No. 2 is longer from A. to B. and from A. to E. and the draft is a trifle greater. No. 3 is shorter in proportion to its width, gives the furrow slice a more abrupt twist and has a heavier draft. The best form for an old-ground plow for general use is very nearly, if not quite, that of No. 1. If a wider or narrower share is used, of course, the other measurements must vary in proportion. The only object of the "landside" is to hold the plow steady in the furrow; but this cannot be accomplished by the straight bar of iron which is often used for the purpose. Neither the bottom nor the outside of this bar should be straight. If the bottom is straight, the plow may run well in level and uniform soil, but whenever the draft is increased by harder and more compact soil, the plow will run too much on its point or "root into the ground." A straight outer face to the landside makes no difference in the quality of the work, but it increases the draft. Both the outside and bottom of the landside should be slightly concave—from one-eighth to one-fourth of an inch.

The Line of Draft

is an important point in the construction of a plow, and one to which far too little attention is given. The line of draft is a straight line passing from the point where the traces are attached to the hames, to the plow at a point in the center of the furrow-slice. In a plow cutting a furrow 6x12 inches, the line would strike the mold-board at a point six inches from the landside and three inches above the bottom of the furrow. With the clevis attaching the doubletrees to the plow anywhere out of this straight line, the draft is increased and the plow runs unsteadily. The position of the clevis will, of course, be fixed by the shape of the beam, and the shape of the beam is entirely immaterial so long as it places the clevis directly in the line of draft.

Kinds of Plows for Different Soil.

In stony and sandy soils, cast-iron plows will do excellent work; but for the black, waxy soils of the great wheat and corn-growing regions of the West, a plow must not only be of fine-grained and very hard material, but it must receive the highest possible polish before it will "scour." The best material for such plows is found in the hardest of steel, steel so hard that glass can be cut with it as with a diamond. Plows made of this steel not only last longer, but do their work more easily than those made of iron or common steel. Many farmers object to having the share made of this hardened steel, because when taken to the blacksmith to be sharpened the temper is invariably spoiled and the share made softer than ordinary steel. This objection is a very slight one, however, as the share can be sharpened on the grindstone as well and as quickly as it can be done by the blacksmith, and the temper is preserved uninjured. Manufacturers of hardened steel plows usually make the share of either hardened or soft steel, as may be preferred, so that the customers can have their choice. For

The Beam

both wood and steel have their advocates. Wooden beams are frequently sprung by the plow striking a root or a stone, often without the plowman noticing the fact, and the clevis is thus thrown out of the line of draft; but as the plow will still do fair work, the owner is tempted to continue using it. Steel beams are never sprung out of shape, but are sometimes broken. They can be replaced, and *must* be replaced before the plow can be used again, and on this account many prefer the steel beams. The most important attachments to the plow are

The Coulter

and the sulky. Of the former there are three forms, one being merely a flange rising from three to five inches from the point of the share, and which only divides the furrow-slice from the land and does nothing toward cutting manure or muck which may be on the surface. Another form is a straight bar of iron passing from the point of the share to the beam and sharpened on the front edge. This coulter divides the furrow-slice from the land completely and pushes away the manure or rubbish, but does not cut it, and is very liable to clog. The rolling coulter now becoming quite common, is by far the best, as it not only divides the furrow-slice from the land, but when it meets any obstruction, it presses it to the ground and divides it like a knife. By its use cornhills can be split and piles of manure or straw cut so as to render clogging impossible. On stony ground such a coulter is liable to be dulled or broken, and for such soils the straight coulter is preferable, but on soils free from stones, even if filled with roots, the rolling coulter will be found better than any other.

The Sulky Plow.

In using the common plow, the weight of the plow and of the furrow-slice rests on the bottom of the plow, which is dragged along with a considerable amount of friction. The design of the sulky plow is to transfer the weight of the plow and furrow-slice from the bottom of the plow to the wheels, thereby greatly lessening the friction and holding the plow more steadily, and furnishing an opportunity for the driver to ride. Such plows are usually intended for three horses, and turn an eighteen-inch furrow, thus enabling one man and three horses to do three-fourths of the work which can be done by two men and four horses with common plows, besides doing the work in a better manner. Although the sulky plow is much heavier than the common plow, and the weight of the driver is added, the draft per cubic inch of earth turned is less, on account of the greatly lessened friction. In twelve trials of the same plow, used separately and attached to a sulky, a difference of about five per cent. has been found in favor of the sulky.

Sulky plows require large and moderately level fields for their economical use, but in such fields they will accomplish the work much more rapidly and better than it can be done with the common plow. For plowing among trees or stumps they are too large and awkward to handle well, and are not to be recommended. Many of the so-called "sulky attachments" are merely devices by which wheels and a seat are so arranged that the driver can ride and guide the plow, but unless the weight of the plow and furrow is borne on the wheels the draft is greatly increased, and the sulky is utterly useless except for cripples who cannot walk. The essential points in the sulky are: first, it must be so constructed that the entire weight is borne on the wheels; second, it must be easily adjustable, so that the plow will be perfectly level when run at any depth; third, it should be possible to secure the plow at any required depth, so that it cannot run out when going through unusually hard spots of ground.

Points to be Sought in a Plow.

In the construction of a plow, of course the first point to be considered, is the quality of the work done. Good work is the *sine qua non* of a good plow. The next point is the draft which is too often overlooked. In one series of tests with a large number of plows, many of them having but a slight difference in form, a difference of nearly ninety per cent. in draft was found between plows doing equally good work. With the best plow ten horses could do the work of nineteen with the poorer plow. Durability is another point and a plow costing from fifteen to twenty dollars, made of the best material, is often cheaper than the ten-dollar one "made to sell." Ease of management is also to be considered, but this is dependent entirely upon the form, and no plow which does its work well and with little draft, will run unsteadily or be hard to hold. These

Remarks

are not sufficiently technical to be of use to the manufacturers of plows, and they are designed only as a guide and stimulate to inquiry for those who buy and use them. If the success which farmers seek in their crops fails to reward their labors, the fault may often lie where they have been accustomed to exercise little thought and judgment—in the manner in which the plow has prepared the soil for receiving the seed. The best plow is the cheapest, and the man who aims at science and success in farming, should not willingly be ignorant of the principles which enter into the construction of the implements upon which his success so largely depends.

Field Crops.

HISTORY OF A POOR FARM.—No. 7.

Seeding to Grass.

THE swamp which has been ditched and cleared of brush, is now dry and perfectly free from surface water, the drains running freely. The tussocks are now being cut off with a broad, heavy hoe and piled up in heaps to dry, so that they can be burned off by-and-by. It is intended to cut up the surface of the swamp with a disc harrow, instead of plowing it, by which it will be prepared for the seed in a much better manner than by turning furrows. This is a new method of reclaiming a piece of swamp land, and the work has been closely watched by my neighbors. It was on a sunny day in March when some of my frequent visitors were examining the effect of the drains, and my plan was discussed very freely. My old neighbor was dubious about the economy of the process.

"What do you expect it to cost?" he asked.

"I suppose when it is all done that it will cost as much as the first year's crop or perhaps just a trifle more; and if it does not cost much more than that, it will be a remarkably cheap job," I replied.

"What crop do you intend to put into it?" asked Mr. Martin.

"Fred and I have been discussing that. I propose to seed it down to grass alone, and Fred thinks a crop of oats, to cut green for fodder, would be better, seeding down to grass with the oats."

"There would be two crops in place of one," said Fred.

"Oats will do very well in that mucky soil," remarked my old neighbor.

"That is very true," I replied, "but suppose the ground was sown with oats and then with six quarts of timothy and one bushel of red-top per acre, cutting the oats green so as to give the grass a chance to make a good growth in the fall, what would be the result?"

"There should be at least two tons of oat-fodder which would be equal to hay, and perhaps a late cutting of hay, if you had a good catch," replied Mr. Martin; "but that depends upon what grass-seed is sown. I would seed down with two bushels of orchard-grass and one bushel of red-top per acre."

"Orchard-grass is the best grass one can grow; it comes in early and it lasts until late," remarked the old gentleman; "I have had it growing in my orchard for some years, and it is the first that is green in the spring and the quickest to start after having been cut, of any grass I have seen; and it does well in wet places, too.

"There is a variety of grasses which grow well upon moist ground," said Fred; "of these timothy is first in value, being the richest of all the grasses in carbohydrates or heat-forming and respiration-supporting matters; but it has the disadvantage of being exhaustive of the soil. Orchard-grass comes next to timothy in nutritious value, while it has the great advantage of being more leafy, of earlier and more rapid growth and furnishing, in conse-

quence, a larger amount of green fodder for cutting or for pasture."

"That is precisely what I want, and what the majority of the farmers want in a grass," said I: "it is the qualities of earliness and lateness, of rapid growth and of leafiness, rather than 'stalkiness' that are the most desirable, and my experience of orchard-grass is that it possesses these qualities to a greater degree than any other grass. It has the habit, however, of growing in bunches unless it is thickly sown or it is mixed with other varieties; so that it would be better to mix some red-top and tall fescue with it to overcome this tendency. My idea is to proceed as follows: Break up the surface with the disc harrow and mellow it as much as possible, and sow one bushel of orchard-grass, half a bushel of red-top, half a bushel of tall fescue and four quarts of timothy per acre. This, I think, would give a close growth, which would produce early and good hay, and, if necessary, frequent cuttings for feeding green, which would be worth more than the crop of oats and the possible crop of aftermath."

"How would you seed it down?" inquired my old neighbor.

"That is a question which requires consideration. I am inclined to think it would be better to sow the grass seed alone and without any grain crop, such as oats, as you and Fred seem to advise."

"Won't the oats shade the grass and protect it?" asked the old gentleman.

"I don't think the young grass needs any protection, especially early in the season. When grass is sown with a grain crop, it is usually sheltered too much, and we get a weak, thin growth which is greatly injured or destroyed altogether when it is suddenly exposed to the hot sun and dry weather of July. This has the effect of killing out many a seeding which would otherwise succeed. On the other hand, when grass—or clover either—is sown by itself, the spring rains start the seed and the growth is substantial, strong, and hardy; and the crop becomes well rooted and firmly established before the hot weather arrives. I have tried this plan more than once or twice without any failure, while in seeding with grain there have been many failures.

"I am inclined to think that we make a mistake in our usual method of seeding to grass. The complaints of failures to catch are quite frequent, and a really good catch is the exception."

"I have not had a really good catch of grass and clover in 20 years. I think the weather in spring is drier than it used to be," remarked the old gentleman.

There is always a good excuse for avoiding a true reason, and most people are very ready to deceive themselves," said Mr. Martin. "All the supposed reasons why grass seed misses are, to my thinking, nothing but evasions of the well known fact that the soil is poorer than it used to be. There is something in that idea that grass should be sown by itself. It is the only crop grown that is permitted to be sheltered to death and smothered in the process. When the soil was fresh and rich, it was well able to sustain both the grass and the grain crops, and perhaps the grain crop was all the better for what the grass took from the soil; but now the soil is able only to grow one crop at one time, and the weaker one 'goes to the wall' when an attempt is made to grow two at once."

"Farming is poor enough business now, and how can we make it pay expenses, if we lose a crop every time we seed down?" said the old gentleman.

"What do we lose?" I replied. "You usually seed down with rye or wheat. You get perhaps 12 or 15 bushels of either, and that scarcely pays for the seed, harvesting and thrashing. Besides, every time a catch of grass is missed, you lose the value of the seed and the labor of sowing it. Now, if the rye or wheat crop is abandoned and the care given to that, is devoted to getting in the grass and clover in good condition, you would have a crop of hay to cut the first season, if a good catch is secured, and for three or four years afterwards you would have double returns from the hay or pasture. This will be worth more than the loss on the grain crop, I think.

"The truth is, we do not make half the use we should of our natural grass lands. A moist soil with abundance of decaying vegetable matter in it, is the best land for grass, and there are millions of acres of just such land abandoned to reeds and rushes and frogs. These swamps remain useless and positively injurious, because we either will not drain or reclaim them, or know not how to go about it. Again, it is a general opinion that our climate is unfavorable to grass, and that permanent pasture is something we can never hope for. I cannot believe it. We have never given it a fair trial. We are continually breaking up our grass lands instead of manuring them and encouraging an abundant growth of grass. As soon as we get a fair sod, the plow is put into it, and it is turned under to get a good crop of corn; and the work of years is thrown away and made useless just at the time when it is bringing forth its slowly-maturing fruits. I feel sure that if all our swamps were reclaimed, seeded to the proper varieties of grass, and reasonably managed, they would produce as much grass as is now grown on the uplands, leaving these to be plowed and made fertile with manure made in great part from the products of these natural-grass lands.

EXPERIMENTS WITH SEEDS FROM BUTTS AND TIPS OF CORN EARS.

I HAVE experimented somewhat in planting butts and tips of ears of corn. Never plant them unless for an experiment. My experience is that the butts produce shorter and thicker stalks and ears, a shallow and broad grain, a big shank, the ear apt to stand up when ripe. The tips' stalks are slender, the ears generally have fewer rows than the seed, and possess more of the Flint-corn nature. An old farmer told me he could run Dent corn into Flint in three years by saving only an inch of the tip of the ear. I think that perhaps he could effect the change, but not in that length of time.

Another reason for shelling off butts and tips of ears here is that we use horse planters, generally planting two rows at a time four feet apart, one man riding to drive, another to work the drop lever. We want from two to four grains in a hill, and those shelled from the butts and tips, owing to the unequal size of the grain, would make the hills unequal, some with too much and some with too little. A good-sized, perfect grain from the middle of the ear, has a larger germ and more substance to nourish a sprout.

The plant from it comes up quicker and is healthier, more vigorous from the start than that from the grains from either end of the ear, and, I think, holds its own through the season. I. O. A.

Freedom, Ia.

EXPERIENCE WITH WHITE PROLIFIC CORN.

I HAVE already ten bushels of White Prolific Corn raised from seed received of the Department of Agriculture last year, but I presume that it is one of the conditions required of all who enter for premiums, that the corn shall be received directly of you and of a certain quantity, so that all contestants shall share alike.—(Yes. Eds.)

As it may be of some use to RURAL readers, I here make a note of the result of my experiment with this corn last season. I planted half an acre of it on the 20th of April, 1878. Supposing from the small size of the grain, that it was one of the low-growing kinds, I drilled it in rows three feet apart with two feet between the drills. To my surprise, the corn grew unusually tall, and as a consequence, the planting was much too close. The situation was an unfavorable one, and the season proved to be cold and wet throughout. Notwithstanding these drawbacks, the plants averaged two ears to the stalk, and I noticed some standing by themselves which bore four ears. It would take from 175 to 200 of these ears to shell out a bushel. The corn was ripe about the 15th of September. Two days later, at least two-thirds of it were carried off by a great flood of New River, and I have therefore no means of knowing precisely what the yield would have been. I am not prepared to say that it will yield more than some other varieties which I could mention, but I am sufficiently pleased with it to give it a fairer and more extended trial this coming season. HUGH L. WYSOR.

Pulaski Co., Va.

Miscellaneous.

CONNECTICUT AGRICULTURAL EXPERIMENT STATION.

BULLETIN 22.

Fertilizer Analysis.

248. Dissolved Bone.

Manufactured and sold by Booth & Edgar, N. Y. Sampled March 20, 1879, by W. E. Wheeler, Stratford.

249. Stagg's Superphosphate of Lime.

Made (1874) and sold by John J. Park, Stratford. Sampled by W. E. Wheeler.

Analysis fixed to the packages as follows:

Moisture, organic and volatile matter	36.74
Sol. Phosphoric Acid	8.16
Insol. " "	19.35
Total Phosphoric Acid	27.51
Bone phosphate, equivalent to Phos. Acid	41.90
Nitrogen	2.31
Ammonia equivalent to Nitrogen	2.80

	248	249
Nitrogen	0.32	1.67
Sol. Phos. Acid	1.10	3.83
Reverted Phos. Acid	2.12	5.99
Insol. Phos. Acid	2.29	6.01
Ammonia equivalent to Nitrogen	0.38	2.03
Bone phosphate equivalent to total Phos. Acid	12.00	34.56
Estimated value per ton	$11.06	$35.45
Cost per ton	20.00	45.00

CORRECTION.

Mr. G. W. Baker, of Brooklyn, N. Y., writes under date of March 28, as follows:

"In relation to the Animal Scrap Manure (No. 244 reported in last Bulletin) there was a mistake in sending sample, as my foreman in putting it up, put up the wrong lot. The sample he sent was the lowest priced manure I put up, and which sells for $7.50 per ton.

The report as corrected stands:

	244
Water	44.0
Nitrogen	1.9
Phosphoric acid	1.0
Estimated value per ton	$6.25
Cost	7.50

Instead of $15.50.

S. W. JOHNSON, Director.

PLAN OF ORGANIZATION OF AN EXPERIMENTAL STATION AT CORNELL UNIVERSITY.

WE have received the following from Professor G. C. Caldwell of Cornell University:

I. The Station shall be called the Cornell University Experiment Station, and its object shall be the promotion of agriculture by scientific experimentation and investigation.

II. The Faculty of Agriculture of the University, together with the President of the State Agricultural Society, the Master of the State Grange and the Presidents of the State Dairyman's Associations, the Western New York Horticultural Society, of the Western New York Farmers' Club, the Central New York Farmers' Club, the Elmira Farmers' Club, the American Institute Farmers' Club and the Ithaca Farmers' Club shall constitute the *Board of Control* of the Station, till the next regular annual meetings of these Societies, when they may appoint delegates to represent them on the Board, one for each Society.

III. An annual meeting of the Board of Control shall be held at the University on the Friday following Commencement. Six members of the Board shall constitute a quorum for the transaction of any of its business.

IV. The officers of the Station shall consist of a President, Secretary, Treasurer and Director. Till the first meeting of the Board of Control these officers shall be as follows:

President.—Prof. I. P. Roberts.
Director.—Prof. G. C. Caldwell.
Treasurer.—Prof. A. N. Prentiss.
Secretary.—Mr. W. R. Lazenby.

At the first meeting of the Board of Control appointments shall be made by the Board to fill these offices, and the officers so appointed shall hold office till the next annual meeting of the Board, or till their successors shall be appointed at such regular annual meeting.

V. The duties of the President, Treasurer and Secretary shall be such as usually appertain to those offices. The Director shall be charged more particularly with the collection of the materials for the annual report of the Station, and the preparation of that report.

VI. The immediate management of the affairs of the Station shall be vested in an executive committee of the Board of Control, which shall consist of the four officers already named, and one other person to be appointed by the Board at its annual meeting.

VII. The Executive Committee shall be charged with the proper disbursement of the funds of the Station, and the general direction of its work, and shall carry into effect as far as practicable, the suggestions and wishes of the Board of Control as expressed at the annual meeting of the Board.

RURAL SPECIAL REPORTS.

(Continued from page 251.)

NORTH CAROLINA, Henderson, Granville Co. March 31.—We have had no snow all winter and this month on the whole has been mild and spring-like and, vegetation, is advancing rapidly. Peach trees are mostly in full bloom. The prospect is good for a very large crop for pears, apples, plums, and cherries, with the usual great promise of grape crop. Wheat at one time was thought to be much injured by the few very severe spells of frost we had in January and February, but it is uninjured and now looks splendid, wherever proper culture has been given. Fall oats have mostly been killed out, but spring-sown are promising finely. The continued low price of cotton—the staple crop here at present—is acting very unfortunately in regard to the profits of the planters and almost stopping entirely the immigration to this State, that a few years since promised to be very considerable. The land jobbers, however, have done more towards this stoppage than all other causes combined. Anyone intending to settle in this certainly beautiful and salubrious climate should consult the Northern people already settled here, and buy only of the owners themselves. There are good chances with cheap and good lands. Taxes here are only about one-third of what they are North and although our staple products are at present very low, yet they are proportionately not lower than Northern products. Then again, while cotton is about as good as gold when fit for market, we can also raise about every Northern production as well and, with proper culture, as much to the acre. Moreover, many around here, often realize handsome sums from tobacco for which Granville is so celebrated, and anyone visiting Henderson might be rather astonished at the numerous fine Tobacco Warehouses, Manufactories and handsome residences that have sprung up within the last five years. This is also a splendid fruit region especially for Grapes and Peaches, and it posseses every facility for exporting them to all the prominent Northern markets and in advance of many other fruit-growing localities, thus securing in general, high prices. H. S.

KANSAS, Seneca, Nemaha Co., April 7.—During March we have had repeated changes—from "very warm and pleasant" to "cold and blustering," and the mercury has by turns been down to zero, or up to 85° or 90° in the shade. We have scarcely had any rain this winter, and the high winds are making the soil very dry. Winter wheat in this country, at this present writing, looks very well. Spring wheat is all sown, and that which was put in early, is up, but needs the benefit of a good rain. Where the dead grass has been burned off, the prairies are having a greenish tinge. During the prevalence of the high winds, prairie fires have been very frequent and destructive, and much loss of property and even of life has been the sad result. Many of these fires are started by careless persons, or by the fire which flies from the passing locomotives. The immigration to this State is very great. Nearly every train which comes into Kansas, and every public highway to the vacant lands of the frontiers, are filled with swarthy and dirt-begrimed travelers for the "homestead region." Some of these have good "outfits" and some hard cash, while others have "very sorry rigs" and a limited supply of money, and are badly prepared for any reverse of fortune. For the sake of all such, it is to be hoped that the good Lord will not "go back" on Kansas, and that the year 1879 may be added to her years of prosperity. In this country, while there is the general complaint of "hard times," yet there is more than the usual amount of house-building going on. Quite a number of small dwelling-houses are being built, both in town and country. One evidence which I will note of a healthy prosperity among our farmers, is the general desire to procure better stock. Quite a large number of thoroughbred bulls, and a few fine horses have recently been imported here, and the determination seems to be pretty general to "grade up" all kinds of farm stock. The RURAL NEW-YORKER and other leading journals, are doing much to stimulate the people in this—the right direction. G. H.

NEW YORK, Rome, April 3.—In the spring of 1878 we were plowing the first of April. In fact, some farmers had been plowing in March; now we have only partially cleared fields of snow; the roads do not afford good sleighing, but no one has yet used a wagon on them in this vicinity outside of the town. There both wagons and sleighs are used. "When shall we be able to start the plows?" is a question asked by the farmers, but not easily answered. We have plenty of feed for stock. The prospect is that we have reached the bottom in prices of farm produce. There has not been a time in the last forty years when farm produce was so low in proportion to cost of production as the present, neither were taxes ever so high, not even in war time, considering the value of property then and now. Farms that were worth $100 per acre and over, during the war and later, have been sold this spring for less than one-half, and, in some instances, for about one-fourth the prices of inflation times. Many forced sales did not bring the assessor's valuation of the farms the past year. The outlook is gloomy to all farmers who are in debt for their lands, and in many instances the accumulations and savings of years will be swept away by the relentless mortgagee, who has, in many cases, had in payment more money than the farm will now bring when sold. It is a pity that farmers got into debt in times of high prices, only now to be sold out and left without house or home. If we learn wisdom by the present depression consequent on inflation and sure to follow, our hardships may be a blessing in disguise; but it will be a hard lesson for very many of us farmers to learn. If our legislators would enact a few useful laws, and reduce their salaries, thereby reducing our taxes to the lowest possible standard, and then adjourn for about four years, the country would then have a chance to recuperate and we should then be on the high road to prosperity once more. J. T.

KENTUCKY, Hedges Station, Clark Co., April 7.—Our wheat has withstood the long and hard winter better than we expected. The area sown last fall was greater than usual and the seed was selected with more care—a precaution mainly due to the teachings of the agricultural papers. If the suggestions and experiences these are constantly laying before their readers were judiciously adopted according to the circumstances of each farmer, our crops would be largely increased, our lands rendered more fertile or at any rate kept from becoming impoverished, and our own work made lighter. Clark County ranks first in this State, especially in live stock. The raising of

thoroughbred cattle, horses, sheep and hogs has become a greater industry in this county than in any other county of like size in any State on the continent. Yet the ordinary modes of feeding practiced by most of our farmers, show a sad lack of proper education and economy. Some of the finest fat cattle sent to Europe last year were fed on the blue-grass pastures by hauling the corn from the fields, stalks and all, and scattering it on the ground once a day. In this whole operation the waste was enormous. Lands and all kinds of stock are on the rise. Corn is selling at 60c. per bushel; wheat, 90c. to 95c.; hogs, 3½c.; best cattle, 5c. Blue-grass will in a few days be fit for pasture. P. L. C.

COLORADO, Bennett's P. O., April 6.—I live 34 miles east of Denver on the plains where very few of the ranchmen make gardens—not one in ten. I have two acres of garden, however, which I water by means of a windmill; for without artificial watering everything would be burnt up by July. I have tried corn here, but it has never grown well. I also tried potatoes with the same variety of seed for three successive years, but the third year they "ran out" completely. Peas, beans, parsnips, onions and turnips, all do very well with me, and so do a good many sorts of flowers. I have also tried trees in this treeless country. I find the Lombardy Poplars and Balm of Gilead, raised from cuttings, do as well as Cottonwoods. The latter are the only trees we have right here; but 30 miles away there are Pines. Last year I raised a few Scotch Pines and soft and hard Maples from seed; but this is rather a hard region for gardening: the hot sun and drying winds draw the life out of any plant that has not had a good start. We have had a hard winter in this region; a good many sheep have perished, and cattle are badly scattered and in very poor condition. Grasses are coming up well, but we need rain to give all vegetation a good start. J. W. S.

MINNESOTA, Winona Co., April 8.—We are getting ready for farm work hereabouts, and shall commence in a couple of days. A large number of farmers about here purchased *fruit* trees of a nursery at Dayton, Ohio, last fall. All of these trees have been winter-killed, although they were said to be iron-clads. They were mostly Duchess, Haas, Huzza, and Nicholas trees—all Russians. At the same time those purchased at a home nursery in this county, at a quarter of the price, though planted under the same conditions, are doing well, and are all alive. I think the farmers have learnt a lesson, and will purchase trees at home in future. Farm produce is low in this section: wheat, from 50c. to 90c.; oats, 20c.; barley, 50c. to 60c.; corn, 20c.; wheat bran at the mills, $3 to $4 per ton; shorts, $5 to $7 per ton according to grade. J. G.

WASHINGTON TERRITORY, Snohomish City, March 31.—After six weeks of rain, this is our first spring-like day. Money is hard to get. There's not much sale for logs, and logs are our chief commodity. Potatoes, 50c.; wheat, $1; barley, 50c.; oats, 1c. per lb.; corn, $1 a bush.; The Lost Nation wheat is mostly sown. A Mr. Le Day, sowed on a plot 8 by 12 feet, 235 kernels of Tenn: Headed wheat—something new here—and harvested 10 pounds, or at the rate of 57 bushels per acre. HARPER.

OHIO, New London, Huron Co., April 8.—Our spring is very backward. Roads very bad. Sugar weather comes slowly. We are selling maple molasses for $1 per gallon; but some sells as low as 80c. per gallon. Our large crop of fodder will be pretty nearly all fed, owing to the duration of wintry weather. Wheat is looking pretty well, considering the late sowing. Grass roots look well. Stock will come out of winter-quarters in good condition. B. P.

PENN., Annville, Lebanon Co., April 7.—Cold weather has prevented the farmers from plowing and working the ground as much as usual at this season. Still some oats have been sown, some potatoes planted, and some gardening done in this neighborhood. Winter wheat looks well, coming up green. Wheat sells for $1; rye, 50c.; corn, 25c.; clover seed, $3.10; potatoes, 75c.; hay, $7 to $8 per ton. J. A. B.

MICHIGAN, Grand Rapids, April 10.—We have promise of a good crop of fruit in this State. Peaches are injured on low grounds in the southern sections, but on our west shore, and as far North as Grand Traverse, the thermometer has not gone below zero, and tender fruits are all right. Where Apples did not overbear last year there will be an excellent crop. C. W. G.

KANSAS, EVERETT, April 8.—Winter wheat is looking fair. Oats are growing slowly. We need rain badly. Some farmers are planting corn and all are busy getting ready to plant. The peach crop in this vicinity will be a failure this year, on account of the cold winter we have had, and the cold weather now prevailing has injured plum blossoms. J. J. D.

WISCONSIN, East Troy, Walworth Co., April 6.—Stock are doing well. About the first of March the snow left us, and, thinking we were going to have spring right away, we plowed sod on the 11th. Since then it has been cold and backward. We are plowing again now, however, though it is snowing. Clover looked well before the last snowfall. H. A. T.

KANSAS, Oswego, Labette Co., April 4.—Anxiously looking for rain. Ground unusually dry for this time of year. Farmers busy plowing for, and planting corn. Some planted the last week in March. Oats coming up. Wheat looking well. Fruit buds injured, but not all killed. E. F. B.

NEW YORK, Brooklyn, April 14th.—During the past week the weather in this neighborhood has been extremely variable. We had a heavy snow-storm on Friday, sleet on Saturday morning, sunshine in the afternoon, clouds and cold on Sunday, and to-day a fine spring day. H. W. D.

IOWA, Conway, Taylor Co., April 5.—Fall wheat looks well here; spring wheat was all in by the 20th of March. Oats are about all sown. Fears are entertained that much fruit has been killed by the freeziug weather of this week. L. W. B.

NEW YORK, Worcester, Otsego Co., March 31.—This is a poor corn section. We have frosts in June, and our seasons for corn are often very short. It's too cold yet for making maple sugar, and there is plenty of snow. J. D. W.

NEW YORK, Fluvanna, April 8.—Ice 14 inches thick on Lake Chautauqua. Ducks, geese and swans, however, make their appearance around the mouths of streams running into the lake, and afford good sport to hunters. H. A. W

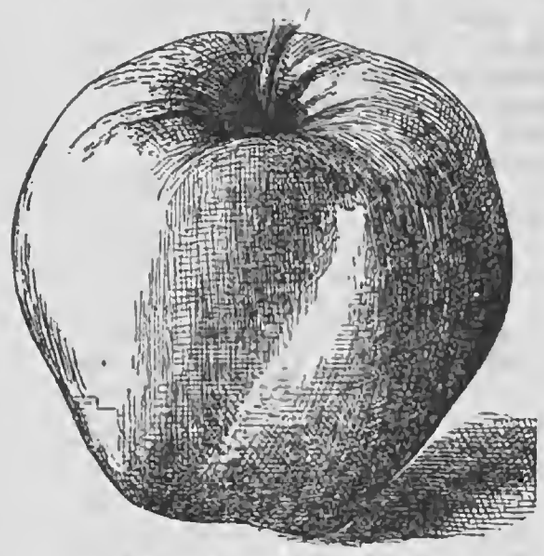
NEBRASKA, Beatrice, Gage Co., April 8.—There are 10,000 sheep within 20 miles of this place and plenty of room for more. A wool-buyer would do well around here this summer. R. L. B.

NEW JERSEY, Metuchen, Middlesex Co., April 9th.—Spring is backward; but grain is looking very well considering the hard winter we have had. S. W. H.

Pomological.

HIGHLAND BEAUTY.

E. P. ROE has a seedling Apple which he proposes to call "Highland Beauty," the accompanying sketch of which was made from specimens sent to this office a month or so ago. Under date of March 17th, he writes: "I send you to-day a few of my seedling apples. No special effort has been made to keep them over. The tree is a good grower but inclines to dwarf itself by overbearing. Many of the branches were like ropes of onions last year."



The apples were as perfectly preserved as if they had just been picked from the tree. The shape of the Highland Beauty is shown by the engraving. The color is a light, clear yellow, sometimes with and sometimes without a red cheek. The flesh is quite tender, the least bit acid, and of an agreeable flavor.

Will it take the place of the Lady Apple? is the question, no doubt, which has determined Mr. Roe as to its propagation and sale. We only present it to the reader as a new fruit, possessing peculiar merits, which will insure it a place among recognized varieties.

Floricultural.

GERANIUM NEW LIFE.

IN your criticism of "New Life"—in RURAL for April 5, you speak of it as not possessed of vigor. We think you must be mistaken, as in our experience with *it* we have found it an extra-vigorous grower. We now have fine specimen plants in seven-inch pots, which were taken from cutting bed not five months ago these and many smaller ones are now in bloom, and we cannot see why in vigor of growth or size and duration of bloom, it will not compare favorably with old well-known sorts. The great demand for it has led florists to push its propagation to the utmost. For this reason many plants sent out, after having been so forced, will grow but slowly for a time. We do not wish to see any *new plant* either praised too highly, or cried down, until it has had a fair trial. "Many men of many minds;" so with "New Life;" while some do not care for it, many call it beautiful and want it in their collections. We do not write this for publication, but only to admonish that the RURAL which is usually right, is sometimes mistaken. Keene, N. H. ELLIS BROS.

[We take the liberty to publish the above because several have spoken to us regarding "New Life," and we have received other communications all to the effect that we are much mistaken in our own estimate of the plant.—EDS.]

GERANIUM NEW LIFE.—*Eds. Rural*: Permit us to state that your estimate of the new Geranium "New Life" is quite astray. It *is* vigorous—bears fair-sized trusses and is with us the admiration of all who see it. Perhaps you have judged it too soon after receiving it from the florist. A. R. D.

New York City.

Various.

CATALOGUES, &c., RECEIVED.

R. DOUGLAS & SONS, Waukegan, Ill.,—We have received from this firm, the most extensive growers of evergreens from seed in this country by far, their circulars, catalogues, &c. for the present year. There are points in them to which we desire to call special attention, because they possess unusual interest, not only to our readers in general, but to the nurserymen of this as well as of other countries.

First. Among their thousands of evergreen seedlings have, from time to time, occurred sports which have been propagated and will be for the first time offered for sale in the autumn of this year. These are numbered, 1, 2, 3, 4 and 5, specimens of which were sent to us by Mr. Douglas two years ago to be tested in our grounds. They are very distinct and may be purchased entire by any enterprising firm that desires to control their entire propagation and sale.

No. 1 is a golden American Arbor-vitæ that remains conspicuously golden during three-quarters of the year.

No. 2 is also an Arbor-vitæ tipped with white.

No. 3 is a deep, though bright green Arbor-vitæ of a very compact and dwarf habit.

No. 4 also an Arbor-Vitæ, we ourselves mistook for a Retinospora.

No. 5 is a beautiful golden Juniper (Communis) of prostrate manner of growth.

Among other coniferous seedlings to be offered next fall are Abies Engelmannii—Abies Parryana, the A. Menziesii of Colorado—Abies Douglasii which withstands 30 deg. below zero without injury—Picea concolor—Pinus ponderosa—Sciadopitys verticillata (See RURAL of Nov. 24, 1877.

These will have completed their second year's growth in the fall. These evergreens, as well as deciduous forest trees, are sent by mail all over the country as safely as if they were securely packed in boxes. We have no space for further reference to the specialties of this immense seedling establishment. The circulars, pamphlets &c., will be sent gratuitously to all who apply.

WHAT OTHERS SAY.

GRATIFYING ACKNOWLEDGMENTS. — Among the late letters from our patrons, expressive of their satisfaction with the results of advertising in the RURAL NEW-YORKER, we select the following for the reason, first, that their words carry with them the weight which attaches to establishments of national reputation; and second, for the reason that they are proofs that the influence of the RURAL is confined to no special State or part of our country:

RICHMOND, Ind., March 5, '79.

RURAL PUB. CO., Gents:—Our last advertisement in the RURAL NEW-YORKER paid us very well indeed, as we have already traced several good sales to it, with a prospect of still more. Yours very truly, RICHMOND CITY MILL WORKS.
L. T. LEMON Sec'y.

SANDWICH, Ill., March 28, '79.

RURAL PUB. CO., Gents:—We can trace to our advertisement, now running in the RURAL NEW-YORKER, many good sales, and, all things considered, we believe it to be as valuable a medium as we have ever used for reaching the better class of farmers. Yours truly, SANDWICH MFG. CO.
J. P. ADAMS, Sec'y.

BATAVIA, Ill., March 29, '79.

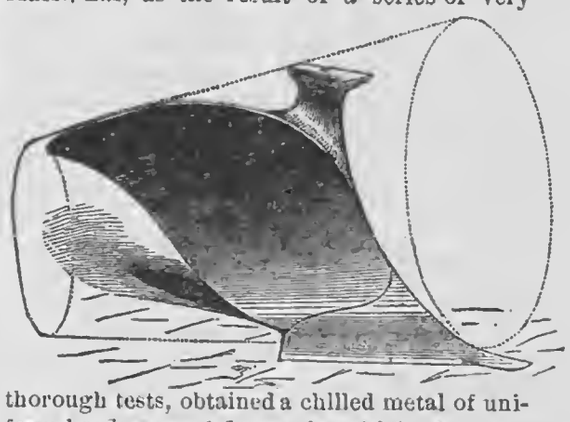
RURAL PUB. CO., Gents:—For several years we have advertised in the leading agricultural papers of the country, and can positively state that the "RURAL NEW-YORKER" has brought us more letters than any other weekly we have made use of. We consider it one of the best mediums for reaching the leading farmers. Yours truly,
UNITED STATES WIND E. AND P. CO.

THE BEST RED RASPBERRY.—Charles Downing tells the N. Y. Tribune that the TURNER is probably the best red Raspberry. Of course much depends upon the location and taste of consumers.

Industrial Implements.

A NEW HARD METAL PLOW.

MR. GEO. TAYLOR, the agent of the Belcher and Taylor Agl. Tool Co., of Chicopee Falls, Mass., has, as the result of a series of very



thorough tests, obtained a chilled metal of uniform hardness and fine grain which the company will introduce this season. It has been subjected to the roughest usage in the field and has withstood the most persistent efforts made with a view to detect undesirable qualities. The conical plow made by this corporation will be cast in this metal this season. This plow, the shape of the mold-board of which we illustrate, is making a very handsome record in all kinds of soil. The conical pattern is found to promote a very light draft. Another plow in great favor is the Oneonta Clipper, an iron-beam swivel plow that combines some very important improvements, notably the shifting handles, which bring the coulter in position at each turn of the mold-board. The plow can be turned without taking the hands from the handles—a very convenient and labor-saving arrangement. These and other plows are fully described in the spring catalogue (now ready) sent out free by the company

MR. W. P. EMMERT, Freeport, Ill., seems to be a collector of inventions that may be best appreciated in the household. His catalogue now before us gives answers to a large number of questions asked us by our correspondents. There are scores of these little inventions, simple in themselves, that are a great help in the daily routine. He has devised a plan by which purchasers may club together and get a liberal discount from the list price on orders so sent.

In addition to his catalogue, he has published a new treatise on butter-making, which he is willing to give free to those interested in the dairy, if they will be at the pains of asking for it, which is certainly liberal, as the book contains some good ideas.

C. AULTMAN & Co., of Canton, Ohio, issue two very pretty catalogues this season, one descriptive of the improved "Buckeye" mower and reaper, and the other explaining the advantages of the "Sweepstakes" thrasher. Such literature is important to every farmer who proposes to keep informed of improvements in machinery—and those who do not keep "posted" will, in the end, regret the oversight.

TOLLEY'S New Patent Champion One-horse Cultivator is a new implement being introduced by the Wheeler and Melick Co., Albany, N. Y. Its peculiar feature is a screw-shaped tooth that can be set to throw the soil to or from the plants. Besides this unique improvement it embraces other features that make a cultivator valuable. It is sold at a low price.

THE Dexter spring, to which our attention was directed during the Centennial, is a very durable, easy and cheap spring, and one that people living in the country can appreciate. It will stand the most severe usage, is very cheap in price, and when mounted under a vehicle, it is handsome in appearance. The Dexter Spring Co., Hulton, Pa., is the maker.

THE Walter A. Wood Mowing Machine Company has been awarded the contract by the Secretary of the Interior to supply the Indians in the Indian Territory with mowing machines and reapers. The contract will amount to about $8,000. This is the first time the government has furnished the Indians with mowers and reapers.

BRADLEY & Co., of Syracuse, N. Y., and Chicago, Ill., have their catalogues of mowing and reaping machinery now ready for the season of 1879. Their machines are very thoroughly made and have merits that every practical farmer will approve of.

THE Little Giant Tile Mill, made by Baylies Vaughan, & Co. of Richmond Ind., seems to be the subject of very general comment among "tilers" at present, and the pamphlet issued by the firm will be found of interest. It is sent out free on application, we believe.

THE catalogue of Russell & Co., of Massilon, Ohio, for 1879, just received, is very attractive in appearance and illustrations, and describes the new thrasher made by this company very clearly. It may be had on application.

The Querist.

ANSWERS TO CORRESPONDENTS.

Queries About the South.

B. F. J., Townsend, Schuyler Co., N. Y., asks, 1, whether the timber on the pine lands of Georgia is of any value at present; 2, will the lands produce good crops after having been cleared; 3, what proportion of the population are negroes; 4, what are good rice and cotton lands in Louisiana and Alabama worth, and whether much rice is grown there; 5, what can be said as to the healthfulness of the above three States.

ANS.—1. Certainly it is; besides a great amount of it used for domestic wants, a heavy export trade is done in it, from Savannah, Darien and St. Mary's. The part of the country in which it is chiefly found is a sandy belt a short distance inland from the sea coast. 2. Yes, with proper seed, tillage and manuring. The pine lands of Georgia, and indeed of all the Southern States, are by no means the most productive parts of the country. They are usually sandy and yield but scant crops with what care they receive. 3. At the time of our last federal census, in 1870, Georgia had a population of 638,926 whites and 545,142 colored. Since then the relative proportion has altered little, if at all. 4. The production of rice in Alabama is comparatively small, it having yielded only 222,945 pounds in 1870, while Louisiana yielded 15,854,012 pounds, and South Carolina and Georgia 32,304,825 pounds and 22,277,380 pounds respectively. A comparatively small part of the States is suitable for rice cultivation as rice fields need to be drained and flooded at will. They must be above salt or brakish water and below the reach of freshets, so as not to be flooded at unseasonable times. The best rice lands are on the banks of rivers having a deep soil, chiefly of decomposed vegetable matters, and so situated as to be overflowed by the opening of tide-gates. The price varies so much in accordance with situation, character of soil, facilities of transportation, and improvements, that it would be unsafe to mention any particular figure. Lands suitable for cotton cultivation can be bought all the way from 25 cents to $75 or even $100 an acre according to fertility, improvements, &c. Rice lands can be bought cheaper in Louisiana, perhaps, than in either of the other States. 5. Georgia, especially the elevated interior of the State, has a good reputation for healthfulness. Chills and fever, however, are by no means uncommon on bottom lands and Yellow-Jack occasionally scares the seaboard. Much the same remarks apply to South Carolina. The pine lands of Louisiana are healthy enough, but the most productive parts of the State are very unhealthy for immigrants, while on most of the lands suitable for rice cultivation bull-frogs and alligators alone feel safe against chills and fever. Rice lands everywhere in the South are the most unhealthy parts of the country for Northern immigrants.

Blood Poisoning by Distemper.

R. S., Dunville, Va., has a thoroughbred mare that had the distemper badly but seemed to have recovered from it, and was put to work. Suddenly, however, after a light day's labor on a cold day, she was taken sick, her legs swelled, her body was marked with knots and lumps and she has become so very stiff as to be hardly able to move, though she still has a fairish appetite, and he asks for the cause of the ailment and a remedy therefor.

ANS.—Distemper is a specific fever in which the blood is seriously affected and a morbid product is thrown off from it through tumors beneath the jaws. If by any means—and exposure to cold is the worst possible that could occur—the process of throwing off this morbid and diseased product is arrested, it is returned to the blood, and this becomes poisoned. The consequences are just such as are set forth above. A dropsical condition of the legs and abdomen occurs from the gravitation of watery matter from the disorganized blood, into the tissues; nodular swellings, similar to those of farcy, appear in the skin, or the swellings become patchy and a rheumatic condition of the muscles produces stiffness. The treatment proper in such a case is to give diuretics, with antiseptics, to remove the poisonous matter from the blood, and to sustain the strength by nutritious food and tonics. The following may be recommended: half a drachm of iodide of potassium to be given in the morning, powdered and mixed with honey and placed on the back of the tongue to be swallowed; one ounce of hyposulphite of soda given in the evening in the food, which should be nutritious but laxative, such as boiled oats, linseed meal with oatmeal, scalded, and mixed with cut hay. The limbs should be well rubbed with a coarse woolen cloth frequently and for a considerable time. The drinking water may be made distinctly sour with sulphuric acid. This treatment may be continued for several days until improvement takes place when the iodide may be stopped, the soda be reduced one half and one ounce of gentian powdered be given once a day, with one ounce of carbonate of iron if the animal is weak and the appetite is poor. Care should be taken not to break the skin where it is swollen, as in that case sores difficult to heal might occur. If the skin is itchy and irritable, it may be sponged with a solution of bicarbonate of soda. A curry-comb should not be used until the skin becomes normal again.

Formulas for Fertilizers, of Very Doubtful Utility.

W. G., Trappe, Talbot Co., Md., sends us three formulas for making fertilizers named "Home Fertilizer," "Powell's Formula," and "Star Bone Phosphate" and asks which is the best for wheat and corn. He already has the "right" of making one of them, and is thinking of buying the right of making the better of the other two. In case we should not wish to give the names, he suggested that in naming our preference we should employ the figure prefixed to each formula.

ANS.—Answering the last remark first, we say once more what we have said before, that the object of this Querist Department is to benefit our readers generally by therein answering honestly to the best of our ability, all questions of general interest or importance to them. In the present instance this could not be done, if we concealed the names of the formulas about which our opinion is asked. These look very much like a humbug or a fraud. To sell such a formula for money, is something like charging an equal sum for information on such a common matter as putting butter on bread or using salt with food. There is nothing of value in these methods of mixing ordinary fertilizers, and any ordinary farmer who reads an agricultural paper should be well able to compound a better mixture for himself. To call common salt "muriate of soda" is a disguise which looks suspicious, and to advise a single mixture of bone dust and oil of vitriol is a palpable and injurious fraud, because it would be a dangerous thing for any person to do, and it would be injurious instead of beneficial to vegetation, unless the combination was made in such a way as to effect a chemical action which would neutralize the sulphuric acid entirely and leave none free to exert its exceedingly corrosive effects. A mere mixture would not do this. Our opinion is here given and our advise is not to give one cent for the "right"—as it is called—to make a mixture which would be worth much less than its cost, when it is made.

A Foul Well. Mole Plows.

S. G. T., White Plains, N. Y., asks, 1, how to purify a well rendered thoroughly foul by the percolation into it of the contents of a broken sink drain. All the adjacent ground is probably equally foul from the same cause. 2. Having read that a mole plow is used in some parts of the country for the purpose of making tileless drains, he inquires whether it would "work" where the sub-soil is a sort of hard-pan. He thinks a flat meadow of his would be greatly benefited by drains made in this cheap way.

ANS.—1. The well is spoiled and should be abandoned, as the use of the water is dangerous to health, and might cause fatal disease. It is a matter in which life is at stake, and there should be no hesitation in abolishing the danger at once. This is an example of what exists in many cases without suspicion of the danger involved. 2. A mole plow is useful where there is a very retentive sub-soil. Its effect is only to break up the soil and not to open continuous passages for the water as in draining, because it is impossible to avoid following the contour of the surface, and no level can be kept by which the flow can be led away. Where there is a general slope, the mole plow may do good service by opening passages by which the water can more easily percolate and flow off more quickly. As the implement is cheap, and its use has certainly the advantage of sub-soiling, and possibly of draining to some extent, more or less of the ground, it would be generally of advantage.

A Cow's Period of Gestation.

A Subscriber, Xenia, Ohio, asks what is the average period of a cow's gestation, and how much over or under that average have cows been known to calve.

ANS.—The average period is held to be 285 days. Of 575 cows observed by Mons. Tessier, 21 calved between the 240th and 270th days, the mean time being 259 days; 544 calved between the 270th and 299th days, the mean time being 282 days, and 10 calved between the 299th and 321st days, the mean time being 303 days Earl Spencer's record of the period of gestation in 764 cows gives: the least period 220 days; mean, 285 days; longest period, 313 days. But he was not able to rear any calf produced at an earlier period than 242 days. Our own countryman, L. F. Allen, reports the period of gestation in 50 cows for a single year as follows: shortest period, 268 days; mean, 284 days; longest period, 291 days. These cows were Short-horns, Herefords, Devons and their grades, together with some "Natives," but no difference was noted that could be attributed to breed. It has been noticed that bull calves are oftenest dropped when the average period is overrun, and cow calves when the period of gestation falls short of the average. In reality there is not much difference between the number of calves dropped each day from the 280th day of gestation to the 290th.

The Washington Potato.

M. L. D., Sherman N. Y., inquired in our issue of March 29 about the merits of the Washington potato, and we replied that we had never tried it. We thank Mr. Jonathan Talcot of Rome, N. Y. for the following information on the subject. He says:

"I suppose M. L. D. has reference to the new potato to be sent out this season by the Messrs J. M. Thorburn & Co., 15 John Street, New York. If so, I will say that through the kindness of that firm I received a sample in the spring of 1878 from them, with a request to cultivate and test them and report in the fall. This I did. I wish also to state that I have tested most of the new sorts of potatoes sent out the past twenty years, and paid out hundreds of dollars for the seed, only to be disappointed in the majority of cases. I have, however, found a few sorts that have proved valuable to myself and the country at large. Accordingly I think I know something of the merits or demerits of new potatoes, and my advice to M. L. D. is to try the Washington. If it does as well under general cultivation, as it has done with me, it will prove a decided acquisition. In our past unfavorable season for potatoes, it did well in yield, appearance and quality with only ordinary cultivation—much better than other sorts on our trial grounds."

Planting Currants.

L. B. D. R., Backland Mass., asks whether in putting out an acre of Currants it would not be best to have half of them Red Dutch, with Cherry or La Versaillaise; at what distance apart should they be planted; and whether white Currants have only a limited market.

ANS.—The Currant is the most hardy, prolific and accommodating of fruits, for which reason (there can be no other) it is of all fruits the most neglected. If well pruned and cultivated, the fruit will grow to thrice the size of that which neglected bushes yield. The Red Dutch under such care becomes as large as the Grape or Cherry when neglected, and being more prolific, in fact the *most* prolific of Currants, should be given a proportionate share of our grounds. We have no doubt that the Red Dutch, cared for as we have intimated, will, year in and out, prove the most profitable variety. Four feet apart each way would be our choice of distance. About 2700 plants would then be required for an acre. There is less market demand for white than red Currants.

Coloring Instead of Painting Plaster.

M. E. C., Spring Hill, New Brunswick, is building a new house and having heard that there is a way of coloring the finishing coat of plaster instead of painting it, asks for a recipe for doing so.

ANS.—There are some very agreeably colored preparations made for the purpose above mentioned, known as prepared kalsomine. These are kept for sale by painters, and directions are given on the packages for using them. The materials consist of Spanish white, glue and mineral coloring matters of the desired shade, or the finishing coat itself may be colored of any desired shade by adding to it, and working up thoroughly with it the proper pigments, always choosing those which would not be changed by the action of the lime or plaster. It would not be easy for an amateur to make a neat job, as the coloring should be perfectly even all over the work, and that will require much skill.

Mulching.

B. J. U., Sandusky, O., asks whether in view of the chances of a dry season, he shall heavily mulch a number of plants which he names.

ANS.—It is hard to get at facts in many seemingly simple things. There is no doubt that in dry seasons a heavy mulch or covering of manure, straw, or other substance will be of decided advantage to many plants, such as Currants, Strawberries, etc., in the way of producing larger fruit. We once thought, however, that several of our Magnolias were killed by mulching, and have since thought that several other plants were harmed by it. Mulching produces a sour condition of the soil and the growth of fungi, which may be injurious to the roots underneath.

The English Walnut.

M. J. C., Bewleyville, Ky., asks where she can procure English Walnuts of one or two years' growth, and whether they would thrive in western Kentucky.

ANS.—Any fruit nursery can furnish them, such as Ellwanger & Barry or W. S. Little, Rochester; Thomas Meehan, Germantown, Pa., etc. The European Walnut (Juglans regia), commonly known here as the English Walnut, has not been very extensively introduced into this country yet, where indeed it rarely ripens fruit. As it is a native of Asia, and probably also of Greece, and grows abundantly throughout Europe, it would, very likely, find a congenial home in Kentucky.

Propagating a Pelargonium Sport.

C. A. H., Akron, O., asks how he can propagate a variegated "sport" taken from a Geranium (Pelargonium). He says it roots freely, but the cuttings lose their color and become green.

ANS.—The only way is to make cuttings from the shoots most variegated and then, as soon as these are large enough, to make cuttings from them, and so on until the variegation becomes fixed. The variegated blood or taint is sometimes so feeble that it cannot be fixed. In some plants—we have in mind a Willow and a Begonia—well-defined, variegated sports occur which, when cut off and rooted, remain variegated while the new growth is entirely green and healthy.

Shingle Roofing.

J. T., Jamestown, N. Y., asks whether for farm buildings there is any better roofing than shingles, cost considered.

ANS.—There is no roof that is better, cost considered, than shingles. A well-laid shingle roof will last thirty years, and if the shingles are of pine and are steeped in crude petroleum before they are laid, and receive a fresh coating outside once in six years, they will last twice as long. The shingles should be laid upon lath or narrow strips and not upon boards; the exposure to the air keeps the under side free from damp and prevents decay.

Tucket Corn.

E. C., North Platte, Neb., asks where can he obtain Tucket corn. It is a sort of pop-corn he used to raise years ago in Vermont. It made a growth of three feet, had on each stalk several ears from two and a-half to three inches long, the grain being small, flinty and yellow.

ANS.—This is a local variety and some Vermont reader can doubtless give the information. Yellow pop-corn can be procured of Thorburn & Co. All pop-corn has the habit of caring at most of the joints and has small ears.

Miscellaneous.

R. B. A., Germantown, Pa.—1. We cannot name varieties of Pelargonium with any certainty. The flower resembles Asa Gray. 2. It is the rule of our office to answer *every* question either in these columns or by mail. In the former case they must await their turn. 3. It was impossible for us to foresee which of the varieties of seeds we offered to our subscribers would prove the most popular. In more than one instance, those which we fancied would receive the fewest applications, received the greatest number. Hence our supply was soon exhausted. This possibility, however, was foreseen and we took pains to state that "Some of the above will be withdrawn and others added." Now our *reserve* seeds were fully as valuable and *rare* as those at first offered, yet many of our friends are disappointed that they did not receive *just* what they *selected*. The simple truth is that in *any* free seed distribution of the magnitude of that we have just passed through, it is impossible to please all. Still we have learnt a thing or two by our late experience and have a plan for our next offer, which will at least secure to each applicant the kind of seed announced.

J. B., Jamestown, N. Y., asks, 1, where can he obtain seeds of the Dutchman's Pipe; 2, are the ornamental beets useful or merely decorative; 3, can the seed end of potatoes be cut off now and kept until planting without injury, and, if so, how should they be treated?

ANS.—1. We do not know. It is hard to be found. Try Woolson & Co., Passaic, N. J. 2. The roots do not grow large. The leaf stalks (see Domestic Economy, p. 544, in issue of Aug. 24, 1878) make an excellent substitute for Asparagus. Otherwise they are for ornament. One of the showiest beds we have ever seen was made of these beets. 4. Should say, no.

C. McN., Union Springs, N. Y., says he has had a Weeping Silver Fir for five years, and that with the exception of one shoot every branch grows downward. This one shoot is "as straight as a pike-staff." He asks: "Is this common?"

ANS.—The Weeping Fir is itself what is called a "sport," and it is not improbable that the straight shoot is a reversion to the species. But perhaps it grows from *beneath* the graft, in which case, of course, the "straight shoot" *is* the species. Please examine and let us know.

I. G. M., Charleston, S. C., asks which book on bee-culture we consider the best, and what style of hive he should adopt.

ANS.—Cook's Manual of the Apiary, published by T. G. Newman & Son, Chicago, Ill., is as good as any we have seen. Get a movable frame hive. The Langstroth hive, with frames about one foot square, is perhaps the best style that can be adopted.

F. W. S., Baden, Pa., asks which method is the best for grafting large apple trees—cleft grafting or bark grafting. He grafted 75 trees in the bark last year and they are

doing well, but he fears the young branches will not cover up the old limbs and unite well and strongly.

ANS.—We prefer grafting in the bark. By this method the cion will unite as firmly with the stock as by cleft grafting. See answer to C. T. in last issue; and also Rural of March 15, 1878.

M. M. S., Big Valley, Beiber Co., Cal., asks whether we can procure for him and forward seed of the forage parsnip, an account of which is given in the RURAL of March 15.

ANS.—As yet the parsnip has not, so far as we know, been imported into this country, though some seeds taken to England, are reported to have done well there. There is no purchasing agency connected with the RURAL NEW-YORKER.

J. D., Brooklyn L. I., who in our issue of the 5th, inquired where seeds of Hyacinthus candicans could be obtained, is hereby informed by L. A. G. that they can be procured from Hovey & Co., 16 South Market St. Boston, Mass. This variety is a Cape bulb, and throws up a stem three feet high with white flowers; said to bloom the second season from seed—in midsummer.

R. S. P., Bolster's Mills, Me., asks whether the corn sent out by the RURAL would do well "away down in Maine," and in the northern part of it at that.

ANS.—Probably not.

COMMUNICATIONS RECEIVED FOR THE WEEK ENDING SATURDAY, APRIL 12th.

NOTES FROM CENTRAL ILLINOIS.

HOW TO GROW NICE SWEET POTATOES.—Sweet potatoes are easily grown when once the method of their growth is understood. I have had a good deal of trouble in their cultivation owing to their growing in the shape of long strings instead of tubers, and it is only of late I have learnt the cause of my failure. I chose good, light, sandy soil; worked deep, cultivated well, and yet got strings. An extensive grower tells me he formerly had a like difficulty in securing good sweet potatoes, but after years of experiment, he is now able to grow a large crop with the same certainty as corn. As he took the first premium for that crop at the Chicago Exposition, I believe he is right, although his practice is opposed to my old theory which insisted on working the soil deeply. He claims that the sweet potato is a gross surface feeder, and adapts his culture to this characteristic. Having chosen suitable soil, he scatters well rotted stable manure, broadcast, on it in February or March, and when he is ready to plant the potatoes, he *plows very shallow*, leaving the subsoil undisturbed, and then he works and pulverizes very finely the soil thus turned. In this, he claims the plant feeds, and when, on reaching the subsoil, it meets with resistance, it at once begins to develop nice tubers. If the soil is pulverized deeply, he says, long, rambling strings, instead of tubers, are the result.

THE DEFIANCE WHEAT was counted, to get the number of grains, then mixed in a fine leaf mold and sand, in a box, and then set out to freeze and thaw, taking the weather as it came. Meanwhile, in the second week in March we had some nice days, the soil working well, and a plat was prepared large enough to plant the wheat one foot apart, in rows two feet apart. As soon as it sprouted, it was put in and is now up—most of it. This locality has not proven well adapted for spring wheat; but I believe if the seed were prepared as above, it would do a great deal better, but would have to be sown before sprouting much.

COVERING VINES.—All my briers were laid down last December and covered. Owing to this precaution, they will not only escape being winter-killed—a fate that has befallen all others here—but they will have a good crop of berries. About the middle of March the Snyder Blackberries were fresh and green. This seems wonderful, since all the exposed briars of Dorchester, Wilson's Early, Lawton, and Kittatinny, were killed and black to the very crown. Taylor's Prolific came out all right.

DR. A. C. W.

INDIANA, Roanoke, April 7. — Rain, snow and ice alternately; some fine, warm days; many frosty nights. Our Peaches and many of our Cherries have been killed. Trees, shrubs, Raspberries and Strawberries are coming out of the hard winter looking well.

Implements and Machinery.

NICHOLS, SHEPARD & CO.,
Battle Creek, Mich.
ORIGINAL AND ONLY GENUINE
"VIBRATOR"
THRESHING MACHINERY.

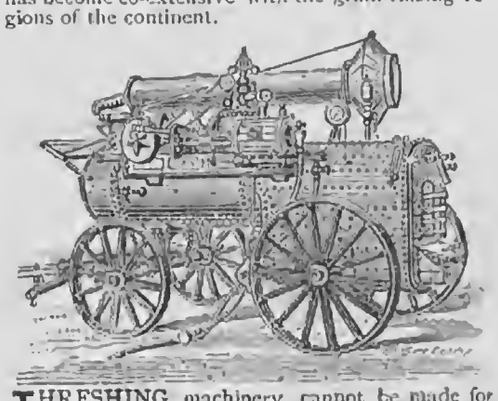
WE are sometimes asked why the prices of our goods are apparently higher than some others of inferior make, and we avail ourselves of this opportunity to place the matter in its true light.

OUR "VIBRATOR" Threshers and Portable Engines embody the best results of our experience and study during our long business career. Whatever would add to their durability, efficiency, and solid excellence, in any particular, has been eagerly seized upon and utilized without regard to labor or expense.

IN this connection it will be pertinent and timely to warn the public against **Cheap** Threshers and **Cheap** Portable Engines. The superiority of our machinery, in all particulars, is now so generally acknowledged that our competitors have no resource but to present the attraction of low prices and long credit. Their goods being inferior, they have to sell them for what they can get. Times are hard; and purchasers, without fully considering the subject, will sometimes allow a lower price to decide them. Manufacturers of "cheap" machines are so set on carrying out competion to its utmost—competition of **Cheapness**, not of Excellence—that they meet "bargain hunters" half way, and furnish them cheerfully with inferior machines at the cheap rate they are asked for.

WE are much mistaken if this is what the public wants or expects of us. Good machinery cannot be made when neither workman nor employer has pride in his occupation; interest and pleasure in the work are both wanting, and both are essential in making good machinery.

OUR mission and business is, to build Threshing Machinery **of the Highest Excellence**, whatever the cost, and, holding firmly to this single purpose, we have added improvement after improvement, until the reputation of our Machines has become co-extensive with the grain-raising regions of the continent.



THRESHING machinery cannot be made for nothing, even with the aid of machinery. Our prices are as low as they ought to be, and, without doubt, as low as they ever will be. Do not be deceived with mere cheapness—**quality always descends faster than price.** Low price, especially in Threshers and Portable Engines, means **Low Quality, with Low Performance and High Repairs.**

NICHOLS, SHEPARD & CO.,
Battle Creek, Mich.

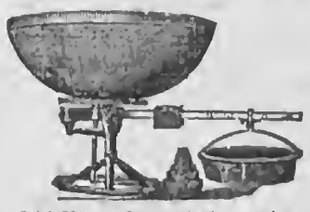
NEW BUCKEYE

LAWN MOWER.

The lightest and easiest-running Mower in the market. It is unequaled for Simplicity, Strength and Durability. Every machine fully warranted. Ask your dealer for it, or send for circular to

MAST, FOOS & CO.,
Springfield, Ohio.

A Perfect Butter-Salting Scale.



Every pound of butter salted alike. Salts from three-quarters to one and a quarter ounces to one pound of butter. No MISTAKES. Will WEIGH ANY ARTICLE, from ¼ oz. to 61 lbs. No Dairyman or Butter-Maker should be without one of these SCALES. Warranted to give satisfaction, or money refunded. Sent C. O. D., or on receipt of price—**$5.** Send stamp for Circulars. Address

BUNNELL & BROWN,
Guilford, Chenango Co., N. Y.

5 Cents Per Bushel Saved

Sharpless Strawberry.
The Largest, Best Flavored and Most productive, Berries grow with ordinary culture, 6 to 12¾ inches round. 40-page Catalogue of **Greenhouse Plants and Small Fruits** FREE; with colored plate of Sharpless, 10c. Address **J. L. ELLON,**
[Mention this paper.] **Bloomsburg, Pa.**
BEAUTIFUL FLORAL PLANTS BY MAIL.

THE LADY GRAPE.
The best and earliest perfectly hardy **White Grape** in America. Ripens in August, and is hardier than Concord. Two strong vines, post-paid, by mail, for $1. One dozen 1 yr., $4. Also Delaware, Concord, Brighton, Moore's Early, and all other valuable varieties, over 60 kinds, at greatly reduced prices. Raspberries, Strawberries, Gooseberries, Flowering-plants, &c.
Catalogues free.
GEO. W. CAMPBELL, Delaware, Ohio.

214 Bushels of CORN TO ONE ACRE.
McClure's Prolific Corn actually produced 214 bushels of corn to the acre, on ordinary land with usual cultivation; proof of which was given in October issue of FARM & FIRESIDE. It is a large white variety; gives greater yield than any other corn under same circumstances; one grain produces several stalks and from 3 to 10 large ears; makes finest meal and best fodder. We will send 1 package, containing enough to plant 10 square rods, by mail post-paid, to any one sending 60 cts. for 1 year's subscription to FARM & FIRESIDE, the most popular Agricultural and Home Journal in the world. One package given as a premium for sending two subscribers to FARM & FIRESIDE at 50 cts. a year.
ALL OTHERS WANTING CORN
Can obtain it by sending 25 cts. for 1 package, or $1 for 5 packages, to J. S. CROWELL, Manager FARM & FIRESIDE, Springfield, Ohio, but send all subscriptions to FARM & FIRESIDE, Springfield, Ohio, as usual.

Send for N. D. Batterson's Berry Basket Circular, Buffalo, N. Y

It is a mistake to suppose that any department of a paper may be slighted. The most important information is to be found, at times, under the guise of an advertisement; and it is agreeable to the advertiser and a courtesy to the publisher to mention the source of your information—in other words, to mention the paper.

ANNOUNCEMENT.

ALL who intend to compete for our CORN PREMIUMS will be expected to write to us to that effect before the TENTH of May.

EARLY MATURITY.

IT is a well-known fact, although it has been proved but recently, that an animal makes its most profitable growth in the earliest part of its life. A noted example of what we wish to illustrate was given a few years ago by the Hon. Geo. Geddes, in regard to a steer fed by an Orange Co. (N. Y.) farmer. The figures given in the very particular statement furnished by Mr. Geddes, showed the cost of the animal from the first month of its existence up to the period of four years, when it was slaughtered. At two years of age, the steer showed a profit in its feeding, but from that time the cost gradually exceeded the growth in weight, until at the end of the four years there was a serious loss. It has been found by trustworthy experiment that a young animal will gain one pound in weight from the consumption of three pounds of corn meal or its equivalent in food of similar quality as to digestibility and nutriment; that four pounds of meal will be required for a pound of increase at six months; four and a half pounds at 12 months; five and a quarter pounds at 18 months; and six pounds at two years. By judiciously generous feeding a calf may be made to gain 100 pounds in a month; while a three-year-old animal consuming twice the food which supplies the calf, will increase only 50 pounds in a month.

There is no occasion to enforce the application of these facts; they are suggestive enough to attract the attention of all those whom they may concern. But at this season when we are preparing to plant and sow our fields, it may be pertinent to allude to the analogy which exists between animal and vegetable life. The latter exists by food as much as the former, and the manner of growth in each is parallel with that of the other. The laws which control the healthful growth of an animal may well be applied to our culture of plants, and from the former we may learn that the early forcing of a crop may be done at the least cost. Our method of fertilizing, or feeding, crops may be open to the objection that we pour into a weak organization a vast surplus of food by which its growth is stunted, or we starve it by giving food as yet unfitted for its wants, or by neglecting to supply food at all. Generally the whole supply of fertilizers is added to the soil before the crop is planted. This must certainly be a wasteful practice, because active decomposition and diffusion are going on, when there is nothing in the shape of roots adequate for the utilization of the products. If we believe there is any analogy existing between animal and plant growth, we should feed our crops accordingly. Let us apply barnyard manure before the planting, if we will, because we cannot avoid that, and leave it to decompose and become available as the roots may reach it; but we should apply some active fertilizer in the hill, or drill, or near the seed, in small quantity, suited to the feeding capacity of the young plant, and in quality fit for its actual need at this period; and afterwards, as may be proper, add a further supply at each cultivation (of cultivated crops) to be worked into the soil or occassionally to be carried in by rains. In these limits the subject can only be hinted at, but it is presented as food for thought and a work for experiment.

UNPRODUCTIVE CAPITAL.

ONE of the most serious losses in farming is from unproductive capital. Auctions have been rather plentiful this spring, as many farms have changed owners or have been rented, and at those which have come under our notice, the fact which has most impressed us has been the large amount of old traps, worthless for every practical purpose, but which insensibly accumulate on every long-occupied place. It is a good plan to sell off this stuff occasionally and turn it into money; but buyers are rather shy of late years and not even long credits will tempt them to buy unproductive articles. Generally, those who do buy are the least thrifty farmers in the neighborhood, and they generally have more need to make an auction than to attend one.

The trouble with farmers stocked with this idle capital is that they are usually the very ones who most need money to carry on their farms as they should. Not one farmer in fifty has working capital enough, and investing money in such a way that it will produce nothing is the sure way to keep in that condition. Extravagant expenditures are justly censurable; but it is practically the same, so far as profit is concerned, if the farmer heavily in debt, keeps two or three supernumerary horses which he is not able to employ and which cost him fifty dollars a year above all that he can realize by using them, or invests seven hundred dollars in pianos, fine carriages and household luxuries. In the latter case he is presumably the gainer. He gets something for the money expended, and his family derive some pleasure and advantage therefrom. Yet there is many a farmer who has several hundred dollars invested where it is practically of no value to anybody, who would be horrified at the idea of expending one-half or one-quarter the sum in ways that his family at least would appreciate.

To make the best possible uses of his money is the necessity for all whose capital is deficient. Some years ago we knew a shrewd German who owned a valuable yearling colt. He wished to keep it, but being offered a fancy price, sold it and invested in a sow with pigs and a cow. He bred pigs for sale, and as the demand happened to be good, his profits on the pigs and from the butter and milk of the cow were probably five times as great as they would have been on the colt. In a year or two he purchased a mare with foal, had for the time a more serviceable horse than the colt would have been, and was ready to make another payment on the place which he had bought. It is scarcely necessary to add that this man, though he bought when prices were high, is steadily making money. All successes in farming in these times must be won by as shrewd and close attention to details as is here recorded. Nothing is easier than by leaving a portion of a farmer's capital entirely unproductive, to waste more than the small profits on the remainder.

THE MILK QUESTION.

THE milk producer is a hardly used person. His reputation is held in question, if indeed he is not set down as being no better than he should be by those self-constituted censors of public morals, the universal grumblers. His product is taxed by the public carrier and by the middlemen, of whom there are at least two, who come in between the producer and the consumer; and the latter fares unusually well if he is not defrauded by the considerable dilution of his daily supply. Indeed, it may truly be said that the consumer shares with the producer the misfortune incident to his position, and is alike the victim of the middlemen. For between the two, the difference of the two or two and a half cents per quart received by the one and the eight to ten cents paid by the other, is swallowed up by those who carry and distribute the milk.

Thus the producer receives one-fourth of the final value of his product in payment for his labor, the food consumed by his cows, the daily deterioration by age and otherwise of his stock, the cost of utensils and all the other necessary adjuncts of his business; while the middlemen receive for their share the remaining three-fourths. And this plain fact certainly brings up the question as to the relative value of the services performed by each, and the inadequateness or excessive amount of the compensation. There are other staple products besides milk that would offer equally interesting subjects for contemplation.

THE GLADIOLUS.

WE should feel lost without the beautiful Gladiolus. It has been our favorite among flowers of its class ever since the first improvements were made by seedling cultivation twelve years ago. Then five dollars were not an exhorbitant price for a single bulb of a new sort and, indeed, even now nearly that price is charged for the finest, latest varieties. But *then* high prices were paid freely, while now very few are sold for more than a dollar each. The climax of improvement has not yet been reached, however, in this charming flower; at least there is no doubt but that new colors and combinations of color and new forms will yet be originated to maintain, for years to come, the intense interest which lovers of the Gladiolus have shown from the beginning. We were the first to tell, we believe, of a light-*blue* variety which originated on the grounds of a florist on Long Island, and was exhibited for a few days in this city. Several English journals commented upon our statement as one which they could not credit. There were many others who saw the flowers, however, so that, sooner or later, we may count upon the remarkable addition of a blue variety. *Double* flowers, also, occur here and there, though we have not heard of any instance in which they have been *fixed* or perpetuated by seedling cultivation; and judging from the double flowers which have occurred among our collection, such a variety would prove no great acquisition. It does not seem to us that the Gladiolus can be improved by such a change.

There is no better time than from now until the first of May to plant the bulbs, though for succession of bloom they may be planted as late as the first of July, and still bloom before frosts severe enough to harm them.

To those of our friends who have never cultivated the finer varieties of Gladioli—which we should prefer to the Lily, were their flowers as delightfully fragrant,—we would mention the following as being among the finest, and yet of a comparatively low price: Mary Stewart—Princess Alice—Shakspeare—Addison. If a yellow is desired, Eldorado is as good as any.

WORK AND PLEASURE.

IT is not uncommon for those who have much work to do to complain that they have little or no time for enjoyment. This is especially true of the young. The very name of play or pleasure has a magical transforming power. That name makes toilsome pastime a delight; while the idea of work often makes the easiest tasks seem oppressive. It is not to be denied that there is wisdom in proper recreation and diversion for the laborer. They are necessary to keep up the spirits and maintain somewhat of the charm of freshness in one's occupation, whatever it may be. It is well, now and then, to "lay down the shovel and the hoe," and turn the mind away to the quiet scenes of the home and to the exhilarating pleasures of a holiday.

But very unfortunate are they—young or old—whose real enjoyment is limited to those rare occasions when work is, for a while, relinquished, and so-called pleasure is sought in extraordinary ways. Now, we are so constituted that, under the law of habit and the peculiar effect of conscious usefulness and promising engagements, we may come to love our work and find in its legitimate prosecution the very essence of contentment, hope and joy. To work with the right purpose and in the right way is to convert work into pleasure. What a fortune is possessed by the man that has attained to that desirable experience! His work-days are more than holidays; for they add to the pleasure of the common holidays the cheering assurance of gain and progress.

Glucose in Sugars.—The sugar refiners are all of them now making grades of crushed and granulated sugars purposely adulterated with about ten per cent. of glucose or "corn sugar," a sort of sugar made by a chemical process from corn-starch, and costing about five cents a pound. The glucose is only about one-half as sweet as cane sugar; but, when properly made, it is just as wholesome, and as good in all other respects. As the mixture of this with refined cane sugars is usually for the purpose of underselling, the refiners do not make a great profit out of it; and although the retailers in many cases keep the price up, at least at first, competition there also tends to force down prices so that profits are equalized. But consumers ought to know the fact of this admixture of an inferior sugar with that which they have heretofore been using. Detection of the fraud by ordinary inspection is difficult, yet the glucose sugars are usually damper and somewhat "off-color," compared with pure cane sugars. When buyers understand the matter, and insist either upon pure sugars or a less price for that which is so mixed, the temptation to the adulteration will be greatly lessened.

BREVITIES.

MR. EVANS writes to us: "I, too, think the Plymouth Rocks the general-purpose fowls."

WE wish we had in our N. Y. Horticultural Society a little more of the vim, earnestness, generosity and ability that characterize the directorship of the Mass. Hort. Society.

DANA'S Hovey is one of the very best of Winter Pears, the only objection to it being that it is rather small. It is of a bright yellow color when ripe, with a little cinnamon russet. The flesh is buttery and melting and of finest quality.

To play is to labor. It is pleasant because it is the work of our choice. The great problem is to make all work play—then Jack will never be a dull boy. There is just so much work for everybody to do. Let us do it in accordance with the moral and physical laws of our being—and it will be as play.

Is it not remarkable that statements so diametrically opposed should be made by those who have tested the value of Prickly Comfrey? The present season will unquestionably determine who is right. If it appears that this plant possess any especial claims to cultivation, we shall doubt if it be safe to express an opinion, no matter how well it may be supported by our carefulest tests.

COL. WELD tells the writer that he considers the Plymouth Rock the earliest to mature of any of the thoroughbreds, but that the offspring of a cross between a P. R. cock and Asiatic hens will prove decidedly earlier than the Plymouth Rocks. This he knows from his own experience. It is a bit of valuable information for those who raise fowls and eggs for market.

FROM all over the country come cheering accounts of reviving business and easier times. True it is, these accounts come chiefly from middlemen—from store-keepers, wholesale or retail—but the middleman must "feel good" before either the producer or consumer can expect to realize a satisfactory profit. That, according to his own account, he "feels good" to-day, is a hopeful sign that his victi—his customers may "feel good" to-morrow, or perhaps the day after, or at any rate some time in the not very distant future.

MR. HAINES says that the Raspberry, "Pride of the Hudson," has not proved as hardy as it was at first thought would prove to be the case. Protection helps it. We are sorry if this report should be the average report for this climate, for one reason, if for no other, that hundreds of plants have been purchased under the belief that it *would* prove hardy. We find that the word 'hardy' is an exceedingly meaningless word as applied to Raspberries in general, and to the red varieties in particular. We have not a single plant in our collection that has not been harmed by the past winter.

PROF. Law agrees with the RURAL that other parts of the country, especially the West, should be willing to pay a part of the cost of stamping out pleuro-pneumonia in the Eastern States. The reasons he gives therefor are the same as previously stated here—that our foreign cattle trade benefited mainly the West; that its speedy resumption would therefore be specially beneficial to that region; that in case of the spread of the disease to the unfenced plains there, the losses would be enormous; that the stamping out of the malady here would be a benefit to the entire country, and that the entire country therefore should be willing to pay for the blessing, those parts paying the most which derive the greatest advantage from it.

A NEW OIL-CAKE, prepared from the seed of the sunflower, has been introduced into Denmark and Sweden and meets with decided approval. "Ugeskrift for Landmænd," a weekly Danish agricultural paper, gives the results of analyses by Prof. Bergstrand of Stockholm and Dr. Wolff of Germany, which show it to be rich in albuminoids, fat and carbo-hydrates. It is also stated that the proportionate value of rape-cakes, linseed-cakes and sunflower-cakes is much in favor of the last, it being both cheaper and more nutritive. Thus when a given weight of rape-cakes is worth $7, the same quantity of sunflower-cakes will be worth $8.13. Feeding experiments in Sweden with this new product show that the cattle will eat it greedily, that it increases both the quantity and richness of the milk, and that the butter from such milk is of the best quality.

A BILL introduced into the U. S. Senate appropriates $250,000 for the purpose of stamping out contagious diseases among cattle in this country. It proposes to investigate all contagious maladies among stock, slaughter all animals infected with pleuro-pneumonia and take prompt and vigorous measures for eradicating this standing menace to our vast cattle interests. Some sticklers for State rights doubted as to the constitutionality of an act empowering the general government to interfere in measures, the adoption of which, according to them, properly belongs to the States individually, and so the bill was referred to the Committee on Agriculture, with instructions to report it promptly. A month ago we pointed out editorially the justice and necessity of such a measure, and we trust that no Quixotic scruples as to State rights will be permitted to delay its speedy adoption.

THE heavy emigration of the Southern negroes to the West is pretty certain to result in not a little temporary distress to the "whites" of the abandoned regions and to the emigrants themselves. If the former are "planters"—the aristocratic Southern equivalent of "farmers"—they will lose by untilled fields, ungathered crops, empty purses and general out-door and in-door thriftlessness; and if they are store-keepers, they will suffer from the lesson that the absence of competition cannot always justify the exaction of exhorbitant profits even from "niggers." The improvident and impecunious emigrants will have to endure the hardships that always await upon the advent of the pennyless new-comer in any frontier region, and these hardships will be aggravated by disappointment at the downfall of the bright hopes whose only foundation lay in his own ignorance or credulity. But the Caucasian and Negro are likely to be benefited by the movement in the long run, the former by the lesson that forbearance and honesty are more profitable to their owner in the end than intolleranee and chicanery, and the latter by the higher manhood that is always developed by the necessity for provident labor and a sense of independence.

For Women.

CONDUCTED BY MISS FAITH RIPLEY.

SPRING FASHIONS.

No. 1.—Ladies Costume.—This costume is composed of two shades of drab suiting, trimmed with white worsted braid. The skirt is four-gored, short and round. The overskirt, before it is draped, is like a six-gored walking-skirt; but by following the label-directions for draping, it is transformed into the pretty washerwoman style of overskirt here illustrated. The reversed portion has a short panel at each side outlined with braid, and decorated with buttons and simulated button-holes, while along the top of the portion, between and back of the panels, six flat rows of braid are arranged. The flowing drapery of the back is bound with braid, and where the reversed portion is caught together over the back, a cascade bow is fastened. The pattern is No. 6,523; price, 25 cents. It may be made of bunting, Summer flannel or de beige. If costlier goods are used, pipings of satin or rich gimp may be substituted for the braid, The basque has a deep vest and a short cutaway front, each fitted by a single dart. The front is extended in a back collar-portion, and turns back from the shoulder nearly to the waist-line in a pretty lapel. Below the latter it closes with two button-holes and buttons, and then slopes away to a deep point, back of which it extends in an arched outline to the side-back. After a skirt portion of the dark vest shade has been joined to the vest, the skirts of the under-arm gore and side-back are allowed to fall over it in a continuation

No. 2.

of the front, and then the added portion, the back and the side-back skirt, are joined by the side-back, while the corners of the side-back are reversed and caught to the corresponding corner over the center seam of the back. These *revers* are faced with the dark goods, and fastened under a ribbon. The vest and added skirt are decorated with braid and buttons to correspond with the overskirt, and the bottom of the jacket portion is bound with braid. The lapels and collar are also faced with dark goods and bound with braid. Pattern of basque, No. 6,522; price 30 cents.

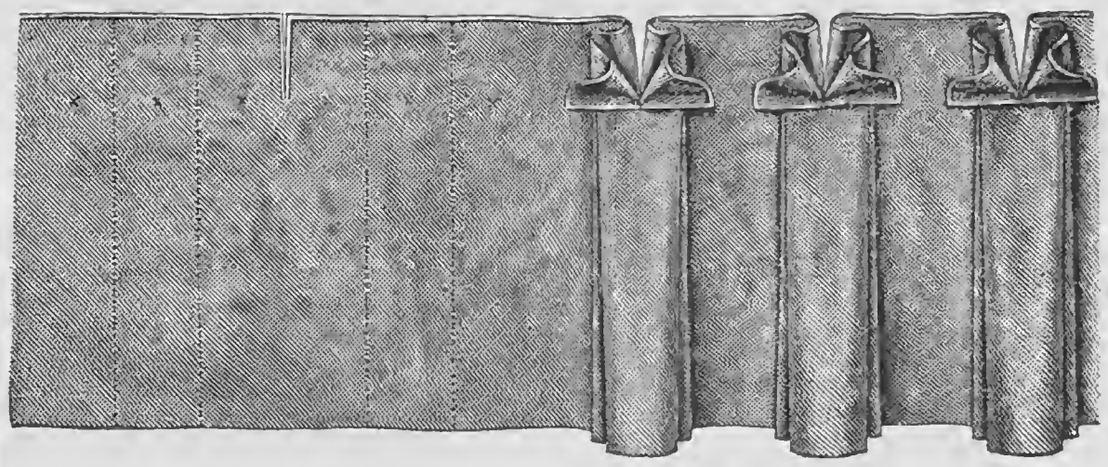
No. 2.—Alsacian Bow.—This represents a style of head-dress which is extremely popular at present. It is easily made. Ribbon about two inches wide and a yard and three-quarters long was selected to make this bow; but any fancy material, silk or velvet, may be used by cutting bias strips for the loops, and either fringing the edges or lining them. The bow is arranged in front of the braid, puffs or comb worn in the hair, with the loops extending backward, around and over the *coiffure*, which should be small and close at the top when the bow is worn. Make the bow of broad, rich ribbon on a foundation of lace or crinoline, to the ends of which add illusion or tulle, ornament the top with an ostrich tip or two, or a mass of roses, and behold, your Alsacian bow is transformed into a most charming evening bonnet.

6549

No. 6,549.—Ladies' Wrap.—The materials selected for this wrap were *Armure* silk and velvet, and the trimming consists of pipings, satin ribbon and French lace. Satin may be substituted for the velvet and gros-grain for the *Armure* silk. Spanish lace is very fashionable, and as a garniture is much more elegant than French lace. This wrap can be made up in any of the fashionable materials, and trimmed with pipings or plaitings of silk and fringe. Price of pattern, 30 cents.

No. 6,622.—Ladies' Basque.—Plain and striped goods are united in the construction of this basque, and the decorations consist of pearl buttons and pipings of the plain goods. Any two materials may be united in a basque of this style. The parts represented as plain goods, may be of cashmere or any woolen suiting and the striped parts of silk, satin or woolen material in contrasting shade. If washable textures are used, the striped portion may be of plain color and the remainder of figured material. Price of pattern, 30 cents.

No. 6543—Ladies' Princess Walking Skirt.—This skirt is noticeable for its completeness, as it includes not only the skirt proper but also a handsome overskirt drapery permanently attached. The prevailing taste for contrasts and combinations is very tastefully exemplified in this garment, there being plain and striped goods united in its formation. The little *tablier* pieces down the front are bordered with narrow plaitings of plain goods at their lower edges, and are among the most effective decorations that can be suggested. This style of skirt is admirably adapted for the



No. 3.

remodelling of two partly worn dresses. Price of pattern, 35 cents.

No. 3.—Skirt Decoration.—This flounce is cut crosswise of the goods, and after the width of the double plait has been decided upon, the top is cut in the manner represented, so that the top of the outer plait is in the form of a scollop. The distances may be first calculated by folding a piece of paper in two or three plaits of the desired size, cutting the scollop in each, and marking the edge of each plait and where the edges are to come when the plait is made; then unfolding the paper and duplicating upon cloth the marks made and the scollops cut, the plaits may be correctly calculated. Then, after the top of the flounce is lined with silk, velvet or a contrasting color, the plaits may be formed. Each scollop is turned down on the outside and tacked to position after the flounce has been attached to the skirt.

No. 4.—Skirt Decoration. The flounce is cut bias and from fifteen to eighteen inches deep when it is to form all the trimming except a heading. At intervals of three or four inches tiny shirrs are made in tuck style from the top to about half the distance to the bottom and drawn just enough to to produce a wrinkled appearance. Any heading desired may be used.

In our issue of April 26, will be given a review of fashionable goods with prices.

CORRESPONDENT'S CORNER.

This "Corner" is designed to promote sociability among our readers. They are to feel at liberty to ask any questions that may suggest themselves and it is desired that the answers be made by some of the readers, and not by the editor.

C. L. A., Felicity, Ohio, wants the sequel to "Betsey and I are Out." Will some reader oblige him by sending a copy of the verses to Literary Editor?

A Rural Reader, Alabama, asks that cuts of fashions suitable for washing-goods, may be published. In our issue of May 10, the desired cuts will appear.

Mrs. J. E. S., Tompkins Co., N. Y., says: "I had become very much interested in Margaret B. Harvey's most excellent letters, I am hoping she will tell us how to do *plain netting*. I understand the various kinds of filling in, but do not succeed in making the foundation.

A Reader, Nunda, N. Y., asks that "Rock Me to Sleep, Mother," may be published, and suggests that perhaps some of our readers will supply us with a copy of the poem.

Mrs. Annie Wittenmyer of Philadelphia, President or the Woman's National Temperance Union, lectured before the ladies of Binghamton College last week, organizing about a hundred of them into a Young Ladies' National Temperance Union, before leaving the College, including seventeen seniors and forty-two juniors.

Literary Miscellany.

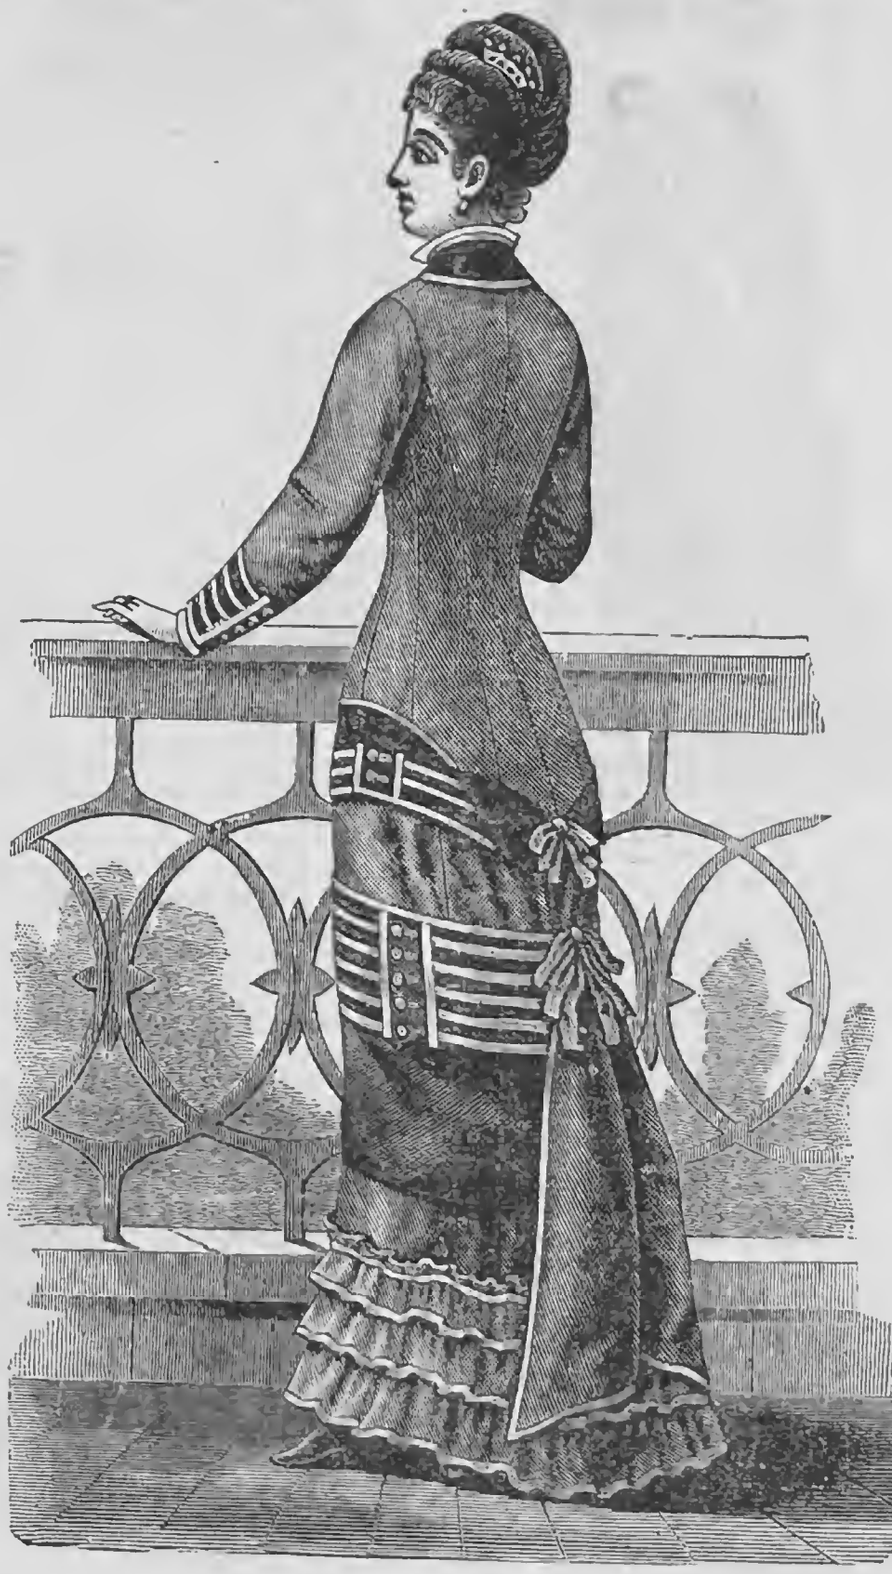
AN UGLY GIRL.

(Continued from page 238.)

CHAPTER IV.

NOEL MEDITATES UPON HIS POSITION.

When Mrs. Estcourt had been taken upstairs, and Mr. Whitely, with many expressions of regret, had departed to fulfill his long-deferred engagement, Noel found himself at last alone, and was unutterably thankful for it.



No. 1.

It would be absurd to pretend that he was reconciled to his disappointment. The late Lord Carisforde's will could only be characterized as an egregious blunder, if not positively an injustice to his heir-at-law, who, by all the rights of equity, ought not to have been left without the means of supporting his rank. As to the proposed union of the peerage and estates by the marriage of their inheritors, this Noel stigmatized as the greatest absurdity of all, an idea that could only have emanated from the brain of a man who had outlived all youthful feelings. No one else would have proposed to atone to his daughter for years of neglect by giving her his all, if at the same time he enjoined her to marry a man she had never seen, and of whose fitness or unfitness to espouse her he could know nothing; while, on the other hand, though he certainly showed Noel how he could exchange his landless condition for one of great riches, he seemed to ignore that the way in which it must be accomplished was one that only an unprincipled knave could adopt.

"What ought I to do next?" he asked himself. "As circumstances compel me to throw myself and Mrs. Estcourt on Miss Carisforde's hospitality, I certainly ought to apologize to her for it. But how? Through the housekeeper or by letter? or would it be better to ask for Miss Hillian Gray, and explain to her how awkwardly I am situated? A message through a servant might be misconstrued; a note to a young lady I have never seen is not easily written; while to that quiet little companion I could say enough to set Miss Carisforde's mind at rest, if she is inclined to fancy that I am stopping here with an unworthy motive."

6549

Still Noel hesitated awhile, wishing he had had the presence of mind to request Mr. Whitely to do this for him, and finally rang the bell, and desired the footman who answered, to inquire if he could have five minute's conversation with Miss Gray While waiting for the lady to appear, Noel continued his meditations on the peculiar situation in which he was placed.

There was something so ludicrous in this sudden transition from poverty to a peerage, and *vice versa*, that Noel—half in mirth, half in bitterness—laughed aloud; then as the sound echoed through the lofty room, he bit his lip at his own folly, glanced sharply towards the door, and saw Hillian Gray standing at no great distance.

"I beg your pardon, Miss Gray," he stammered, as he hastened to place a chair for her, a civility she declined, preferring to retain her former attitude. "My mirth must have sounded strangely ill-timed; but you must remember that the ancient sages took two views of the trials that beset us—the sad and the ludicrous; just as you found me I had inclined to the latter."

"It is fortunate that you can do so," she answered. "I hope you will not think me over-officious if I take upon myself to assure you that Miss Carisforde was as much surprised at the contents of her father's will as you were. It will relieve her very much to know that you are not so—so *cast down* by it as she feared you would be."

"I am obliged to her for the interest she testifies in me," answered Noel, with some constraint; "but it does not require any very great amount of fortitude to resign what one has never enjoyed, except in anticipation."

"But will you—can you bear so great a loss as this with philosophy?" she asked, wistfully.

"I'll try," said Noel, affecting more cheerfulness than he felt. "I shall tell myself that I am spared many temptations, or setting aside all pretence of indifference to so great a loss, try to remember always that it would be folly to grieve over what cannot be altered."

"It is a pity, a great pity," cried Hillian abruptly.

"What is? My escape from the snares of wealth?" asked Noel.

"No; I was thinking of Miss Carisforde. If she had died in her infancy, as every one about her hoped she would——"

But Noel checked the impulsive speaker.

"Pray do not say that! Who knows but that she has been spared to rule over these estates more prudently than I should have done."

Hillian Gray shook her head.

"There are reasons why this would be impossible. Her responsibilities will be oppressive to her. She acknowledges this already.

"Because she is depressed by her father's death, and the fatigue of waiting on him. With the aid of an experienced steward, she will easily keep her subjects in order. If she has a talent for governing, now will be the time for exercising it. If not, she must marry some gentleman who is her equal in fortune as well as birth, and be content to reign as vice-queen."

Hillian winced.

"Miss Carisforde married! Ah! the jest is too—

too hideous! You are ungenerous, sir, to forget her afflictions, and to speak thus to *me!* Pardon me if I leave you!"

And she retreated without bestowing another glance on the disconcerted Noel.

CHAPTER V.

NOEL APOLOGISES.

The door was closing on the departing form of Hillian Gray, when the young man, recovering his presence of mind, darted in pursuit and laid his hand on hers.

"A thousand pardons, Miss Gray, he breathlessly exclaimed. "You have misunderstood me, you have, indeed! Pray, return. I spoke thoughtlessly, but no covert insult, no impertinent jest was implied in my words."

"But you spoke of Miss Carisforde marrying," retorted Hillian, permitting him, however, to lead her back to the room; "and spoke as lightly as if you did not know that even the man who has been offered with her hand the inducement of a splendid fortune instantly rejected the bribe with horror, and preferred poverty to such a bride."

6522

Noel colored at this significant reminder, but his answer was prompt and frank.

"Here again you have misunderstood me. Had Miss Carisforde been as beautiful as an angel, I should have acted in precisely the same manner. My objection was not to the lady, but to the monstrous profanation such a marriage between two persons who are total strangers to each other, would be. I do not prefer poverty to wealth, Miss Gray, but I should loathe myself if I gained my riches by taking false vows at the altar."

Hillian Gray's pale cheek flushed, and she nodded approval.

"You have decided just as I think I should have done—just as I fancied you would. Miss Carisforde will be pleased to know that you had higher motives for avoiding her than a mere repugnance to behold one so afflicted. You will believe my assurances that she was not in fault concerning the will?"

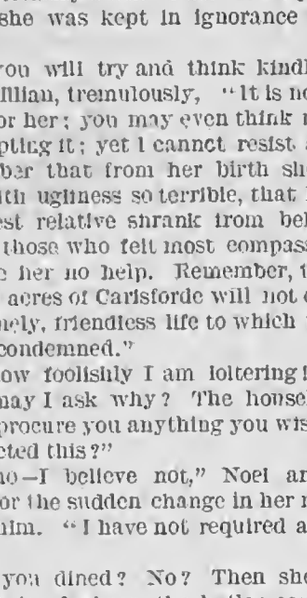
"Most certainly I will—I do. Have you not told me that she was kept in ignorance of its contents?"

"And you will try and think kindly of her?" pleaded Hillian, tremulously, "It is not my place to plead for her; you may even think me officious for attempting it; yet I cannot resist asking you to remember that from her birth she has been banned with ugliness so terrible, that her nearest and dearest relative shrank from beholding her face, and those who felt most compassion for her could give her no help. Remember, too, that all the broad acres of Carisforde will not compensate for the lonely, friendless life to which this unhappy girl is condemned."

"But how foolishly I am loitering! You sent for me—may I ask why? The housekeeper has orders to procure you anything you wish for. Has she neglected this?"

"Yes—no—I believe not," Noel answered, at random, for the sudden change in her manner had confused him. "I have not required anything for myself."

"Have you dined? No? Then she has been neglectful, for Jephson, the butler, says you have not touched anything but one glass of sherry since you came. It shall be attended to. I will go and speak to her."



6522

Again Noel had to explain and apologise. He ought not to have detained Miss Gray so unconscionably, but he could not feel easy till he had asked her advice; and then he proceeded to set before her his dilemma. The medical man, hastily summoned to Mrs. Estcourt's assistance, had pronounced her too ill to be removed, yet thus to trespass on Miss Carisforde's hospitality——

He paused, and Hillian Gray's lips parted into a slight smile.

"I don't think you have experienced much of that, have you? In the first place she did not know she was to be mistress here, so she would not take upon herself the duties of hostess; and now that she finds that they have devolved upon her, she feels incapable of fulfilling them, especially to a lady guest."

Noel colored.

"Then you advise me to remove my mother, at all risks."

"Oh, no! What have I said?" cried Hillian Gray, looking startled and uneasy. "I am afraid I am a sad bungler. Miss Carisforde would be vexed indeed if you did that. She would like you to remain as long as you feel inclined, only she hopes you will not think her discourteous if she continues to seclude herself in her own apartments."

"It is not a question of inclination," Noel gravely replied. "I should prefer to quit Carisforde Park at once. I shall most certainly do so to-morrow morning if I may leave Mrs. Estcourt here until she is sufficiently recovered to follow me."

"Oh! please don't!" cried Hillian Gray, with a look of genuine alarm. "Pray stay till she is well enough to go too! I beg your pardon," she added, penitently, when she saw Noel's face flush, "I am afraid what I have been saying sounded very rude; but you know Mrs. Estcourt resented my presence this afternoon, and—and, honestly, I shall be afraid to encounter her if you are not by."

"I could not ask you to pay any attentions to a person who has treated you so discourteously; but the housekeeper——"

"Impossible!" was the prompt reply. "Miss Carisforde's guest cannot be left solely to the care of her servants. That would be a greater discourtesy than any I have encountered. If Mrs. Estcourt remains, I must do my best to perform the duties delegated to me; but if you would stay and help me, it would be such a relief."

Noel could scarcely help laughing, though it was irritating to find that his step-mother had created such a very disagreeable impression. However, he could not wonder that timid, sensitive Hillian Gray, thrust by the infirmities of her lady into a position for which she was ill-fitted, should dread being compelled to play the hostess to a person who had treated her with marked ill-breeding.

"I am in a very awkward position, Miss Gray. If I pleased myself I should return to London this evening; but I cannot burthen you with the charge of a sick stranger. I will, therefore, crave Miss Carisforde's hospitality for this one night, and hope that to-morrow Mrs. Estcourt will be well enough to bear removal."

"Thank you," said Hillian, simply. "The house will not seem so lonely when I wake in the night and remind myself that you and Mrs. Estcourt are here. For the last few days the silence, the gloom has been almost intolerable. Good evening, sir; I ought to say my lord, but I cannot bring my lips yet to giving you the title by which I have been accustomed to address another."

"Pray do not apply it to me at all; I shall never adopt it. It would be a mockery to call myself anything but Noel Estcourt."

6543

Hillian regarded him sorrowfully, mused awhile and then came back from the door to whisper, timidly:

"May I tell you what I know to be in Miss Carisforde's thoughts? She is meditating offering you half her fortune. You would accept that, wouldn't you?"

Noel shook his head.

"Miss Carisforde is very liberal, but she is not of age; she cannot carry out her generous intentions, nor could I consent to avail myself of such an offer. Pray make her understand that I am very proud and obstinate, too much so to take from a woman's pity aught for which I could proffer no equivalent."

"After all, it is *not* nice to be rich," Hillian Gray concluded. "Ada Carisforde would have been happier if her father had left her a respectable annuity, and let the estates go with the title."

"Is it any use dwelling on this?" asked Noel, impatiently, for the subject was a sore one.

"I suppose not, only—I am very, *very* sorry for you."

She said this so sweetly, that Noel raised to his lips the hand she tendered, an act of gallantry that drove her—blushing and embarrassed—from the room.

(To be continued.)

GEN. LEE asked a straggler one day, whom he found eating green persimmons, if he did not know they were unfit for food. "I'm not eating them for food, General," replied the man. "I'm eating them to draw my stomach up to fit my rations."

VETERAN AND RECRUIT.

E. W. HAZEWELL.

He filled the crystal goblet
With golden-beaded wine,
"Come, comrades, now, I bid ye—
'To the true love of mine!'

"Her forehead's pure and holy,
Her hair is tangled gold,
Her heart to me so tender,
To others' love is cold.

"So drain your glasses empty
And fill me another yet;
Two glasses at least for the dearest
And sweetest girl, Lisette."

Up rose a grizzled Sergeant—
"My true love I give to thee;
Three true loves blent in one love,
A soldier's trinity.

"Here's to the flag we follow,
Here's to the land we serve,
And here's to the holy honor
That doth the two preserve."

Then rose they up around him,
And raised their eyes above,
And drank in solemn silence
Unto the Sargeant's love.

WEAKER THAN A WOMAN.

(Continued from page 239.)

CHAPTER XLVII.

His face softened into deepest tenderness as he looked at her. The old love so long trampled down and repressed seemed to leap into new and vigorous life.

6543

"Never again!" she repeated. "I love you—and I would be true to you!"

"Then give me a proof. I hate this wealth for which you forsook me! I hate this splendor and magnificence for which you bartered your truth and fidelity! I will never benefit by them. They robbed me of you, they destroyed the best part of my life—I will have none of them! No man shall say of me that I profited by your falsehood and enjoyed the price of your sin—for it was a sin, Violet. Listen to me, my darling. This is what my honor dictates—and my honor is dearer to me than my life. I love you, and ask no higher gift from Heaven than to call you my own; but you must come to me unfettered by dead Sir Owen's wealth—I will have none of it! You must give up your mansion, your jewels, your servants—all the magnificence furnished by him. I will provide a beautiful house for you—not grand and stately like this, but a home that shall be a heaven of love. You married for money, Violet—money did not bring you happiness. Now marry for love—that will."

She looked up to him with a bewildered air.

"I do not understand. Do you mean that I am to surrender all the fortune my husband has left me?"

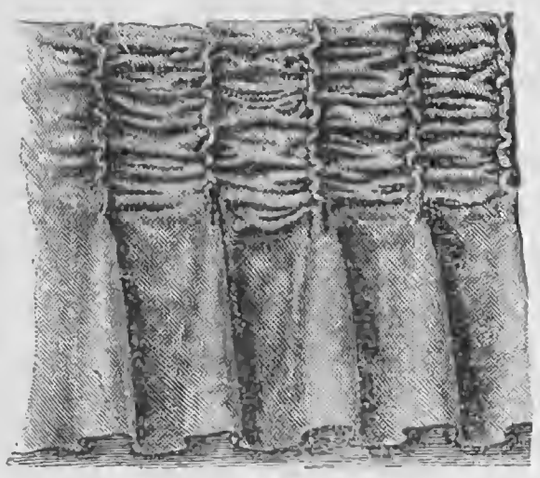
"I mean just that, Violet; I will never share it."

"But Felix," she said, "that would be absurd, now that it is all mine to do as I like with. What could I do with it?"

"Build hospitals, churches—anything you like, except keep it."

She looked at him thoughtfully.

"Do you not think that that is very hard?" she said.



No. 4.

"No, I do not; to share it, to benefit by it, would seem to me like sharing a sin. There is the true test of love, Violet. I forgive with all my heart the fault that you say was committed in the thoughtlessness of youth—now I give you the chance of redeeming it. Give up the wealth that tempted you to do me wrong, and I will bless the day that brings you to me again."

He looked at the diamond necklace she wore; unclasping it, he laid it upon the table.

"Your neck is a thousand times more beautiful," he said, "without that circlet. Can you give up all such deckings, Violet?"

"It is such a thing to ask me," she said.

"It is a true test of love. You had to choose once before between me and money—then you chose money. I place the two before you again—which will you choose? You cannot plead youth, or ignorance, or vanity, or even undue influence now. You have learned many things; and I say this is a true test of love. But, Violet, it is not fair to ask you to decide hurriedly—take time over it. It is much to ask, I know; but I offer something better in return—and you shall never repent the sacrifice."

"All the world would laugh at me," she said.

"The world would say you had given up all for love. But, Violet, mind, I do not wish to persuade you. I leave the decision to yourself. For the second time in your life you have to choose between love and money. Ponder it, and tell me in a few days what you have decided upon."

She looked up at him wistfully.

"Is that your final decision, Felix?" she asked.

"Yes, I cannot change it, Violet. Most men make an idol of something; my idol is self-respect," he replied.

"Could you not make an idol of me?" she whispered.

"Yes, if you are not framed in a gold setting," he answered.

She was silent then for a few minutes, while the firelight played over her golden hair, and he drew the long shining tresses through his fingers. She laid her head on his breast and closed her eyes.

When she raised her eyes to his, they were wet with tears.

"Felix," she said, "I must go now; it is growing late. Will you kiss me before I go?"

He bent down and kissed the lovely face—not once, but many times. Then she rose to quit the room. He remembered long afterwards how she kept her eyes fixed on his face until she reached the door.

"Good-bye, Felix," she said—and the very tone of her voice was like a sigh.

He had kept himself outwardly very calm during the interview. Violet did not know what a terrible tempest was raging within him. He threw aside paper and pen when the door was closed.

"I can write no more!" he said.

His heart beat fast and his brain seemed to be on fire—every pulse throbbed wildly, every nerve was strained.

"I must go out into the air," he told himself; "these walls are stifling me."

He went out through the window; and he spent the night as he had spent many another, in walking rapidly, so that he might beat down the temptation that was come to him.

For it was a temptation. So loving and so lovely, so gracious and fair, was Violet that he could have clasped her to his breast, and have cried out in rapture that she was his. But honor stood between them. He would never accept the dead man's gold.

In the morning he did not see Violet at the early breakfast. Miss Hethcote came down and made tea. Lady Chevenix had sent her, she said. She did not seem quite well. Miss Hethcote looked inquiringly at Felix, as though she would fain ask what had passed between them; but no word was spoken, and Darcy Lonsdale left Garswood quite unconscious that it had been offered to his son.

The next two days were days of torture to Felix. How he passed them he never knew. On the third came a letter in the well-known hand-writing, with the faint familiar odor of violets. He knew it was Violet's answer; and, though he was a strong, brave man, he trembled to open it. Within that folded paper lay the words that might effect the whole of his future life. Either Violet had written to say that for his sake she would give up wealth, luxury, and magnificence, or she had decided on giving him up to retain that to which perhaps her heart clung.

"It was the only test," he said, as he took the letter in his hand.

CHAPTER XLVIII.

This was Violet's response to Felix Lonsdale's request about dead Sir Owen's wealth—

"My dear Felix,—I have thought well over the matter recently discussed by us, and I have decided. I know that I am weaker than a woman—but I cannot give up my fortune. It seems to me such a foolish thing to do. After being accustomed to every luxury, I could not give it up. I love you, and shall always love you; but the test was too hard. I have pictured myself back in the old scenes, leading the old life, and I could not undergo it. I would most cheerfully share all I have with you, but I cannot give it up for you—do you think it was quite right to ask me?

"I do not suppose I shall ever be happy—but you will. I am not noble enough for you; and if you had married me, your disappointment would have been great. You will meet some day a noble woman whom you will love and marry, I know that, in saying 'good-bye' now, I say it for ever; but forever I shall be your unhappy "VIOLET."

He laid the letter down and looked at it. He had almost expected such an answer, yet his disappointment was great, and his eyes filled with tears. It had been very sweet and very dear to him, this precious love-story—and the end was sorrow; still he could not be surprised.

"She has chosen that which she loves best," he said; "and I cannot blame her now. I must try to forget her."

He did it bravely, as he had done it before. He threw his whole heart into his work, and fought inch by inch with the great master-passion of his life.

For some time after that it was rumored in Lil-

ford that Lady Chevenix was not well; that she had lost her color and her spirits; that she was ill and saw no one. Then quite suddenly she sent for Darcy Lonsdale, and told him that she had come to the conclusion that the air of Garswood did not suit her; that for the future she intended to divide her time between London and Paris. To his surprise, she added that the Marquis of Renmore had offered to buy the Garswood estates, and that she thought of selling them to him; but it would be only on condition that he retained Darcy Lonsdale as his agent.

After some months, during which Lady Chevenix and Felix never met, this was accomplished; but her ladyship's removal was prevented for a time by the sudden death of Francis Haye. Then Mrs. Haye sold the Limes and went away with her daughter. So it came to pass that, before six months were over, the names of Chevenix and Haye were no longer to be found in the county.

Great had been the surprise. The whole neighborhood was stirred. It was much to be regretted that such a change should take place. But Lord Arlington and Captain Hill said gravely that it was the best thing Lady Chevenix could do. She had suffered much at the Hall—she would probably begin quite a new life in an unfamiliar place.

The new occupants of Garswood—the Marquis of Renmore, with his two maiden sisters and a large household of servants—gave more satisfaction to the public in general than the wealthy Baronet had done. It was an excellent agency for the Lonsdales, who, by dint of industry and perseverance, were rapidly amassing a fortune. Darcy was growing old, and did not go so often to the office. The "small army" were rapidly growing up. Everything was prosperous and happy where so many trials had once seemed to threaten general destruction. Kate was one of the leading ladies now in Lilford—and very much she enjoyed the position. Time had softened Miss Lester, while Eve had grown more beautiful.

Felix worked on steadily. He still made his home with his father; but Katie, in speaking of him, said, with tears in her eyes, that some day Providence would reward him for his goodness to them, and that he would find a wife worthy to be his partner for life.

He went to see Evelyn when he had an hour to spare; they were the best of friends. Years afterwards he saw how she had guided him without ever seeming to advise—how she had influenced him without ever seeming to use her influence; and when he began the great battle of political life she was his right hand.

The time that had been foreseen and prophesied had arrived. The borough of Ordstone was vacant, and through the interest of Lord Arlington, Felix had been returned.

It was no surprise, for every one had prophesied it. Genius must and will make its way to the front when it is allied with perseverance and industry; genius alone does little.

"M. P. for Ordstone." Felix Lonsdale was pleased—he exulted as men exult. He had now a foremost place—he had made a name. Like all other men worthy of anything, he was ambitious; and it seemed to him that his ambition would be realized.

On the evening of the day of his election it was some relief to him to escape from the noise of the crowd, and spend a quiet hour with Evelyn. How she rejoiced with him! How she exulted in his success! How wise and sweet she was in her counsel! It seemed to him as though his soul had found one more than a friend.

"My foot is on the first step of the ladder. Eve, how high shall I climb, do you think?"

He never forgot the beautiful earnest look on her fair face as she answered—

"As high as heaven, I hope."

And those few words, spoken by the tender lips of a noble woman, were to him like an eloquent sermon. From that hour his life seemed to have higher aims; and into it came no dream of love, until one day, Katie having some leisure, had a long conversation with him."

"Can you understand an allegory, Felix?" she asked him."

"Yes, I think so," he replied. "Try me, *madre*."

"There was once a man," began Kate, "who stood with his feet firmly planted upon the earth and his eyes very often looking up at the clouds. At his feet lay a most beautiful pearl of priceless value, and at a distance lay a worthless piece of shining glass. This man of whom I speak trod upon the pearl until it was almost hidden in the dust, while he went eagerly in search of the bit of glass. Do you understand, Felix?" she asked, after a few minutes,

"Only very vaguely, *madre*. I am the man. I recognize the bit of shining glass but not the pearl."

"Not the pearl!" repeated Kate. "Well, that proves what I have often thought, that, while men may be clever and keen and intellectual, they may, at the same time, be blind as bats. That pearl has been under your eyes for many years. Ah, I see you do not understand!"

Nor did he. Kate went on talking to him.

"You will be a man of mark, Felix—every one says so. But you will be like all other men; you will want a good wife. If the facts could be got at, it would be found that some of the greatest men of the day owe much of their fame to the wise guidance of a wise wife."

"I believe that," he replied; "but—ah, well, we need not talk about it, *madre*. I suppose a man's fate is settled for him."

"A man's fate is just what he likes to make it," declared Kate, "When you are inclined to marry, never mind beauty; look out for a noble woman—nobility of character is far better than beauty."

The words struck him as being but the repetition of other words written to him.

"The world is full of noble women," Kate continued. "Look at Eve Lester, Where would you find one sweeter, more gracious or noble? She is true and tender and earnest; she has a fund of clear, common sense; she has a vivid, bright imagination, a quick, poetical fancy; and, as for beauty, I see more in her sweet fair face than in any face I have ever seen."

"Eve Lester!" he cried. "Certainly no woman could be nobler. Oh, *madre*, is she the pearl?"

"Yes, you most blind, most dear, most obtuse of good boys! She is the pearl, and you never saw her in your hurry to pick up the worthless shining colored glass."

Eve Lester. How blind he had been! He looked up at Kate.

"Do you know, *madre*," he said, "she has been so much part of my life—all my life—that I have never thought of her apart from myself."

A wise woman always knows when she has said enough. Kate turned the conversation; nor could he persuade her to say more about Eve. But the idea had taken hold of him; and Kate smiled softly to herself on seeing how deeply he was engrossed in thought during the remainder of that evening.

Felix had never realized until then what Eve was to him. He went back over all his life. She had been his adviser, his counselor, his friend. She had aroused all noble thoughts in him, all great desires, She had fired his ambition; she had shown him his road in life. He had never dreamed how much he owed to her influence until he thought all this over.

He remembered how, in the darkest hour of his father's life, when earth was all cold, and the heavens seemed made of brass, she came to his house like an angel of light and consolation. She had offered him her all, and was honestly grieved because he would not take it. As Felix sat thinking of her, he recalled a thousand instances of her sweet wisdom and goodness.

"It is true," he mused! "we are sometimes perfectly ignorant of our greatest blessings. I should never have known all that Eve has been to me until I lost her."

Under this new light, he said to himself that he must see her, he must go over and talk to her, he must discover that she really was to him—how dear, how needful—and he would do it at once: there should be no delay.

He went the next day, and the result of their conversation was that he did not leave her until she had promised to be his wife; for he found out that she loved him, and had loved him only all her life—he found out that he had indeed been blind and foolish, for she was really the one great treasure of his life.

The engagement afforded the greatest of pleasure to all their friends; there was not one dissentient voice. And now indeed Kate Lonsdale was happy.

"I shall be the dowager Lady Lonsdale," she said to Eve, with a happy laugh. "There has been only one mistake from the beginning. Felix ought to have chosen you from the first."

Eve asked him one day—

"Why do you always call me 'Pearl,' Felix? It is not my name."

"It is my name for you," he replied, "and I shall use no other." But he never told her why; the past conversation between Kate and himself remained a secret.

There could have been no happier marriage. Felix had a beautiful house prepared for his wife—not the pretty cottage orne where his golden-haired love had stood and decided that it was not good enough for her, but a fair and pleasant mansion, standing in the midst of sunny grounds—a home that a princess might have envied because of its artistic beauty and bright aspect.

It was a quiet wedding, but Eve would have it so. She would have neither carriages nor a train of bridesmaids, nor children strewing flowers, nor any of the ceremonies that attend a country public wedding. She walked quietly to the dear old church at Lilford, looking very fair and sweet, with the light flush caused by the morning air on her face. The sunlight streamed in at the windows as she plighted her faith to the only man she had ever loved, and whom she was to love for ever.

Then Felix took her away to the Lakes, and they were very happy.

They were sitting one day on the border of Windermere, when Eve raised her sweet face to her husband and said—

"Felix you love me very much now?"

"Yes, my pearl—more than you know," he replied.

"Do you—do not be cross with me because I ask the question—do you ever think of Violet?"

He took her hands in his own and kissed them.

"Listen, darling," he said. "I will answer you in other words than my own—sweeter indeed than any words that I could say—

"'Within the kingdom of my soul
I bid you enter, love, to-day—
Submit my life to your control,
And give my heart up to your sway.

"'One only thought remains apart,
And will for ever so remain;
There is one chamber in my heart—
There even you might knock in vain.

"'A haunted chamber, long ago
I closed it, and I cast the key
Where deep and bitter waters flow
Into a waste and silent sea.

"'Dear, it is haunted. All the rest
Is yours; but I have shut that door
For ever now. 'Tis even best
That I should enter it no more.

"'No more. It is not well to stay
With ghosts; their very look would scare
Your joyous loving smile away—
So never try to enter there.

"'Check, if you love me, all regret
That this one thought remains apart;
Now let us smile, dear, and forget
The haunted chamber in my heart.'"

When he had finished, he bent down and kissed the fair face, and Eve, knowing the way to his heart, said—

"I am quite content, and I can trust you."

And they talked of other things, while the sun shone over the lake and the birds sang their sweetest. THE END.

A HAPPY CONCEIT.

When to the flowers so beautiful
The Father gave a name,
Back came a little blue-eyed one
(All timidly it came),
And standing at its Father's feet,
And gazing in His face
It said, in low and trembling tones,
"Dear God, the name thou gavest me,
Alas! I have forgot!"
Kindly the Father looked him down
And said, "Forget-me-not"—
"My Peach Bud."

[*From the Golden Era.*

UNITED THEY STOOD.

The Only Day Upon Which the Americans and English Fought as Allies.

An English paper published in Shanghai, China, gives this reminiscence: Thursday, the 4th of April, was the anniversary of the battle of Muddy Flat, which occurred in 1854, and is, we believe, memorable as the only occasion when the American and British flags were united or allied against an enemy. The volunteers' flag, destroyed at the fire at the British consulate, bore these words: "4th April. Defence not Defiance." Few remain now in Shanghai who were present and took part on that memorable occasion, and a few scraps from memory of the event may not be uninteresting to the volunteers of the present day. For some time previously the Imperialist soldiers (or as they really were—rabble) were encamped outside the Defence Creek, their camps extending from the Joss House at the Soochow Creek nearly up to the turning of the race course at Probst's Garden. They had made several fruitless attempts to drive the rebels from the city.

The Imperialists were, however, a continual source of annoyance to all foreigners, for as their encampment was on the edge of the creek they would insult foreigners and even ladies while walking on this side of the creek. They for several days cut off our market supplies, compelling us to fall back on Crosse & Blackwell. Notwithstanding repeated remonstrances from the consuls to the Chinese commanders, they refused to retire to a distance, or stay their insults or encroachment. One source of great danger was, that they used to place their targets for ball practice in such a position that the ball would come hissing near the persons of foreigners while taking exercise on the road. At last, becoming emboldened, they assaulted a lady while being carried in a chair, and wounded her husband, and it was determined to expel the intruders by force. It was, therefore, arranged by the American and British Consuls that they should unite their forces, call out the volunteers and all foreigners to assist the naval force to drive away the Imperialist army.

The volunteers to a man turned out under Captain Wade, then her Majesty's vice-consul. The force, under the command of Captain O'Callagan, of the Encounter, and Captain Kelly, of the Plymouth, marched out to the spot on the Maloo, between the Racket Court and the old Grand Stand, the American force taking ground where the municipal stud are stabled. It had been duly notified to the Imperialist commander that they would be given up to three P. M. to move off, but as there were no signs of their complying, at the moment of three o'clock, as if by magic, a shell from each gun fired by the American and English forces fell bursting into the encampment, a general stampede followed, and the country to the westward, so to speak, blackened and blued with the figures of hurriedly retreating soldiers. Not one of the foreigners had the slightest idea that the camp contained so many soldiers.

After the first shelling, when the soldiers had apparently evacuated the position, the foreign forces approached the works; in doing so they were fired upon by the soldiers stationed at the guns pointing from concealed port-holes, when Mr. Gray, of Russel & Co., was wounded, losing a leg. Captain Pearson, of the American ship Rose Standish, received a mortal wound in the face. The carpenter of her Majesty's ship Encounter was killed, also a seaman of the United States ship Plymouth. Mr. Brine, an English merchant, one of the volunteers, received a mortal wound in the head. Some minor casualties were also received. It was not ascertained how many men were killed of the Chinese. Their encampments were completely destroyed. In consequence of the determined action of this handful of foreigners, the Chinese commander considered it prudent to move off to a more respectful distance. The whole affair was very pluckily carried out. About 400 foreigners in all bravely left their houses, and attacked, it was estimated, about 15,000 Chinese intrenched with several large guns in position. And so vast the number of Chinese who followed the rear of the foreigners, and remained between them and their homes, that, had they had any sympathy for their countrymen they had only to oppose their return, and the foreigners would have been attacked front and rear, and not one could have escaped. The rebels, seeing the success of the foreigners, came out and completed the destruction of the encampment.

SCIENCE GOSSIP.

The Milk of the Cow Tree.—Alexander Humboldt remarks that among the many very wonderful natural phenomena which he had during his extensive travels witnessed, none impressed him in a more remarkable degree than the sight of a tree yielding an abundant supply of milk, the properties of which seemed to be the same as the milk of a cow. The adult Indians would go each morning with their slaves from the village or station on the slope of the mountain chain bordering on Venezuela, where Humboldt was stopping, to a forest where they grew, and, making some deep incisions into the trees, in less than two hours their vessels, placed under these incisions, would be full. All present would then partake of the milk, on which the slaves grew fat, and a quantity would be carried home to be given to the children and to be mixed with cavassa and maize. The tree itself attains a height of from 45 to 60 feet, has long alternate leaves, and was described by Linden as *Brosimum galactodendron*. The milk which flows from any wound made in the trunk is white and somewhat viscid; the flavor is very agreeable. Some time ago, on the occasion of M. Boussingault going to South America, Humboldt requested him to take every opportunity of investigating this subject. At Maracay the tree was first met with, and for more than a month its excellent qualities were daily tested in connection with coffee and chocolate; but there was no opportunity for a chemical analysis. Nor does such appear to have occurred till the other day, when amid many curious things exhibited by the Venezuelan Government at the Paris Exhibition, there happened to be several flasks of this milk, and after a long period M. Boussingault has been enabled to complete his analysis of this substance, which is unique in the vegetable world. In a memoir laid before the Academy of France he gives a detailed analysis, and concludes by stating that this vegetable milk most certainly approaches in its composition to the milk of the cow; it contains not only fatty matter but also sugar, caseine and phosphates. But the relative proportion of these substances is greatly in favor of the vegetable milk, and brings it up to the richness of cream, the amount of butter in cream being about the same proportion as the peculiar waxy material found in the vegetable milk, a fact that will readily account for its great nutritive powers.

What comets may really in structure and character be, remains almost as difficult confidently to state as it was two centuries ago. That they are not solid masses every one is agreed. It seems probable that even the nucleus, when brightest and apparently most condensed, is, if a single body, a quantity of glowing gas, not a solid or even a liquid substance. It is remarkable that not only the tail, so called, but even the nucleus itself, is as a rule so thin that a bright star can be seen through it scarcely dimmed. What the tail may be is even more perplexing than the question of what the head and nucleus of the comet may consist. The tails have sometimes extended over more than a quarter of the heavens; that is to say, have reached from the zenith to the horizon, and from their ascertained distance have been calculated to occupy a length of not less than ninety millions of miles, or very nearly the distance of the earth from the sun; so that when the head of the comet was passing the sun in his immediate neighborhood, the extreme end of the tail might be almost in the immediate vicinity of our planet.

A correspondent of the London Garden says, "Many years ago a friend gave me a simple receipt for ink for writing on zinc, which I have constantly used since. It is twelve to sixteen grains bi-chloride of platinum dissolved in one ounce distilled water. If kept corked, a small bottle will last many years. The zinc labels must of course be cleaned before using. This is readily done by rubbing either with fine emery paper or with very dilute oil of vitriol. Then simply write the name and allow the ink to dry. I have used labels of this description for years, and have never lost a name since adopting them. They have been found equally suitable for the house or the open air."

A valuable glue can be made from chestnuts by freeing them from the shells, grinding the kernel into a flour, mixing it well and washing in water and passing through a sieve. The fine floury mass so obtained is washed in clear water several times and allowed to settle. The sediment or starch thus deposited is dried in the air, and again treated with chlorine water, washed again and made into a glue similar to that made from starch. The advantage of this glue is that it will retain its liquid state even at a cold temperature, while common glue must have a constant fire to keep it ready for use.

A hint to those who may have occasion to break up stone or use stone-breaking machines may be found in the announcement by Tournone of the result of certain experiments in regard to the crushing of stone. In the experiments with chalkstone dried in the air and wet, it was found that the ratios of crushing force required were in the proportions of 36, 23 and 18. Another experiment gave 36, 23 and 12, and still another gave 52, 26 and 21. It will thus be seen that by wetting the samples the force required for crushing was considerably reduced.

A new method of treating fish has lately been patented by Mr. Samuel Bliss, of Chicago, the object of which is to preserve the fish with a less quantity of salt than is usually required. This consists in the addition of a little glucose to the salt, by means of which fermentation or any souring or putrefaction is said to be readily prevented, and without imparting any taste to the flesh. It is claimed that no matter how long the meat is kept in the pickle, it will be sweet and retain much of its original flavor.

The application of the cones of certain species of pine in tanning has lately been made very advantageously in France, the leather prepared with them being in every way equal to that in which oak bark has been employed. These cones are gathered in the pine plantations, and quite a limited district has furnished one hundred tons annually.

"Sympathetic pipes" are a recent novelty. The bowl of a meerschaum may be colored in five minutes, by first tinting it with a solution of nitrate of silver in ether and alcohol, to which essence of roses and camphor are added. Figures of any pattern are produced by the heat of the tobacco, and when produced are permanent.

A Boston telegraph clerk smiled when he gave a man this message from his wife: "Unto us a child is born, nine feet long by two feet wide;" but the man understood it meant that he should buy an illuminated Easter text.

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

LOG-CABIN SKETCHES; OR, JESSIE SEABRIGHT'S DIARY.—No. 4.

MAY MAPLE.

Self-Helpful Woman.

MARCH, 15, 18—Evening.

IT is something less than a month since Mrs. White came for the first time to spend the day with me. I think it will be a day long to be remembered; to her do I owe the suggestion, "Help thy neighbor, and in so-doing thou shalt help thyself." She is not without means, as so many are. But she has not one bit of ingenuity in her make-up. She cannot make herself comfortable without going directly to the market, upholsterer and mantuamaker; and in this country none of these is to be found. She knows nothing of self-reliance and is therefore dependent almost entirely upon hired help, and servants are not always prudent, especially with other people's property. I had heard of this lady long before I became acquainted with her; and sometimes had been selfish enough to wish that she were a near neighbor—she lived several miles from us—for I believed we might help each other.

She had not been in the house an hour before she said: "Mrs. Seabright, I wish you and your husband would come to my house and make me a couple of easy-chairs, like yours. I see you have half-a-dozen good enough for the President. I think your John must be a pretty good carpenter."

I very soon informed her that John had nothing to do with the manufacture of my easy-chairs.

"But you don't make the frames yourself?" When told they were old barrels and boxes, she fairly shook with laughter.

"Well, if you will come and make me a couple, I'll give you a dozen yards of good calico, and more if that does not pay you. I haven't had so comfortable a seat since we left our home in Ohio, two years ago."

Of course, I said that I would help her in any way I could. Yesterday I had an opportunity to ride over to Mrs. White's, and when I came away she had two handsome easy-chairs, and I was rich with my twelve yards of new calico and a bundle of half-worn clothes to make over for Bertie when he should need them, and some old, bright flannels which she said I could and would find use for; while if she kept them, they would be in the way and furnish food for the moths.

To-day I have made a lounge. Almost every day I thank my "lucky star" that I was a so-called hoiden in my youth; and learned, with my brothers, to use the hammer, axe and saw. How I wish girls were more frequently encouraged to use the tools of the carpenter and the farmer, instead of being ridiculed if they show any aptitude in driving a nail or spading a bit of ground. But my lounge! First a half-dozen sticks of wood, which chanced to be bird's-eye maple, were selected from the wood-pile. These were about fourteen inches long, and after they were hewn off smoothly, were about two inches square. These made three legs to each side; for, in the absence of boards, the rest of the frame must be made from my pile of "shakes" that was growing beautifully less; and, of course, it would take two lengths for a side, one at each end, and one in the middle for a brace. These pieces were nailed firmly to the legs; then some strips or cleats were placed lengthwise inside, an inch or two lower down than the top of the frame to serve as slats, which were also made of the shakes, sawed the right length, and then tacked to their places, and the frame was completed. Bertie claps his hands and hurrahs for "mamma's 'ittle bed-'ted."

A tick was quickly made of a coarse sheet; and then Bertie and I took a stroll down to the woods, basket and tick in hand; for I had neither sea-grass, hair, nor straw for a mattress. But there was plenty of nice long moss growing on the north side of the old forest trees. And this would make very good cushioning till we could raise some nice bright straw. The spring air was soft and balmy, and I fancied fragrant with the sweet odors of some far-off southern clime. My little boy and I really enjoyed the out-o'-door exercise; for while I gathered the long fringy moss from the stiff old dowagers and their liege lords, Bertie managed to put quite a quantity into the wide-mouthed sack; and it was not long ere we returned, he with the basket, and I with a well-filled cushion, which I doubted not might need refilling several times before the harvest. Now for the covering. My new calico was a neat, small figure with a brown ground, and would correspond very well with my chair covers. Two yards were torn off and then cut in two lengthwise for the valance. The raw edge was turned down, then laid in plaits and tacked to the upper edge of the frame work; another piece was torn off nearly the length of the tick and a strip six inches wide was sewed on around the breadth; the lower edge was fastened to the under side of the cushion with strong thread after the cover was put smoothly over it. When it was all completed, I viewed my handiwork with a good deal of satisfaction, and I must say pride. It was strong, looked neat and comfortable, and I knew it would be an excellent resting-place. And oh! how many times it would save me from mounting the ladder with Bertie in my arms, to put him to bed on a hot summer day. One thing still is lacking, and that is a pillow. I will make that to-morrow if the weather keeps fine, so that Bertie and I can go out to the woods for more moss.

"Jessie, why didn't you make this comfortable piece of furniture a long time ago?" says John, as he awakes from his evening nap and stretches full-length upon the lounge. "If you have any more such pleasant surprises, bring them along. I expect to come home some night from the woods and find our log cabin turned into a palace."

SOME OF THE MANY WAYS TO COOK SPINACH.

No. 1.—Wash and cook twenty minutes in salted water and then drain and chop fine. Put into a pan over a slow fire with a tablespoonful each of butter and cream, with pepper and salt to taste; stir constantly while heating. Turn over thin slices of buttered toast.

No. 2.—Boil, drain and chop same as in No. 1.; put back on the stove, with a spoonful of butter, and pepper and salt to taste; beat until hot and turn into a deep dish; cover with a dressing of the yelks of four hard-boiled eggs, rubbed and mixed to a paste, with a tablespoonful of melted butter, one of cream, and lastly one of vinegar. Spread this dressing over the top and garnish with a border of ringed whites.

No. 3.—While the spinach is boiling prepare a teacupful of butter beaten to a cream, after which add the raw yelks of two eggs, salt and pepper and a teaspoonful of made mustard; mix thoroughly and add a teacupful of thick cream. Stir this dressing with the chopped spinach; return to the fire to heat, being careful to take off just as soon as hot, that the egg may not separate.

No. 4.—Cook twenty minutes, drain and chop fine; return in a sauce-pan to the fire, with a tablespoonful of butter and three of good gravy; salt and pepper to taste. Stir lightly until quite dry; then fill egg-cups, which have first been dipped into hot water, with the mixture; press down and turn upon a flat dish. Place a slice of egg upon each cup-shape.

MARY B.

COFFEE EXTRACT.

ALLUDING to our remarks on the above named extract in RURAL of last week, a friend sends us the following:

"ESSENCE OF COFFEE.—A highly concentrated infusion of coffee, prepared by percolation with boiling water, gently and quickly evaporated to about ⅓ or ¼ its bulk, and mixed with a thick aqueous extract of chicory and sirup of burnt sugar, so as to give the whole the consistence of treacle. The proportions of the dry ingredients should be: coffee, 4 parts; chicory, 2 parts; burnt sugar, 1 part. It should be kept in well corked bottles in a cool place. This resembles the advertised essence of Dunn and other makers. It is convenient for extemporaneous coffee; but the beverage so made is inferior in flavor, aroma and piquancy to that made at home."

ANOTHER. — "SEARLE'S PATENT COFFEE.—This is prepared by evaporating skimmed milk mixed with 1-40 part of sugar, at a low temperature, and, when nearly solid, adding a *very concentrated essence of coffee*, and continuing the evaporation at a low temperature (in vacuum if possible) until the mixture acquires the consistency of sirup, (Coffee Sirup) paste (Coffee Paste), or candy (Coffee Candy.) The last may be powdered, (Coffee Powder, Dry Essence of Coffee)."

BARLEY FOR BUCKWHEAT.

MRS. COL. F. D. CURTIS, of Kirby Homestead, writes as follows to the N. Y. Tribune: "Baunocks o' bean meal, bannocks o' barley: Hey! for the Highland man's baunocks o' barley!" Burns believed in barley cakes, and so do we. It is now time to put buckwheat aside, and there is no better substitute than barley. They are light and wholesome. Dyspeptics who cannot digest buckwheat cakes, have no trouble with barley. They can be eaten all summer. Every farmer ought to sow a couple of acres in order to have barley flour, which will make a good saving in the cost of wheat, besides being more wholesome, especially for children. Barley and oatmeal are staples in every Scotchman's home, and help to make the stalwart forms and rosy cheeks which characterize the men and women of that land. Barley biscuit are nice and more healthful for supper than those made of wheat. Flour (the Colonel says so) will be high another year, and this spring is the time to prepare to supplement it with barley."

QUESTIONS ANSWERED.

Scrambled Eggs and Mending Crockery.

WILL you please give me through the columns of your department recipes for the above. ANNIE HOPKINS.

ANS.—For scrambled eggs: Have a frying-pan hot and buttered; break half a dozen eggs into a flat dish and carefully slip, without breaking the yelks, into the hot pan; sprinkle over a very little salt and add a piece of butter the size of a walnut. When the eggs begin to whiten, stir carefully from the bottom until cooked to suit. Care must be taken not to have the pan too hot. The mixture when done should be in large flakes of mingled white and yellow. Three tablespoonfuls of rich cream may be substituted for the butter.

To mend crockery: Lime and the white of an egg mixed thoroughly together make one of the strongest cements as also one of the easiest to apply. Shave off a small quantity of lime and mix only enough with the egg to mend one article at a time. Apply quickly to the edges and place firmly together when it will very soon set and be strong.

Blue on Cotton.

I took the recipe for coloring blue on cotton to my brother, who is a druggist, and he did not know which of the two kinds of prussiate of potash to use. Will you please tell me?

M. I. M.

ANS.—Yellow.

News of the Week.

MISCELLANEOUS.

Monday, April 14, 1879.

On Friday the 4th inst., subscriptions to the 4 per cent. loan amounted to $59,000,000, enough to redeem all the outstanding 5-20, 6 per cent. bonds. On Jan. 1st last, there were outstanding of the latter $350,000,000, and all these have now been replaced by bonds at 4 per cent. interest, making an annual saving of about $7,000,000 to the country in its interest account. The army appropriation bill has passed the House with that "rider" prohibiting the presence of U. S. troops at the polls. It will undoubtedly pass the Senate too. Then will the President veto it on account of its "rider?" And if so, will Congress refuse to grant money to pay the army, and in that way cause its collapse? These are exciting questions for politicians, but the country at large seems pretty confident that in any case, the nation is in little or no danger. As surmised here five or six weeks ago, Andrew D. White, president of Cornell University, has been nominated to succeed Bayard Taylor as our Minister at Berlin. His appointment has been confirmed by the Senate and gives general satisfaction. Clarence King has been appointed and confirmed as Director of the newly-created Geological Survey, whose object it is to thoroughly explore and map out all the geographical features of the country, especially of the Great West. That Advisory Board of officers appointed to investigate the grounds on which Gen. Fitz-John Porter was brought in as guilty of misbehavior in the field and consequently cashiered away back in 1862, has officially reported that his conduct during the Pope campaign was in every way praiseworthy and that he contributed largely to the salvation of the army. The evidence and "finding" reflect severely on Gen. Pope and still more so on Gen. McDowell.

One of the most remarkable social phenomena of the times is the exodus of negroes westward from some of the Southern States. Hitherto the movement has been chiefly confined to Louisiana and Mississippi, but it is rapidly spreading into other Southern States, and especially into those sections where bull-dozing is reported to have been practiced at elections. In the Pelican State whole parishes are denuded of their best laborers, planters are unable to obtain advances from their factors owing to the uncertainty of their being able to raise a crop through lack of laborers; real estate is rapidly depreciating from the same cause, and embarrassment and ruin are staring the helpless planters in the face. Fully 5,000 colored emigrants are reported already to have passed through St. Louis on their way to Kansas, and this is deemed merely the commencement of the movement.

In some parts of the South a species of mania appears to have seized upon the colored population impelling them to quit the land of their bondage and to seek elsewhere the Promised Land which they at present seem to think located somewhere in Kansas. Numerous causes have contributed to this hegira. There has been a glut of labor, in comparison with capital to utilize it, in some parts of the South for years, hence low wages; among planters there has been a great reluctance to break up large estates, so that the negro might get a chance to own a roof-tree and garden patch of his own; in many cases the rents charged to colored men have been ruinously high so that after a year's hard work and scanty rations, nothing is left to reward their toil and economy; retail dealers have been in the habit of charging exhorbitant prices for poor merchandise, their greed being limited only by ability of the negro customer to pay; all chance of social amelioration of their condition is nearly everywhere denied them; political troubles often endanger their lives, and the dread of them is a constant disturber of their peace. For all these reasons it is only natural that in their ignorance they should be willing to flee from the evils which they know of in search of the blessings which they hope for.

Then, again, there is ample reason for believing that the exodus has been strongly stimulated by disreputable tricksters who hope to make money out of it, and by unscrupulous politicians who desire to make political capital from it. The former are still promising those "forty acres and a mule" which have been the negro's hope since the late "unpleasantness," and the latter are urging him westward in order to lessen the population of the South by the time the census is taken next year, and so diminish the number of Congressmen from that section. Kansas is reported to be making exertions to afford ready employment to the swarms of negro immigrants. A National Emigrant Aid Society has been established in Washington, under the auspices of a number of "stalwart" Republicans, to encourage the emigration and aid the emigrants. Branch offices will probably soon be opened elsewhere, and a vigorous effort made to depopulate the strongholds of democracy in the South and "colonize" with stanch Republicans weak democratic sections in the West.

FOREIGN.

In England the reduction of wages is still being steadily enforced by employers in spite of the fierce opposition of workingmen. The former insist that to preserve the trade of the country they must manufacture goods cheaply enough to be able to compete in prices with those made elsewhere, especially by the cheap labor of Belgium, Germany and France, and by the machinery of this country. The men say cut down the profits of manufacturers and middlemen but leave the producers the bare livelihood they now get. Upwards of 30,000 coal hewers are now on strike, but the distress among them is so great that they must soon resume work on any terms. Agriculturists also are in a sorry plight, farms are going begging for tenants to work them and within the past year upwards of 1,000,000 acres have gone out of cultivation. Heavy snows still prevent active operations out in Afghanistan. Negotiations are still in progress with Yakoob Khan, but making slow headway. On the advent of milder weather some lively fighting is expected as it is not thought likely that the Khan, will submit without at least one defeat, and the half-savage mountaineers in rear of the British are reported to be ready to fall on them so soon as active operations are renewed. Down in Zululand about 5,000 Zulus fell upon a supply train of 105 English and killed nearly all of them. Col. Pearson is still surrounded by vast masses of Cetywayo's followers, and although a relieving force is being hurried forward as rapidly as possible, fears are entertained that it may arrive only after another massacre. *Per contra* Cetywayo's brother with 300 followers, has unconditionally surrendered to the British. The Zulu ruler years ago, killed the rest of his brothers, lest they should aspire to his sovereignty, and he is now probably sorry he didn't kill this one also, as the submission was probably prompted by a hope that the British may substitute him for his brother as ruler of the country after the latter has been crushed.

A vote of censure against Sir Bartle Frere, whose hasty action brought on the Zulu war, and against Lord Chelmsford, to whose military incapacity the British misfortunes are attributed, was introduced during the week in the House of Commons, but Disraeli's Cabinet contrived to have it defeated, though by a smaller majority than they usually command. The Khedive has finally dismissed the English-French-Egyptian Cabinet which has, for some time back, been endeavoring to extricate the country from the financial difficulties brought upon it by its ruler's extravagance. A ministry composed entirely of Egyptians has been appointed in its place. The English and French governments to whose subjects the country is mortgaged, protest vigorously against the change as likely to lead soon to national bankruptcy. Under their influence the Sultan, the Khedive's suzerain, is disposed to remove him and appoint his brother to rule in his stead. Some years ago, however, the Khedive paid a large sum to the Porte for a firman, guaranteeing to his descendants the government of the country, and at present it would seem like a breach of good faith to recall this firman without refunding the price paid for it. But, after all, no dishonesty or lack of good faith seems to deserve surprise or indignation in Oriental affairs. It is also supposed that Russia and Germany, chiefly through the instrumentality of Italy, are strengthening the Khedive's backbone in his opposition to the demands of his English and French creditors.

HERMAN.

Balmy sleep, good digestion, rich blood, elastic step and cheerfulness in Hop Bitters.

The Perfume of a Hemisphere. — Throughout an area occupied by more than one hundred millions of civilized beings, Murray and Lanman's FLORIDA WATER is to-day the standard perfume in society.

Sore Throat, Cough, Cold, and Similar troubles, if suffered to progress, result in serious pulmonary affections, oftentimes incurable. "*Brown's Bronchial Troches*" reach directly the seat of the disease, and give almost instant relief. **25c. a Box.**

Breeders of Fine Dairy Stock

Should at once investigate the PERFECT CREAMER advertised in another column. It will enable them to realize the largest possible yield per cow, and thus enhance the value of their stock as well as increase *the value* of the product.

Makers of Gilt-Edge Butter

Or those that desire to become such should use THE PERFECT CREAMER, advertised in another column. Butter made by its use, is always rated Gilt Edge, and commands ready sale and an extra price.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, April 12th, 1879.

BEANS AND PEAS.—The market for beans rests about where we left it. Mediums depend upon a limited trade for local use. Marrows are going out fast enough to make some firmness. Red kidneys are concentrated and holders make the price. White kidneys will have to drop closer to marrows to sell. Pea beans dull. Green peas steady at $1 70; So. B. E. peas, $2 50@2 55 per 2 bush. bag; Canadian in bulk and bond higher, 75@77c. Medium beans, choice, $1 30@1 35; fair to good, $1 15@1 25. Marrow, prime, free on vessels, $1 40; fair to good, $1 20@1 35; pea, $1 20@1 35; white kidney, $1 25@1 35; red, $2 50@2 70; black, $2 15@2 25. California Lima, $4@4 25.

Receipts for week, beans, 7,872 bush.; exports, 3,000 bbls.; do. peas, 6,675 bush.

BEESWAX—Has but little inquiry with 24@25c. quoted for Western and Southern.

BROOM CORN.—Offerings are not excessive and prices held steady.

Brush and short broom, choice, ₰ lb., 5½@6½c.; do. common to good, 4½@5½c.; hurl, good to choice, 3½@4½c; do., common to fair, 3@3½c.; red and crooked, 2@3c.

BUTTER.—Fresh stock is now the feature of real demand. Old has fallen into that uncertain position where "what will you give?" is the first question at the opening or closing examination of a lot. A few special savings for coastwise use, and a small line of home consumptive trade that insists on low-priced yellow at all seasons, brings more than our extreme. The bulk of both State and Western old must go out low. New butter fails to give general satisfaction. There is a marked difference in the quality compared with this spring and the early grass of '78. Most of the State seems purely hay-bodied. A few Delaware Co. and other marks show careful dairying and perhaps some grain feeding; these sell upon arrival. With weak stock it is the old spring story: the first indication of staleness starts it on a downward grade of prices.

OLD BUTTER ranges at 7@14c. for State, whole tubs, half tubs and firkins: creamery, 10@17c.; best Western dairy, 15@16c; other Western, 5@13c.; prime firkins, 7½@8½c.; grease, 4@4½c.

NEW BUTTER.—State pails and half tubs, choice, 17@18c.; good to prime, 15@16c.; fair to good, 13@14c.; Welsh tubs, choice, 16c.; good to prime, 14@15c.; fair to good, 13@14c.; poor to fair, 8@12c.; State creamery, best invoices, 22@24c.; good to prime, 20@21c.; fair to good, 18@20c.; Western, best invoices, 25@26c.; good to prime, 23@24c.; fair to good, 20@23c.; poor to fair, 18@20c.; imitation creamery, 14@20c.

CHEESE.—The export demand is slack, and the market is still unsettled.

Nominal for fancy; 8@8¼c. for fine lots; 6½@7½c. for good; 5½@6c. for fair; 2@3½c. for skimmed; 4@6c. for half skimmed. Wisconsin factory, fine and fancy, at 8@8½c.; do. good to prime, at 6½@7¼c. Western factory, fine 7@7½c.; good and prime, 5½@6½c.; do. full skimmed, 2@4c.; do. half skimmed, at 3@5c.

Liverpool cable, 41s., which is a decline.

Liverpool, steam 27s. 6d.

Receipts for week, 11,573 boxes.

COTTON—Has tended higher again thoough the week. On the fear that the ex ent of the new crop will be affected by the dissatisfaction among the laborers South. Closing prices are for April, 11.39@11.40c.; May, 11.49@11.50c.; June, 11.64@11.65c.; July 11.78@11.79c.; August, 11.90@11.91c.; September, 11.66@11.67c; October, 11.27@11.28c.; November, 10.93@10.94c.; December, 10.90@10.91c.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted:

DRIED FRUITS.—Apples are easy in price, and have a moderate trade demand. Peaches are held firm, but trade quiet. Small fruits are inactive.

Alden's evaporated apples are at 11½c.; Williams's at 11c.; new process apples at 8½@9c. State plums, 13½@14c.; Blackberries quoted at 4½c. Peaches—Peeled Georgia, 7@7½c. for poor; 8½@9c. for fair to good; 10c. for prime; choice North Carolina, 12@13c.; good do., 9@10c.; unpeeled halves, 3@3½c. quarters, 2½@3c. Pitted cherries, 20c. Apples—New, 2½@2½c. for southern quarters in bags; 3½@4½c. for prime sliced; do., fair at 3@3½c. State at 4@4½c. for new sliced; and 3½@4½c. for quarters; Western at 3½@4c. for new quarters. Raspberries, 27@28.

Exports for week, 1,607 bbls., apples.

EGGS.—Receipts for week, 19,937 bbls. Supplies have been materially below last Lent's open season. Sales have been liberal for Easter; but a lull must be expected after the Fast is over. The market has been kept lively by popular rates; annexed quotations have been current most of the week.

Near points, 14c.; State and Penn., 13@13½c.; Western, 13c.; Southern, 12@12½c.; poor lots, 11½@12c.; duck, 23@25c.; goose, 50c.

FEED.—Sales at 40 to 60 lbs. at $14.50@15.50; 80 lbs. at $14.50@15.50; 100 lbs. at $16@16.50.

FLOUR.—There has been more of a pressure to sell, and prices have ruled easy at a decline.

Latest prices are: $3 25@3.60 for interior to choice superfine State (fancy lots a shade higher); $3.65@3.90 for very poor to good extra do., odd lots and lines; $3.90@4.25 for good to very choice do.; $3.25@3.60 for inferior to very choice superfine Indiana, Iowa, Michigan, &c.; $3.60@3.90 for very inferior to good shipping extra do., and $3.90@4.25 for good to very choice extra do.; common to about choice white wheat extras, $4.25@5.35; choice to fancy do. at $5.35@6.25; red and amber winter wheat, very inferior to very choice trade and family, at $4.00@5.75 (fancy at higher figures); round hoop Ohio at $3.85@4.25, and trade and family brands of do. at $4.35@5.75, the latter rate for very choice (a few fancy lots held higher); St. Louis, $4.10@5.00 for very inferior to good extra; $5.00@6.00 for good to very choice (with a few very fancy brands up to $6.50@6.75; Minnesota clear, very inferior to very fancy, at $3.60@5.00, few brands going above $4.00; Minnesota clear, very inferior to very fancy, at $3.60@5.00, few brands going above $4.00; Minnesota "straight," very poor to fancy at $4.50@6.00; and patent poor to strictly fancy at $5.20@8.00, few brands going above $7.50; unsound stock at from $2.25@5.00; city mill extra at $4.85@5.20 for West Indies (the latter rate for fancy in new packages); do. for England $3.75@3.90; do. trade and family extras, $5.25@6.25; do. for South America, $5.15@5.65 for fair to very choice; No. 2 at $2.35@3.15 for poor to very choice.

FRESH FRUITS.—Apples have advanced, but the highest rates are only named for specials. The season is too close to detrimental weather to warrant holding or better figures. Exports for week, 4,300 bbls. New rates as follows: Spitzenburgs, $3@3.25 bbl.; Greenings, State, $2.50@3; do. Eastern, $2@2.50; Baldwins, $1.50@2.50; Russets, $2@2.25; common apples, $1.50. Cranberries are nominal at $7@8.50 for bbls. and $2.25@3 for crates. Strawberries are in market supply and prices are down to moving rates. Charleston and Florida, 25@35c. ₰ quart; hot-house, do. $1@1.25. Fla. oranges no longer of importance. Peanuts were pushed up in price anticipating the usual active spring trade. The weather, however, has been unfavorable, and with large receipts to come, sellers will be apt to shade prices. Va. hand-picked, $1.20@1.25; other, 90c.@1.05; shelled, 4½@5c. Pecans, 6@8c.

GRAIN.—All articles have been freely offered on tame English advices, and prices easier. Latest sales of wheat are of No. 2 Milwaukee spring at $1.04; No. 3 spring at 93@93½c; No. 4 spring at 86@88c.; rejected spring at 76@77c; ungraded spring at 81@86c.; ungraded amber at $1.10@1.11½; No. 2 amber at $1.10½@1.11½; ungraded red at $1@1.14½, higher price for fancy; No. 1 red at $1.14½; No. 3 red at $1.08½@1.09; No. 2 red at $1.13½@1.14; white State at $1.14; No. 1 white at $1.11½@1.12; No. 2 white at $1.09¼, ungraded white at $1.10@1.11½; New York No. 2 spring, May delivery, at $1.02½; No. 2 amber, April option, at $1.10½@1.11; do., May option, at $1.11@1.11½, do., June option, at $1.11½; No. 2 red, April option, at $1.15; do., May option, at $1.14; do., June option, at $1.14@1.14½; No. 1 white, April option, at $1.11½; do. May option, at $1.11½; do., June, at $1.12½; do., July at $1.12½. Rye at 58@60c. for Western, and 59@62c for State. Corn at for New York No. 2 at 45@45½c. New York steamer mixed at 44½@44½c.; No. 3 at 44c.; ungraded Western mixed at 43½@45c.; New York No. 2 white quoted at 48c.; round yellow at 47½c.; Jersey and Southern yellow at 45½@46c.; New York steamer yellow at 41½c.; white Western at 47½@48c.; New York No. 2, April option, at 45c.; do., May option, at 45½c.; do., June option, at 45½c., steamer mixed, April option, at 44½c.; do., May option, at 44c. Oats at for New York No. 1 quoted at 32½@32½c.; New York No. 2 white at 31½@31½c.; New York No. 2 at 31½@31½c.; do., May option, at 32c.; New York No. 3 at 31c.; New York No. 1 white at 33c.; New York No. 3 white at 31½c.; white Western at 33½@36½c.; mixed Western at 31½32½c.; white State at 36@40c.; No. 2 Chicago, afloat, quoted at 22c.; do., in store, at 30½c. Barley—No settled quotations at the close; feeding barley, 40c.

HAY AND STRAW.—Supplies are liberal and prices are easy on other than prime grades.

Sales at 40@45c. for shipping, and 70@75c. for retail qualities. Straw at 40@45c. for long rye, and 30@35c. for short rye, and oats at 35@45c.

Exports for week, 1,750 bales. The best hay now coming forward is Jefferson Co. This is used in first-class stables and is the only grade that brings our top retail price. River counties are losing their old-time prominence for choice supply hay; not that it is not raised, but the increased use along the river owns gives it a nearer market than New York.

HOPS.—Emmet Wells in his circular says: "A very fair trade has been doing, considering the advanced stage of the season. The shipments to Europe this week exceed the receipts by a little over a hundred bales. The scarcity or choice State hops has led to more inquiry for Pacific coast hops, but the prices asked for them are still above the views of holders, and but few transactions have taken place. It may now be safely said that the market has touched bottom on low grades; that is to say, merchantable hops will not be likely to go below five cents. Should the root and vine show signs of weakness in June, prices may materially advance. Vegetation is nothing like as far advanced now as at this time last year, probably owing to the wet, soggy condition of the ground, caused by the heavy body of snow; its effect upon the hop root will be known a little later on."

Quotations are for New York's, new crop, choice, 9@13; New York's, new crop, medium, 7@8; New York's, new crop, low to fair, 6@6; Eastern, 6@9; Western, 6@9; Yearlings, 2@4; Olds, all growths, 1@2; Pacific coast, 10@14.

MAPLE SUGAR.—The demand continues fair: retailers have this season adopted the common sense system of putting their price closer to wholesale figures. There is no good reason for a pound of this valuable product being carried over, if distributors will handle it without giving it the phase of luxury it once held. The same remarks will apply to honey and several other productions that have a crop magnitudes these later years. Vermont small cakes, 12@13c; State and Ohio, light, 11@12c.; dark, 9@10c.; old, 6@8c. Syrup in tin cans, 75c.@$1 ₰ gallon.

OIL CAKE.—Western is quoted at $27.

POULTRY AND GAME.—In live, prices have been well sustained, with a good demand and moderate supply. Spring chicks, 62@$1 ₰ pair; N. J. fowls, 15c.; Western, 13@14c.; Southern, 13@13c.; roosters, 7@8c. Turkeys, N. J., 16@17c.; Western, 15@15c. Ducks, choice, 90c @$1; other, 65@75c.; choice geese, $1.75@2; southern and Western, 75c.@$1.37. Pigeons, 35@40c.

The demand for dressed will be apt to increase after to-day, and with little offering prices are higher. Frozen are scarcer, which help the market.

Frozen turkeys, choice, 22c.; fair to good, 19@20c.; frozen chickens, 12@13. Dry-picked winter chickens, 25@30c. Spring, 35@38c.

Turkeys, best, 19@21c; the latter for Pa. dry-picked; other, 15@18c.; chickens, best, 20@22c.; other, 14@16c; fowls, choice, 15@16c.; other, 11@13c.; capons, 28@30c.; slips, 23@25c.; ducks, best, 20@22c.; other, 17@19c.

There is no extra demand, but prices are steady as supplies are moderate. English snipe, $1 25@1.37 ₰ doz; plover, $1.25@1.37; small snipe, 45@50c. W. pigeons, $1.50@.62; canvas backs, $1@$1.25; red head, 50@70c.; mallard 50@60c.; black, 50@55c.; common, 15@25c. Season must over for wild ducks.

PROVISIONS.—Have been in more active export demand, but at the close have tended lower on full offerings by speculators. Mess pork quoted at $10.40 for new for April; May at $10.40@10.45; June at $10.50, and July at $10.60. Bacon at $5.15@5..0 for long clear and 3½c. for short clear. Lard at $6.45 for spot; $6.42½ for April; $6.42½ for May; $6.50 for June, and $6.60 for July. Stearine at 6½c. for Western. Tallow at 6@6c for prime. Beef—Extra India mess, $19@23, as to quality; packet, $11@11.50; plain mess, $9.75@10.50; extra mess at $10.50@11.50.

SEEDS.—Clover is quiet at 5@6½c. for prime and choice Western.

TOBACCO.—There is a somewhat stronger feeling as to prices, but no absolute change.

VEGETABLES.—Exports potatoes, past week, 1,550 bbls. There has been a general advance in potatoes. Few remnants expected to remain in market by the time the South begins to deliver new. Onions are easier; Bermuda stock now takes some of the local trade. Southern produce holds pretty stiff prices.

Bermuda onions, $2 50@2 75 bushel; do., beets, $1.50@1.75 crate. Charleston asparagus, $9 doz.; Florida green peas, crate, $1@2; Sav. and Chas. 12 50@3; Virginia kale, $1 50@1 75 bbl.; do. spinach, $3@3 50 Baltimore, do., $2@2 25. Virginia radishes, $1@1 50 ₰ 100 bunches. Hot-house rhubarb, ₰ 100, $1@3; radishes, $3@4; cucumbers, $2@2.50 ₰ doz.; mushrooms, ₰ lb., 50c.; lettuce, selected, 25@75c. ₰ dozen. Bermuda potatoes, choice, $10@11 per bbl.; Early Rose and Eastern, $3 37@3 62; State, choice, at $2 75@3 25; fair to good, $2 50@3; Peach Blow, white, in bulk, $3@3 50; red, $2.75@3.25; Prolific, $3; Peerless, State, $2 37@2 62; Jackson white, $2 50@2 75; Mercer, $2.25@2.37; (outside rate per double heads). Sweet potatoes, Md. & Del., $3 50@3 75. Bermuda tomatoes, $1@1 25 box. Onions, Eastern, white, ₰ bbl., $4@5; red and yellow, $4@4 50; Chester, $4@4 50. Squash, Hubbard, $3@3 50; marrow, $3. Cabbages per 100, $4@6; R. turnips, per bbl., $1@1.25; beets, 75c.@$1.00; carrots, $1@1.12. Horseradish per bbl., $3@7.

WOOL.—Trade has been sluggish through the week, but no concessions have been made in prices. The disposition among buyers is to await the appearance of the new clips.

Ohio, Pennsylvania and Virginia—XXX and picklock, 35@38c.; XX, 33@35c.; X, 32@34c.; No. 1, 34@36c.; No. 2, 30@32c; common, 28@30c.; combing, 36@36c.

New York, Michigan, Indiana and Wisconsin—XX, 30@32c.; X, 28@31c.; No. 1, 31@33c.; No. 2, 27@30c.; common, 26@28c.; combing and delaine, 33@37c.

Iowa, Vermont and Illinois—X and XX, 28@30c.; No. 1, 30@33c.; No. 2, 27@28c.; combing, 33@36c.

Missouri, Kentucky and Tennessee—Washed fleece, 30@33c.; unwashed fleece, 18@24c.; unwashed combing, 27@35c.

LIVE STOCK MARKETS

Saturday, April 12, 1879.

BEEVES.—Receipts for the week, 9,125 head; do., last week, 9,751 do. Friday was quite generally observed as a holiday, and the attendance at the yards was light and competition not vigorous. An early brisk demand is looked for as slaughterers' wants will now increase for a time. Bulls and rough oxen sold at 3½@4½c. The main trade in good to prime steers was at 9@10c, the extreme range, 8½@10½c. to dress 55@57 lbs.; 4,580 quarters of beef go out by to-day's steamers. A small drove of live sold for London.

COWS AND CALVES.—The reduced range, $30@50 per head for common to good milch cows with calves by their sides, does not perceptibly increase the demand.

VEAL CALVES.—State live continue to run poor. Prime calves a grade firmer than through the week. N. J. and Bucks Co., 6c.; good do. and best State, 5½c.; other grades, 3@4½c. Dressed calves not largely wanted, as the weather may soon turn souring; best, 7@7½c.; fair to prime, 5@6½c.; common, 3@4½c.

SHEEP AND LAMBS.—Receipts for the week, 16,107 head; do. last week, 18,572 do. The first clipped sheep of the season brought 4½c.; common to prime, unshorn, 5½@6½c.; yearling lambs, 6½@6½c.; fine spring lambs, $4.75@5.50 per head; poor and small, $2.50@3 50 do.; supplies not oppressive.

HOGS.—Receipts for week, 24,568 head; do. last week, 31,678 do. No live on sale. Nominal and full rate, 4@4½c. Country dressed pork, light, 6@6½c.; medium, 5½@6c.; heavy, 5½@5½c.; city, 5½@5½c. Pork tenderloins, 8@9c.; no more wanted.

HORSFORD'S
Bread
Preparation
UNSURPASSED FOR MAKING
LIGHT BREAD,
Biscuit, Rolls, Cake and Pastry.

It is Better and Healthier than ordinary Baking Powder, Cream Tartar or Yeast.

The cost of raising Bread, Biscuit, &c., with it is only about half as much as by ordinary Baking Powder, and the result is much better.

It restores the nutritious elements which are taken from the flour in bolting. No ordinary Baking Powder or anything else used for raising bread does this.

Universally used and recommended by prominent Physicians.

If you cannot get it of your Grocer send a three-cent stamp to the manufacturers for a sample.

Manufactured according to the directions of Prof E. N. Horsford, by the Rumford Chemical Works Providence R. I

THE CHEAPEST and BEST FERTILIZER in the World, because it is pure bone (nothing else) ground in its natural state, retaining those elements that will surely restore exhausted land. Just the article for Wheat, Grain and Grass farms, Gardens, Conservatories, Hothouses, and Household Plants. Once using fully demonstrates its value. Sold in any quantity Circulars free. Address
Excelsior Fertilizing Co.,
SALEM, OHIO.

Reading for the Young.

THE HORTICULTURAL CLUB.

AMONG the letters from boys and girls published this week, is one that gives a short account of how a little gardener raised 85 bushels of onions on half an acre of land. This shows indisputably what boys, and even small boys, can do when they have the opportunity and go to work with a will. I hope that many of the members of our club will take the hint and "go and do likewise." It will not only be pleasant work, but a snug little sum of money may be realized. It need not necessarily be onions; it may be cabbage, celery, tomatoes, or anything that will sell. Of small fruits, Strawberries are, perhaps, the best paying and most easily cultivated. Now is the time to plant them. Give the land a good coat of manure. Secure young plants and plant them in rows twenty inches or two feet apart and eighteen inches between the plants. Monarch of the West, Charles Downing, Triomphe de Gand and Wilson are good varieties. Pinch off the flowers that may appear this year, except a very few just to show you the fruit, the plants will be so much stronger for it next year.

But I want to speak this time more particularly about

FLOWERS.

And of these I will first take up annuals, and those treated as annuals, or that class of plants that grow from seed, blossom, bear fruit, and die in one year. There are a large number of varieties, but, of course, in a small garden you can only grow a few of the choicest. The seed of all of them may be sown in the open ground, but for most of the varieties it is better to sow it in boxes three or four inches deep, filled with a mixture of leaf-mold, sand and soil from decayed grass sod. Shake the soil down rather firmly, moisten it with a sprinkler, sow the seed and cover it lightly with sandy soil scattered on with the hand. But the very finest seed, such as Lobelia, should not be covered; simply pat it down with a small piece of board. Keep the boxes in a warm, though not sunny place, till the seeds germinate; but after germination the plants should have all the light they can get. When large enough they are transplanted to the garden. Asters, Stocks, Cockscomb, Phlox, Verbena, Petunia, Gomphrena, Zinnia, and the pretty little blue-eyed Lobelia, are best treated in this way. Mignonette may be sown in the open ground.

Of the perennial flowers, or those that last several years, always select such as are perfectly hardy, which you can find out from a Catalogue when you select your seed. Most of them can be raised from seed like the annuals, but in that case only a few will bloom the first year; others are propagated by dividing the roots. Hollyhock, Lily of the Valley, Paonia, Aquilegia, Hesperis and Campanula are examples of this kind of plants.

I wish to say also that you must be careful to label everything, so you can always know the names of your plants. Learn the Latin names. These are the names that all plants are known by the world over, in all languages; the common names are only local, and therefore, not of so much importance.

The Club is growing very popular. Names of new members are constantly coming in, and I hope that ere long *all* the cousins will join. As I have stated before, I will answer all reasonable questions in regard to the treatment of your plants. I will also say that I am propagating a number of rare plants, which I will send free of all charge to those members who send me the best notes of what they are doing in their gardens, and who take the most active, stirring interest in the club. This will be a standing offer.

Numerous essays have been sent by the competitors for

THE PRIZES

I offered; but I am sorry to say that there are but few good ones, and none really excellent. There are many points to be taken into consideration in writing an essay, but as instruction in this line does not fall within my sphere, I will leave that to your respective teachers. 1st prize was taken by E. P. Powell, of Clinton, N. Y., who wrote on Blooming Trees and Cuttings. 2d prize was awarded to Miss Lizzie Hay, of Seneca, Kansas, who wrote on Flowers and Fruits. Miss Mabel C. Hoskins of Newport, Vt., took 3d prize. She entitled her essay, "What I have Learned about Flowers in One Year;" and 4th prize was gained by Miss Minnie S. White, of Alden, N. Y., who wrote a short but neat essay on Strawberries. The seed will be forwarded immediately, together with the congratulations of UNCLE MARK.

CHAT AMONG THE FLOWERS.

MRS. E. J. RICHMOND.

"HEIGHO, Miss Crocus. What are you about there, stirring so uneasily in your bed?" cried Miss Tulip, in a voice smothered by the mold which covered her still.

"Here you have been snuggled so cosy and comfortable all the long cold winter. Why can't you be quiet now?"

"The sun has kissed me, and I am glad to awake," said Crocus in a clear voice, for she had peeped above the leaf mold and had seen the brown earth once more."

"Oh Tulip, if you could but see the dear Pansies looking so green and comfortable, and the pretty Hyacinths just showing their little heads, you would stop grumbling and try to wake up too. Even Madame Paony over there by the walk, is crowding her red hood through the brown withered grass, to see how the young plants are getting on."

"Time enough by-and-by," muttered Miss Tulip. "The Winter King wrapped the Pansy tribe so close and warm in his great drifts. A poor return for all his kindness, I think. I do not admire pushing-forward people. Modesty is becoming even among the flower people."

"Ha, ha! what is that you are saying down there?" said gay little Daffodil, tossing her long, green leaves. "Grumblers are always vulgar, disagreeable creatures, I think. Wake up here and enjoy yourself like the rest of us."

"Oh, my dears, do not quarrel so," said Miss Pink, who, like the Pansy family had been so closely wrapped by the friendly drifts that she had not lost her summer dress. "We gain nothing I am sure by finding fault with each other. And Miss Tulip, it does seem nice to peep out from that dismal snow-shroud, and see all the dear friends again. "We are waiting patiently for you my dears."

"Well, well, all in good time, little pet," ejaculated Miss Tulip. "I'll be up and dressed in my gayest robes before you now, see if I don't." And true enough, when the flowers one after another came timidly forth, there stood Miss Tulip all in gold and scarlet robes like a queen waiting to receive them.

DREAM OF FAIR WOMEN.

Continued from last week.

AND Aunt Lou read aloud from the book in her hand:

"The daughter of the warrior Gileadite.
A maiden pure; as when she went along
From Mizpeh's towered gate with welcome light,
With timbrel and with song.

"Grandma must help us here, if she will. Please turn to the eleventh chapter of Judges from the thirtieth to the thirty-fifth verses."

Grandma kindly complied, and read in her sweet, tremulous tones, the simple, touching story:

"And Jephthah vowed a vow unto the Lord, and said, If thou shalt without fail deliver the children of Ammon into my hands,

"Then it shall be that whatsoever cometh forth of the doors of my house to meet me when I return in peace from the children of Ammon, shall surely be the Lord's, and I will offer it up for a burnt-offering.

"And Jephthah came to Mizpeh, and behold his daughter came out to meet him, with timbrels and with dances; *and she was his only child; beside her he had neither son nor daughter.*"

"And did he kill her?" cried Bess, with wide-open, horror-struck eyes.

"Modern commentators," and Aunt Lou looked a little apprehensively at grandma, who was understood to be the principal Bible critic of the family, "think that he simply dedicated her to the service of the tabernacle, and consequently to perpetual maidenhood. There were a class of women set apart from others, whose whole time was employed in weaving and embroidering the draperies of the tabernacle and the beautiful sacerdotal garments for the priests, and it is thought that this was the life to which her father devoted her. It must have been a terrible trial to him, an ambitious and warlike man, to thus give up all hope of perpetuating his name and family in Israel."

"But the poem represents her as dying 'for God and for her sire,'" objected Madge, who had all a school-girl's love for the tragic.

Aunt Lou smiled.

"A poet and a commentator are two very different persons, my dear; and the poetic idea is best embodied in this translation of the story. But we must leave the heroic Hebrew maiden to make the acquaintance of an altogether different character:

'I am that Rosamond, whom men call fair,
If what I was I be.'"

"Oh, I know all about *her*, too!" exclaimed Madge, with no little pride. "She was the Lady Rosamond Clifford, and she was so beautiful that King Henry II. saw and loved her. And he built a splendid palace at Woodstock for her, with a labyrinth of walks and avenues all about it, so that no one could get in or out that hadn't the clue. And one day his queen, Eleanor, who was always mistrusting something about everybody, noticed a thread of floss silk, such as ladies used in their embroideries, sticking to one of his spurs. She didn't say a word, but she just followed that silk in and out, in and out, and at last it led her to the palace at Woodstock, where she found a lovely lady in one of the turret chambers, busy with her embroidery. Just as quick as she put her eyes on her, the jealous old queen knew in a minute that this was the Fair Rosamond that she had heard of; and she was so mad that she held a cup of poison to her lips and made her drink it, and it killed her right there on the spot."

"Good for you, Madge! I didn't mistrust you knew so much," declared Will, admiringly. "But honestly, Aunt Lou, how much of that is fiction and how much fact?"

Madge looked rather indignant, but Aunt Lou soothed her wounded vanity by saying in a careless tone,—

"*Most* of it is fact, I suppose. Only the story of her death at the hands of her indignant rival cannot be true, as the fair but frail lady retired of her own accord to the nunnery of Godstow, where she lived for many years, a sincere and humble penitent; and was buried in the chapel of the convent, where her tomb was to be seen as late as the time of Cromwell, when some Puritan fanatics broke into the chapel, destroyed the monument, and scattered the bones of the poor lady in every direction."

The young people were silent for a moment; the sad story of poor Rosamond had, for the moment, saddened and touched their hearts. But Madge at length broke the silence with, "Of the three others, I can tell only one, Joan of Arc. Who was it that

'Clasped in her last trance
Her murdered father's head'?

and who the one, that

'Kneeling, with one arm about her king,
Drew forth the poison with her balmy breath,
Sweet as new buds in spring'?"

"The first is supposed to refer to Margaret More, the daughter of Sir Thomas More, a man of great wisdom and sanctity, who was beheaded by the tyrannical Henry the VIII., because he would not give his approval to the king's divorce from Katherine of Arragon. This devoted daughter is said to have gone at night, with only one faithful attendant, and taken her father's head from a turret of London Bridge, where the brutal king had ordered it placed, and carried it home in her own arms, where it was reverently deposited in the family vault.

"The other was Eleanor, queen of Edward I. The king having been wounded by the poisoned dagger of an assassin, his wife sucked the poison from the wound at the risk of her own life."

"Ugh!" and Bess's dainty nose took an upward curl, but Madge whispered, with a tender mistiness in her thoughtful eyes: "Thank you, auntie; but I think Tennyson ought to have put his last first, and made that sweet, brave Margaret More, and Edward's faithful, loving queen the *most* instead of the *least* prominent among his 'fair women.'"

"So do I."

And to this, grandma and even Will nodded a decided approval.—*The Watchman.*

LETTERS FROM BOYS AND GIRLS.

DEAR UNCLE MARK:—I like your project real well of forming a Horticultural Club composed of the boys and girls who read the RURAL NEW-YORKER. My father has plowed a large piece of land in our front yard, and this spring, mother is going to set out in it some pretty shrubs and choice trees, and my little sister and myself are going to have a real nice, little garden of our own there, in which we shall have a few vegetables and some Raspberries and Strawberries, and where we shall try hard to raise some beautiful flowers. Pa got five packages of choice shrub seeds from the Seed Distribution of the RURAL NEW-YORKER, and we shall plant them in our little garden, too, and hope we may be able next fall to tell you how finely they grew. Please put Nellie Hay's name on the list for your "Horticultural Club," as also the name of your young friend, LIZZIE HAY.

Nemaha Co., Kan.

DEAR UNCLE MARK:—I will tell all the little boys how my brothers and I raised a half acre of onions last year. My father hired a man to plow the ground in ridges about three inches high and 18 wide, so that a small cultivator could go between the rows. We leveled the tops of the rows off with a rake and planted the seed with a hand-seeder. In a short time we could see the little needle-shaped plants coming up double through the ground, and then we began to weed them, and we had hard work to keep ahead of the weeds. But the plants soon got big enough to cultivate with our old white mule that father lets us use to cultivate the garden, because "she's safe," he says. And I think every boy who has a market garden should have just such a mule. Ours is 23 years old. Well, we cultivated and hoed our onions three times and they grew finely and were nice large onions; and when we came to pull them we made a "bee" and invited my little sister and two cousins, so there were six of us. We made jolly times, and short work, too. Next we gathered them up and sorted them for market. We had 85 bushels. My father was not well, so my brother, who is 13 years old, had to take the onions to market ten miles off. He sold $70 worth besides saving plenty for home use. And now when we have them cooked, I believe they taste sweeter to us for having raised them all ourselves. BERTIE PARK.

Waukesha Co., Wis.

P.S.—I am 10 years of age and I wish to join your Horticultural Club. B. P.

The Puzzler.

HIDDEN STRAITS.

1. Mamma, Totch-kine are a new breed.
2. Yes, Mac, as Sarah has promised.
3. It is dismal Acca I assure you.
4. As it is damp, I earnestly coax you to stay.
5. Hear the pigeon coo, Katie?
6. If oyeaux are not birds, what then?
7. Ida, visions come to many.
8. Try the river bank Samuel.
9. What a thud Sonia made in falling.
10. Wilhemena is dead.
11. If "rob" is her design I'll frustrate it.
12. Don't blab Able, man, Debby loves you.
13. Mamma, Galilean spoke to me to-day.

☞ Answer in two weeks MAY.

A MALTESE CROSS PUZZLE.

Top—A species of cheese; a toilet article; an insect's egg; a consonant. Right—A highway robber; a small fruit; a vegetable product; a consonant. Bottom—A fish; convenient; wicked; a consonant. Left—A sort of flour; to rob; part of a drama; a consonant. Center, top—To sleep lightly (beheaded). Center, right—A European river. Center, bottom—Three consonants. Center, left—Ancient. Center—A vowel. Centrals both down and across form two countries in Europe. LITTLE ONE.

☞ Answer in two weeks.

PUZZLER ANSWERS.—April 5.

ANSWER TO DROP-LETTER PUZZLE, 2—Put the right letters in and I am complete.

Sabbath Reading.

A SUPPLICATION.

THE following is a most remarkable composition. It evidences an ingenuity of arrangement peculiarly its own. Explanation—The initial capitals spell, "My boast is in the Glorious Cross of Christ." The words in *italics*, when read from top to bottom and bottom to top, form the Lord's Prayer complete:

MAKE known the gospel truths, *our* Father king,
Yield us thy graces, dear *Father* from above,
Bless us with hearts *which* feelingly can sing,
"Our life thou *art* for *ever*, God of Love?"
Assuage our grief *in* love, *for* Christ we pray.
Since the bright Prince of *Heaven* and *glory* died,
Took all our sins and *hallowed the* display.
Infant *being*, first a man *and* then was crucified.
Stupendous God! *thy* grace and *power* make known,
In Jesus' *name* let all *the* world rejoice.
Now labor in *thy* heavenly *kingdom* own
That blessed *kingdom* for thy saints *the* choice.
How vile to *come* to thee *is* all our cry.
Enemies to *thy* self and all that's *thine*,
Graceless our *will*, we live *for* vanity.
Loathing the very *being*, *evil* in design,
O God, thy will be *done from* earth to heaven;
Reclining *on* the gospel let *us* live,
In *earth* from sin *delivered* and forgiven,
Oh! *as* thyself *but* teach us to forgive,
Useless *it's* power *temptation* doth destroy,
Sure *is* our fall *into* the depths of woe.
Carnal *in* mind, we've *not* a glimpse of joy
Raised against *heaven*; in *us* hope can flow.
O *give* us grace and *lead* us on the way.
Shine on *us* with thy love and give *us* peace,
Self and *this* sin that rise *against* us slay,
Oh! grant each *day* our *trespasses* may cease,
Forgive *our* evil deeds *that* oft we do,
Convince us *daily* of *them* to our shame.
Help us with heavenly *bread*, *forgive* us too,
Recurrent lusts, *and we'll* adore thy name,
In thy *forgive*ness we *as* saints can die.
Since for *us* and our *trespasses* so high,
Thy Son, *our* Saviour bled on Calvary.

THE LIFE TO COME.

IF we were able to look into the great world beyond, we might repine at being obliged to remain here so long. Just as God has placed great gulfs of space between the planets, so that the inhabitants of each shall only know the affairs of its own globe, he has also placed a gulf between this world and the future life. Thus, he makes it our duty to think, not of dying, but of living; not of the hereafter, but of the here; not of the world to come, but of the world that is. Every day we are to prepare, not for death, but for life; for if we live well and wisely here we may certainly trust God as to our hereafter. This, however, I think we may say, that death, when it comes, must be considered not a bad thing but a good thing. Since the Almighty sends death to every one of His creatures to whom He has given life, since death is as universal as life, death must be a blessing as well as life. Some great advantage must be connected with this event which we call death. It is made fearful when we look forward to it from a distance, that we may not too rashly seek it, before we have had enough of the discipline of this world.

When it comes it usually is welcome; and it may be that, when we look back upon it from the other world, we shall smile to think that we should ever have been afraid of it. This also we know of the other world: That it is created by the same being who has made this world; it is another mansion in the house of our Father. Consider, then, what He has done for us here, if you wish to know what He will do for us there. If there is infinite variety in this world—day and night, sleep and waking, changing seasons, flowers and trees, lakes and rivers, mountains and plains—a vast flora and fauna—then there will, no doubt, be an equal or a greater variety there; for surely the Creator has not exhausted Himself in making this world. There, as here, there will beauty for the eye and ear; problems for the intellect to investigate; work to do, full of utility; society, intercourse, affection; the power of progress; the sight of goodness and greatness above us to aspire to and reverence. There will be enough to ponder, enough to do, and enough to love.—*James Freeman Clarke.*

HOME RELIGION.

HOME religion is a thing of the heart—which is the same as saying it is a thing of love. It may exist in connection with forms; and it may exist in its sweetest unfolding, independent of forms. It may say grace at the table; and it may not say grace at the table. It may be gifted to sustain a family altar; and it may not have the gift requisite. But if the heart be right, there shall be grace and prayerfulness albeit forms be lacking in the family. There is a way of eating your food which thanks God better than any grace-saying that can be devised. There is a way of kissing the wife after the meal and the husband is leaving for office, which covers the whole ground between husband and wife intended to be covered by the influence of the family altar. We have known a man ask a blessing on food which he himself condemned in the very next breath. To thank God for food, and scold your wife or the cook in the next breath because the steak is overdone, or the cakes not browned to your suiting, or the tea too strong, is something more, my friend, than impiety; it is indecency.

Home religion should be loving first of all, and last of all it should be—loving. It should be very patient, too—especially on those days when it is hard to be patient. It should be cheerful, especially when it takes wit to invent occasions of mirthfulness. It should be brave, not to face the troubles that are without, but the troubles that are within. A kindly word, a pleasant speech, a cheerful or sympathetic look, a touch of the hand in the old tender fashion of the courting days, a stroking of the cheek and the soft movement of the palm over the hair—"Foolish tricks?" You are a fool if you say it, friend. You didn't think they were foolish tricks once, and you were wiser then than you are now that you have dropped them. A little more courting in married life would keep married life what courtship is. The foolishness of love is wiser than the wisdom of hate; and the more foolish you are in these directions, the happier will your homes be, and the sweeter will be your home religion.—*Northwestern Christian Advocate.*

PERSONAL ITEMS.

Edward Kinney, a negro, and Mary Hall, a white woman, were senteneed to five years in the State-prison this week, at Hanover Court-House, Va., for marrying.

Madame Patterson Bonaparte, who died at Baltimore Friday, left an estate valued at over a million and a half, saved by parsimony. It goes to her grandsons, Charles and Jerome Bonaparte.

Justin McCarthy, the novelist, was elected a member of the House of Commons for the county of Longford, Ireland, by the Home-rulers last week without opposition, in the place of Miles William O'Reilly, appointed Commissioner of Education.

The Pope is making great reductions in his personal household, observing that it is useless to keep up an enormous kitchen where nothing is cooked. His dinner consists of a soup and one plate. Of personal service he requires very little, so that his retainers will be reduced to one-third of their number.

Of the 362 Congressmen, 241, or two-thirds, are lawyers, 24 are merchants, 16 *farmers*, 12 bankers, 10 editors, 9 manufacturers, 7 doctors, 5 railroad men, 3 teachers, 2 preachers, and 18 are without occupation. There are 4 Union and 20 Confederate soldiers in the Senate and 50 Union and 65 Confederate in the House.

Mr. Browning's only son is not a poet, but a painter, and his first picture in the Royal Academy was sold for £300; the only son of M. Gonnod, the composer, is not a musician, but also a painter, and is about to marry the daughter of a painter; of Mr. Tennyson's two sons, one acts as amanuensis for his father and the other is in the Indian civil service. But Dickens's son is an editor, and is also about to appear as author of a "Dictionary of London."

When the now famous Zulu Cetywayo, who is now giving the Britishers so much trouble, was Prince Imperial he gave his father great trouble, for instead of looking after the royal cattle, his special duty, he passed nearly all his time at Greytown, the nearest English town. There he amused himself after his manner, drinking brandy, which he could not get at home, and smoking pipes, which his dignity prevented his doing among his own people. He paid court to the ladies, and had the reputation of going the pace, so far as to propose to a barmaid and vow vengence against a missionary who refused to marry them, because the sable prince put restrictions on the reverend dominie's dealings in cattle with the natives.

MACHINES FOR
Threshing and Cleaning Grain and Sawing Wood.

Patented, Manufactured and Sold by
A. W. GRAY'S SONS,
Middletown Springs, Vt.

The machines with the improvements are the result of more than thirty years' careful study and experiment.
The proprietors are the inventors, ever have been and still are the sole manufacturers.
We have labored from the first to produce machines that will be durable, tasty, compact, portable, and that will run with the least possible friction.
We believe that we manufacture the best machine of the kind in the country.
Our machines have never failed to receive the highest award at all competitive exhibitions.
Circulars and Price Lists free. Address as above.

The Anti-Friction Hay Carrier,
elevates perpendicularly, and conveys horizontally any desired distance. **Many Thousands in Use.** The cheapest, strongest, most convenient, and durable Carrier made.
THE NOYES GRAPPLE FORK handles fine, coarse, or loose hay; is cheaper than a harpoon, easy to handle, strong, durable, and guaranteed the best Horse Fork made.
Send for sheet containing 23 ENGRAVINGS AND DRAWINGS—designs for tracking and arranging barns, bill of lumber, and full details for making Field Stacking Frame, etc., etc.

COOLEY CREAMER

Supersedes large and small pans for setting milk.
It requires no milk room. It requires capacity for one milking only.
Impure air, dust or flies cannot reach milk set in it.
It makes more butter, because it raises all of the cream, and the quantity is never lessened by unfavorable weather.
It makes better butter. It requires less labor. It is cheaper.

Butter made by this process took the HIGHEST AWARD at the INTERNATIONAL DAIRY FAIR—and brings the highest price in all the great markets.

The Charter Oak Swivel Plow.

THE ONLY PERFECT SWIVEL PLOW.

WALPOLE, N. H., April 13, 1878.
HIGGANUM MF'G CORP.:—You wanted to know how I liked the Charter Oak Swivel Plow No. 130. I would say that I have used it on all kinds of land, and think it the best plow I ever saw or used. I have used seven or eight different kinds of swivel plows and this beats them all in doing good work, and draws much easier I would not exchange it for any plow I ever saw.
Yours in haste, O. J. HUBBARD.

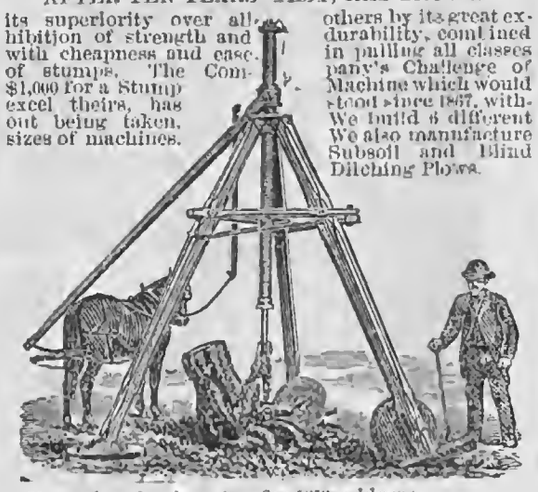
Manufactured only by
THE HIGGANUM MF'G CORPORATION,
Higganum, Ct.

Implements and Machinery.

THE CHAMBERLIN
SCREW STUMP MACHINE,

AFTER TEN YEARS' TEST, HAS PROVED

its superiority over all others by its great exhibition of strength and durability, combined with cheapness and ease of stumps. The Company's Challenge of $1,000 for a Stump Machine which would excel theirs, has stood since 1867, without being taken. We build 6 different sizes of machines. We also manufacture Subsoil and Blind Ditching Plows.



For reduced prices, &c., for 1879, address

THE "ILION" RAKE

The Best Self-Discharging Rake in the market. Its simplicity makes it very desirable, being less number of pieces, which all duplicate, can be put together quicker than any other rake before the public. Has a wide range of quick adjustment. No grass ratchets, etc., exposed to the wind. It is controlled by the will of the operator, leaving both hands free, and is so easily handled that a child can operate it. *Farmers, before purchasing, are invited to give this Rake a close inspection;* and if there is not one in your vicinity, write for full particulars to

Wit and Humor.

THE COMICAL CROW.

BY GEORGE COOPER.

"Caw! caw!" sang a crow on the edge of a wood;
"The corn that you gave us is wonderful good;
But why don't you lay it there all in a heap?
You scatter it round and you plant it so deep,
Good farmer it's tiresome to find it, you know,"
Said this comical crow.

"Caw! caw! You have stretched, in a zigzaggy way,
A string round your acres. I see it to-day.
'They'll think it a snare,' said you, chuckling outright,
Your cord is no use, sir, as I'm not a kite.
Sweet farmer, I'd have you continue to sow,"
Said this comical crow.

"Caw! caw! You have set little boys on the fence.
They shout and amuse us—our joy is intense.
You give yourself plenty of trouble for us.
We're only plain folks. Prithee, don't make a fuss!
Kind farmer, we're not used to much of a show,"
Said this comical crow.

"Caw! caw! You have put an old coat on some sticks
You want to delight us with all sorts of tricks.
Unmerited kindness we tenderly feel;
But why don't you leave till we finish our meal?
Dear farmer, you're not in a hurry to go,"
Said this comical crow.

"Caw! caw! You have brought out a neat little gun.
You're going to shoot at the sparrows, for fun.
Oh, fie! we shan't wait till you've loaded it up,
But hie us away to the next field and sup.
Bad farmer, sad farmer, your end will be woe,"
Said this comical crow. *Independent.*

An old bachelor says he's been so often deceived by the chicken of the restaurants and boarding-houses that he calls it "the mocking bird."

One reason why more people did not go into the ark is that Noah neglected to advertise in the daily papers. There is a great moral lesson in this fact.

The immorality of the age says one, is with some men a standing topic of complaint. But if any one likes to be moral I can see nothing in the age to prevent him.

Sympathizing stranger—"Bless me! How did you manage to fall like that, sir?" Irritated equestrian who has come to grief: "Confound it! I couldn't remain hanging in the air after the horse ran away from me, could I?"

A cat's eyes are said to be the largest at midnight. We never made an examination; but we are positive that its voice is about seventeen times larger at that hour than at any other period during the twenty-four.—*Boston Globe.*

Paper napkins to the number of 250,000 have been sold by one Boston firm since they were introduced a year ago. Take paper napkins at five cents a dozen, and stamped wooden plates at ten cents a dozen, and you have a reasonably inexpensive table outfit that does not require washing.

The following anecdote was told by an American preacher for a fact: He was praying, and in his prayer he said, "I pray that the power of the devil may be curtailed." Just then an old darkey in the congregation cried out, "Yes; amen! Bless me! Cut him tail right smack, smove off."

"How much shall you charge for a bologna sausage that will reach from one of my ears to the other?" asked a soldier of Berlin of a dealer. "Fifty kreutzers," was the reply. "I take the offer," replied the soldier. "One of my ears was cut off in a battle a thousand miles from here." There was a compromise.

Wretched and Racked.

By the pangs of rheumatism, the joints eventually become grievously distorted, and sometimes assume an almost grotesque deformity. To prevent such results by a simple and agreeable means is certainly a wisdom. A tendency to rheumatic ailments may be successfully combatted with Hostetter's Stomach Bitters, a medicine with the prestige of a long and successful career, of unbounded popularity, and of emphatic professional endorsement. It removes from the blood those inflammatory impurities which pathologists assign as the cause of rheumatism, and not only purifies the life current, but enriches it, promoting vigor by fertilizing its source. Digestion, the action of the bowels and the secretion of the bile, are aided by it, and it impels the kidneys and bladder to a regular and active performance of their functions. It is besides a thoroughly reliable remedy for, and means of preventing periodic fevers.

METALLIC SHINGLES.

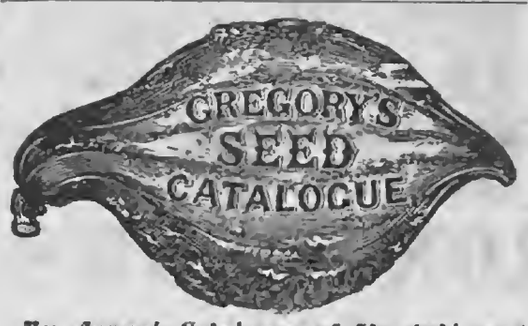
The Perfect Creamer is a great success. It excels all other systems in quantity and perfect quality of butter made from a given quantity of milk. The increase in value of produet will pay for it in one season. See adv. in another place.

The best method of setting milk is by use of the PERFECT CREAMER OF BUREAU MILK PANS. It maintains a uniform temperature at all seasons, excludes flies and dust, uses but a very small quantity of ice. Is the most economical in time, labor, and money of any system ever devised.

WILBOR'S COMPOUND OF
PURE COD LIVER OIL AND LIME.

To Consumptives.—Wilbor's Cod-Liver Oil and Lime has now been before the public twenty years, and has steadily grown in favor and appreciation. This could not be the case unless the preparation was of high intrinsic value. The combination of the Phosphate of Lime with pure Cod-Liver Oil, as prepared by Dr. Wilbor, has produced a new phase in the treatment of Consumption and all diseases of the Lungs. This article can be taken by the most delicate invalid without creating the disgusting nausea which is such an objection to the Cod-Liver Oil when taken without Lime. It is prescribed by the regular faculty. Sold by the proprietor, A. B. Wilbor, Chemist, Boston, and by all druggists.



My Annual Catalogue of Vegetable and Flower Seed for **1879**, rich in engravings, from original photographs, will be sent FREE, to all who apply. Customers of last season need not write for it. I offer one of the largest collections of vegetable seed ever sent out by any seed House in America, a large portion of which were grown on my six seed farms. *Printed directions for cultivation on each package. All seed warranted to be both fresh and true to name; so far, that should it prove otherwise, I will refill the order gratis.* The original introducer of the Hubbard Squash, Phinney's Melon, Marblehead Cabbages, Mexican Corn, and scores of other vegetables, I invite the patronage of all who are *anxious o have their seed direct from the grower: fresh, true, and of the very best strain.*

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME.

VOL. XXXVIII. No. 17.
WHOLE No. 1526.

NEW YORK CITY, APRIL 26, 1879.

PRICE FIVE CENTS.
$2.00 PER YEAR.

[Entered according to Act of Congress, in the year 1879, by the Rural Publishing Company, in the office of the Librarian of Congress at Washington.]

Horticultural.

VITIS INDIVISA.

Vitis heterophylla var., is the species described and figured in the Rural New-Yorker of Nov. 9. This scarcely deserves to be called *variegated* because the variegation is not constant. We have never seen an old plant that was variegated in every leaf, or one in which variegation did not appear in some part. The variegated blood, though diffusing itself, as it were, in channels, is yet very potent—for of 100 seedlings from it, as many as 75 will show variegation which cannot be said of the seedlings of any other variegated plant that we now recall. Vitis indivisa, or entire-leaved Grape, differs from the other in having, as its name implies, leaves that are rarely lobed, but which are rather coarsely toothed. The berries are much the same, having a wax-like appearance and being, according to their stage of ripening, light-blue, pink, white or green, speckled with tiny dots of brown, so that all of these colors may be shown in a single raceme. The V. heterophylla is an Asiatic species, but we cannot doubt that both have the same origin from the fact that both in seedlings and in old plants we have seen leaves which were both entire and toothed. Vitis indivisa, the subject of our present sketch—which is a free drawing from a colored plate in Meehan's "Native Flowers," grows wild on the river-banks of West Virginia, Ohio and southward. It is a fine ornamental vine and well worth cultivating for its waxy, variously-colored berries alone. Seedlings start in a few days or weeks if the seed be planted fresh from the berry. If not, they (the seeds) may be sown in the fall and, exposed to frosts, they will germinate in the spring.

NOTES FROM THE RURAL GROUNDS.

Eulalia Japonica Zebrina is one of the few novelties that has proven of great value. It is one of the hardiest and the most striking of grasses, and has here passed three winters in safety without any protection.

"Happy Thought."—This is the Pelargonium introduced about five years ago in this country with leaves having white discs and green margins—just reversing the markings of the old silver-margined varieties. We have raised quite a number of seedlings from it, but not one has ever shown a sign of variegation. We have never learnt whether this variety is a "sport" from an old variety, or whether it was produced directly from seed. It would be interesting to know.

"Fascination."—This new Coleus, offered this season for the first, is really beautiful, and seems to merit all that the descriptions in catalogues claim—which is phenomenal.

In Light Soil, plant the corms of Gladioli, if large, six inches deep. This will so support the flowering stalk that it will need no stake, unless growing in an exposed situation. A mulch of old barn-yard manure, applied about the first of July, will be found to increase the size and durability of the flowers. Scarifying the surface of choice bulbs will induce the formation of bulblets which will bloom the second year and bear flowers true to the parent name.

Cut Flowers.—For a bed of flowers to make bouquets from during the season, few plants are better than Verbenas and Pinks. Of the latter, Heddewigii, Diadem-flowered, Cut-leaved and the Chinese double are the best. They will bloom (if the seeds are sown now) during the summer, and by the aid of a little protection will again bloom freely another year. Verbenas may be bought for seventy-five cents per dozen, which, if pegged down, will soon fill a bed six feet in diameter. No other colors are more brilliant than those of choice Verbenas. Both the flower itself and its freshness of color endure well. Years ago, thousands were propagated and sold where one is now. But we can do no better than to apologize for our neglect and restore the plant to its old favor.

Petunias of all kinds are thrifty growers and abundant bloomers, but they are rather coarse for our choicest beds, and the flowers, though striped and blotched, are still rather dull in their limited range. They are excellent for rockeries or for hot situations where other plants would need far more care.

Pansies.—The secret of *large* Pansies, like that of large Strawberries, is rich soil, good drainage and moisture. Both are benefited if they escape the mid-day sun. There are many pretty bedding flowers from which to choose, but we should feel lost without Pansies—they are to the garden what the clown is to the circus.

Herbaceous Plants.—Fashion, like history, repeats itself, and glad are we that there is on every hand a disposition to return to hardy herbaceous flowers. One tires of ribbon beds. They are expensive and monotonous. They are showy—that is all—and it is showiness maintained at a wicked cost. Herbaceous plants give us an endless variety of form and color and they bloom from earliest spring till latest fall. When once planted, they are planted for years, and need no further care than the circle of earth about a tree. Those of our readers who are poor and lazy, and yet fond of a pretty garden, are advised to procure hardy herbaceous plants. The following are a few which we have selected as suitable for general cultivation:

Phalangium Liliago. Anemone Japonica and fulgens, all of the Aquilegias, Dicentra eximia and spectabilis (Bleeding Heart), Ipomæa leptophylla, Asclepias tuberosa, Geranium sanguineum, Aster Novæ-Angliæ, Delphinium azureum and formosum, Astilbe Japonica, Campanula rotundifolia, Centranthus ruber (Jupiter's Beard), Gentiana Andrewsii, Chelone obliqua (Turtle-head), Clematis recta, Gillenia trifoliata, Convallaria majalis (Lily of the Valley), Coreopsis lanceolata, Iris Kæmpferi, Cypredium spectabile (for boggy places), Funkia ovata and subcordata (blue and white Day Lily), Liatris (Blazing Star) scariosa and punctata, Lobelia cardinalis and syphilitica (Cardinal Flowers), Lychnis Chalcedonica (Maltese Cross), Lysimachia nummularia (Moneywort), for vases, carpets or rockwork; Mertensia Virginica (Virginia Lungwort). Yucca filamentosa and angustifolia, Vinca minor (Periwinkle), which will make a beautiful evergreen carpet where grass will not grow; Spiræa Aruncus (Goat's Beard), Sedum Sieboldii (Siebold's Stonecrop), Pyrethrum tchihatchewii, which will cover the soil if too poor for grass; but it ought to be in every collection on account of the "dimuition sweetness" of its specific name if for no other reason; an assortment of the French Lilacs (Phloxes), Pentstemons.

VITIS INDIVISA.

We know of no other catalogue of herbaceous plants that offers a more varied collection than that of Woolson & Co. of Passaic, N. J. The long list is one also which, so far as we are capable of judging, is absolutely correct as regards its botanical nomenclature. For the benefit of our readers we regret that their attention has not been called to this catalogue earlier in the season. This firm does *not* advertise in the Rural and is not likely to, for which reason our readers may deem that the above notice is made wholly in their interests. We notice, also, that the Climbing Hydrangea (Schizophragma Hydrangeoides) figured for the first time in this country in Rural of February 15, '79, is offered (small plants) at twenty-five cents each.

Improvement of the Tomato.

It is to be hoped that seedsmen will no longer advertise new varieties of tomatoes as "earlier than any others yet brought before the public." Such new varieties are no longer desirable. We have reached the *limit of earliness* in this important fruit except at the cost of some other quality more valuable than earliness. Up to the present time, the "Little Gem," if we may judge of it generally by our own comparative tests with all of the leading sorts, is the earliest tomato in cultivation. But it is "only this and 'scarcely' more." Watery, soft, quick to rot, sour, it really has no claim to a place in the garden except, indeed, for the *market* where anything that *looks* like a tomato will meet with a readier sale for being the first of the season. In the improvement of the tomato we should consider form, size, flavor solidity and keeping qualities.

The favorite Trophy, is too irregular and too large, and ripens imperfectly. It is, of course, late, though it keeps well and is among the best for canning purposes. The Acme is really a decided advance towards perfection Its shape and size are all that could be desired. Its lobes are so slight as to prove no hindrance to those who prepare it for the table, and it ripens evenly in every part. But in its flavor (which is too acid), solidity and keeping qualities there is still much room for improvement. The degree of acidity of tomatoes is, in a measure, due to the season; but it is in a greater measure due to too close planting, and to confining them too closely by stakes and hoops or strings, or to leaving them without support of any kind, in which case the vines fall upon the ground, and the fruit ripens beneath their dense shade.

We have not the slightest doubt that a more painstaking method of cultivation awaits this fruit (the ultimate value of which can only be guessed at by its rapidly growing importance), for the reason that the difference between the best and the poorest of tomatoes is as great as the difference between the poorest and best of any other fruit whatsoever.

Among the foremost steps to be taken are, first, to cast aside the *earliest* varieties altogether as worthless, and to select seed only from those of the best-flavored, firmest and shapeliest sorts; second, to treat the young plants differently in the seed-bed or frame. They are planted too thickly together, and become too drawn and enfeebled. Stockier plants, heavier stems and more roots would, no doubt, produce firmer and better fruit. Finally, we again recommend trellises for the tomato. Let them run north and south, and train the same as we would a grape-vine. By this method, as all of the fruit is exposed to, and ripens in the sun, the yield will be greater and the quality immeasurably superior.

CURRANTS FOR PROFIT.

I find that nothing pays better than Currants. The majority of people will not be at the trouble of dusting the bushes with a little hellebore, thus losing their fruit; yet nearly

every one needs and will have a few for jelly, jam, or for immediate use. The peculiar acid is invaluable in hot weather and almost every one craves it. I find no difficulty in selling all I can raise, at four dollars per bushel. At three dollars they abundantly pay. It is desirable to plant the white in preference to the red varieties, as they are not seen by the birds.

The most profitable varieties I should set down in the following order: White Dutch, Versaillaise, Cherry, Victoria. The ground should be well drained in order to prevent frost-heaving, as the bush is easily pried out when there is much freezing and thawing with little snow. My plan is to set the bushes in rows ten feet apart: and six feet in the row. Between the rows corn or any hoed crop may be planted. In the rows, plant beans or potatoes. Cultivate and hoe the whole ground. Always slightly hill the Currants at the second or last hoeing.

It is a good plan to have a patch of Gooseberries near the Currants. The worms will appear first on the Gooseberries, and can be promptly disposed of with two dustings of hellebore. They will then not appear to any extent, if at all, on the Currants. It is best to apply the hellebore when there is dew on the bushes. E. P. POWELL.

Pomological.

CERTAIN APPLES.

W. S. CARPENTER.

I SEND the RURAL a few notes respecting the Apples forwarded to it.

MONMOUTH PIPPIN.—(See cut from Mr. C.'s specimens). This Apple originated in Monmouth Co., N. J. It is about the size of the Rhode Island Greening. Color, pale-yellow ground, with a beautiful red cheek. Flesh juicy, fine, brisk, aromatic sub-acid. Rated by Downing very good to best. The tree forms a beautiful head, and bears good crops annually and keeps well. Ripens from April to May.

EVENING PARTY.—(See cut from Mr. C.'s specimens) This originated in Berks Co., Pa. The tree is a fine grower and a great bearer on alternate years. Fruit medium, yellow, lightly splashed and striped, with red; very juicy; remarkably tender, almost buttery, with a brisk saccharine, somewhat vinous, aromatic flavor; one of the best dessert winter apples.

Valuable Kinds.

I select the following from my collection, having tested them for several years. I think they are worthy of more general cultivation.

FANNY.—I received cions of this beautiful Apple from my friend Charles Downing, who informed me that he considered it a very promising Apple. The RURAL published a cut of this fruit some months ago. I will add that it is one of the most promising new Apples in my collection, bearing a good crop every year; an Apple of great beauty and very fine quality.

WASHINGTON STRAWBERRY.—I first saw specimens of the fruit of this fine Apple, in Boston, at the Horticultural show. In a collection of nearly 100 kinds, this was considered by the judges, one of the best. Fruit large; yellow ground, splashed, and mottled with rich red. Flesh yellow, crisp, very tender, juicy, mild sub-acid. One of the best Apples in my collection. The tree is a good grower, and bears fine crops annually. Fruit ripens from September to October.

TITUS PIPPIN.—Origin, near Hempstead, Long Island. Tree a strong grower; very productive and profitable for market. Fruit very large, pale-yellow, with a blush. Flesh yellowish-white, juicy, tender, brisk sub-acid. February to March.

STREAKED PIPPIN.—This originated in Westbury, Long Island, N. Y. Tree a strong grower and very productive. Fruit very large, shaded, splashed and striped, with rich red. Flesh yellow, crisp, tender, juicy, pleasant sub-acid, and aromatic. A very fine late-keeping apple. February to April.

RICHARD'S GRAFT.—Originated in Columbia Co., N. Y. A very fine Apple, worthy of extensive cultivation. Tree a moderate grower; very productive every year. Fruit medium; color, yellow, nearly covered with splashes, marblings, and shades of rich red. Flesh yellowish, very tender, juicy, pleasant, rich, aromatic sub-acid. One of our very best autumn Apples. September to November.

PRIMATE.—An old Apple, of unknown origin. Tree a good grower, and bears, annually, a good crop. The fruit is one of the most delicious and valuable summer sorts in the entire list. Fruit large, greenish-white, with often a crimson cheek. Flesh white, very tender, sprightly, refreshing, mild sub-acid. July to September.

NICKAJACK.—A very popular Apple in the Southern States, and one likely to prove valuable here. Tree a strong grower, and productive. Fruit large; color yellowish, striped, shaded and splashed with two shades of red. Flesh yellowish, compact, tender and juicy, sub-acid. It is a long keeper, keeping better than the Baldwin. March to May.

MOTHER.—Origin, Massachusetts. Tree moderately vigorous; a good bearer, every year. Fruit medium to large, yellow, nearly covered with rich red. Splashed and marbled with deeper shades; flesh yellow, tender, juicy, rich, aromatic sub-acid. One of the best of apples for the dessert. November to February.

LAWYER.—Introduced by George S. Park, of Parkville, Mo., and said to have been found in an old Indian orchard in Kansas. It has come into bearing with me, and promises to be very valuable. Fruit large, color, dark bright red. Flesh white, firm, crisp, sprightly, aromatic, mild sub-acid. It is a late keeper, keeping well up to May.

HUBBARDTON PIPPIN.—Origin uncertain. Tree a strong grower. Fruit very large, yellow, shaded and striped with red. Flesh tender, yellowish, crisp, juicy, mild sub-acid, aromatic. A very promising apple for market; keeps well to March.

HICK'S—Originated at Hempstead, L. I. Fruit large; color yellow, beautifully striped and splashed with crimson. Flesh whitish, tender, juicy, rich, sweet, aromatic. A fine and very handsome dessert apple. The tree bears every year. A new Apple of good promise.

BEAUTY OF KENT.—Originated in England. Tree a strong grower, and wonderfully productive. Fruit very large, often weighing a pound each; yellow, marked with large, broken stripes of bright red. Flesh juicy, crisp, tender, with a pleasant sub-acid flavor. An apple of good quality. Its large size and beautiful appearance make it one of the most profitable market apples I have yet seen. October to December.

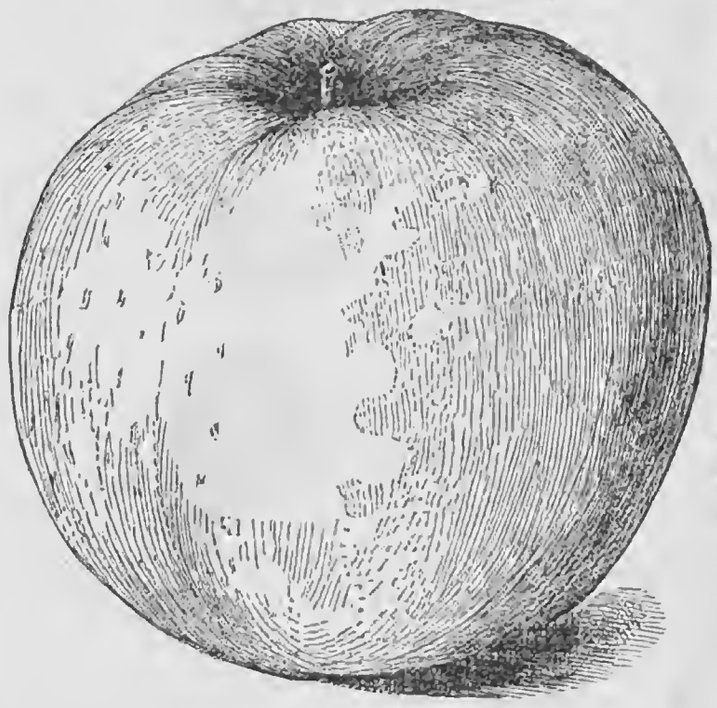
BAKER.—Originated in Connecticut. Tree very strong, and a good bearer. Fruit very large, yellowish, mostly covered with crimson; flesh yellowish, juicy, pleasant sub-acid, very good. This apple is highly esteemed for market, keeping to March.

PARK SPICE.—This valuable Apple originated in this county—Westchester, N. Y. Tree a strong grower. Fruit medium to large, whitish yellow, shaded with red, splashed and striped all over. It is a prodigious bearer, often breaking down with the load of fruit; flesh yellow, rather firm, juicy; mild sub-acid, aromatic, one of our best long-keeping apples. March to May.

MCKABE.—A seedling, originating in this neighborhood. Tree a good grower and bearer. Fruit, medium to large, yellow ground nearly covered with bright red, strongly resembling a good specimen of Spitzenburgh, and about as good. A very promising new Apple. March to May.

FERRIS.—An Apple of unknown origin, and perhaps but little known outside of Westchester Co., N. Y. The tree is a strong grower, a great bearer every other year and a moderate bearer in intermediate years. Fruit very large, shaded, splashed, and striped lightly with crimson. Flesh white, very tender, juicy, mild sub-acid. An apple of high quality. November to January.

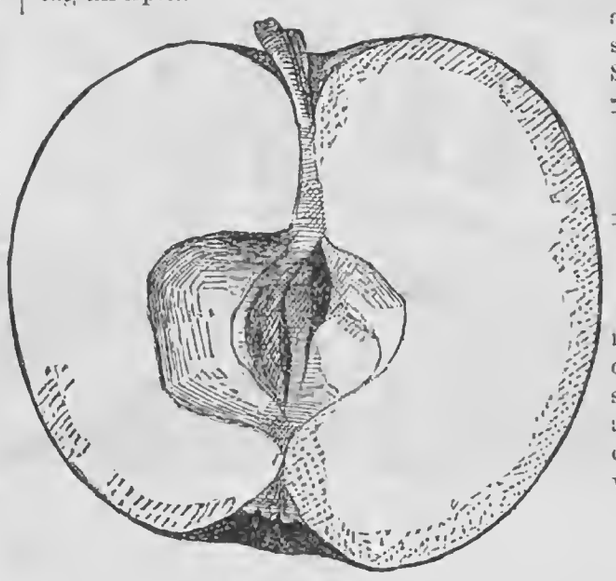
EARLY PENNOCK.—A Western Apple which is likely to prove of much value in eastern New York. Fruit large, light yellow, splashed, mottled and shaded with bright red. Flesh whitish, juicy, with a fine sub-acid flavor. A very promising summer Apple. Very handsome and productive. August to September.



MONMOUTH PIPPIN.

KIRKLAND.—I received cions of this fine Apple fifteen years ago. Fruit large, oblong, yellowish-white. Flesh yellowish, tender, sub-acid; a good table apple. The tree is a good bearer annually, and the fruit keeps till April.

BEN DAVIS.—A favorite Apple in Kentucky, where it is supposed to have originated. My trees have come into bearing, and the variety promises to be profitable here. Fruit large; color yellowish, splashed and striped with two shades of red. The Ben Davis is larger than the Baldwin, and hangs well on the tree. I think this is a promising market apple, keeping till April.



EVENING PARTY.

CORNELL FANCY.—Originated in Pennsylvania. Tree productive. Fruit medium; color, yellow, nearly covered with crimson. Flesh white, tender, crisp, juicy, with a fine sub-acid flavor. One of the finest early-autumn Apples. Rye, N. Y.

OPINIONS OF EXPERTS ON THE MONMOUTH PIPPIN AND EVENING PARTY.

IN reply to our inquiries as to the merits of these Apples, Charles Downing writes:

"MONMOUTH PIPPIN originated in the town formerly of Freehold, now Manalapan, Monmouth County, New Jersey, many years since, on lands of Kinneth Hawkins, now in possession of John R. Perrine, where, I am informed, the original tree is still standing. The tree is a vigorous grower, bearing abundant crops on alternate years, and much esteemed where well known. The fruit is of medium to large size, generally fair, of very good quality, keeps well, and is valuable either for the market or family use.

"The EVENING PARTY Apple is said to have originated in Berks Co., Pa., and is a pretty and pleasant fruit, of medium size, or less and valuable mainly for the amateur and for family use. The flesh is whitish, fine, tender, moderately juicy, with a peculiar mild sub-acid flavor, almost saccharine. It is in eating during December and January. The tree is moderately vigorous with numerous rather slender branches, requiring moderate pruning; the foliage and fruit adhere well and late to the tree, and the fruit should remain on the tree till well colored and matured, to have it in perfection. The tree is such an abundant bearer on alternate years, that if not well thinned out there will be much inferior fruit; so far it has not proved to be profitable as a market fruit."

T. T. Lyon, President of the Michigan Pomological Society, writes us:

"MONMOUTH (RED CHEEK) PIPPIN is so old a fruit that an expression of opinion respecting it (except, possibly, with reference to its success in Michigan) would seem to be little other than an invitation to criticism. Hence these remarks are to be understood as only intended for this State. My own experience with it would indicate that the tree is healthy, and generally satisfactory, although rather a tardy bearer. When old enough it is a medium bearer, generally each year, of fair, even-sized, beautiful fruit, by no means of high quality; but good and firm enough to prove satisfactory and even profitable as a winter market fruit.

"EVENING PARTY has much the appearance and quality of that old favorite, the Rambo. When the lamented Dr. Brinckle introduced it, he characterized it as strictly and peculiarly a dessert apple—a characterization in which I freely concur; although while we have Melon, Shiawassee Beauty, and even Jonathan or Hubbardston Nonsuch, in Michigan, we are not likely to greatly regret the absence of this. Indeed, I am unable to learn that, even in its native region, it has been able to attain any noteworthy prominence.

"I have reasons for the assumption that these, in common with most varieties, when carried far northward of their places of origin, lose something of quality, and possibly of size and color also."

C. W. Garfield, Secretary of the same Society says: "The MONMOUTH PIPPIN is a very promising market Apple for Michigan. It has been tested in nearly all parts of the State. In a scale of ten points it is marked in our Michigan catalogue seven for dessert, six for cooking and eight for market.

"The EVENING PARTY may have been tested, but we know very little of it for any purpose. I notice in our catalogue upon the same scale it is marked seven for dessert, four for cooking and two for market, but it has only been tested, so far as I know, in the eastern part of the State."

Floricultural.

PINKS. DIANTHUS.

THERE is hardly a class of flowers, excepting the Rose, that enjoys greater favor with lovers of flowers, than the genus Dianthus, with its several species and endless varieties. They are all valued for their showy many-colored flowers, their delightful perfume and the ease with which they are cultivated. The Chinese Pinks,

D. DIADEMATUS.

Dianthus Chinensis, D. Heddewigii, D. imperialis, D. diadematus, D. laciniatus and many other varieties, are cultivated as annuals, though they will bloom the second year if covered during the winter. They are excellent

D. IMPERIALIS.

for bouquets, for massing together in groups, and vigorous specimens are unsurpassed for pot-culture. The seed should be sown in boxes or in an open seedbed in the spring. When the young plants have a few leaves, they

D. HEDDEWIGII.

should be pricked about three inches apart on a nursery bed, and, later, transplanted to the group or flower bed with a ball of earth adhersing to the roots. They are set at distances varying with the size of the varieties, the dwarfs about six inches apart. They require a light rich soil.

D. CARYOPHYLLUS.

The Carnation Pink, Dianthus Caryophyllus, is cultivated for winter-flowering and is one of the florist's most staple plants for this purpose. The seed is sown as above; but the plants are set on a nursery bed until the fall, when they are taken up with ball, planted in pots and transferred to the house. They are also propagated by layering and cuttings. The latter are taken off during the winter or early spring and set in moist sand in the greenhouse where

the temperature is comparatively cool. In May they are planted in the open ground and treated like seedlings. The Picotee and the Garden Pink are varieties of D. Caryophyllus. They have both large flowers and differ mainly in that the Picotee has the stripes running around the edge of the petals, instead of from the base to the outer edge. They may be grown from seed; but to preserve the many excellent varieties, they are mostly propagated by layering. This is done in July. The lower leaves are removed from a young branch, and with a small, sharp knife a cut is made on the under side about half way through the stem, and then upwards, lengthwise about an inch. This portion of the branch is then bent into the ground and covered with about two inches of soil, the tongue cut loose pointing directly downwards. When the layers are rooted, they are cut loose from the old plant and in the fall planted in pots and wintered in a cellar or cold-frame. These are great favorites in Europe.

Dianthus barbatus, Sweet William, and D. plumarius, Plumed Pink, are very common throughout the country, especially the former. They are hardy perennials. The seed should be sown now; the young plants set on a nursery bed, and next spring transplanted to the border. The Plumed Pink grows low, and its petals are deeply cut so as to give the flower a feathery appearance.

The Garden.

WHAT OTHERS SAY.

About Seeds.—From Mr. J. J. H. Gregory's instructive lecture upon the "Culture of Vegetable Seeds," we make the following extracts, only regretting that we have not space for the lecture entire as given in the Report of the Secretary of Conn. Board of Agriculture: "The old, rough-hewn idea of farming was, that the foundation of successful agriculture was found in the manure-pile. We, in our movement towards accuracy, which we call science, have gone beyond that, or back of it, and we say now that it lies in the seed planted. . . . Hence we go back of all and say, first of all, give us good seed. . . .

"Of the seventy species of vegetables catalogued, less than twenty enter into the general consumption of the people, the remainder being mostly confined to the inhabitants of the large cities, and but rarely wandering outside the grounds of the market gardener. . . .

"Where the seed sold by American seedsmen is grown is, for the most part, a question of cost and of climatic condition. Of the seventy species of vegetable seed, more or less of over half the varieties are imported. Of mangold-wurtzel, about all; rnta-baga, about nine-tenths; spinach, about nine-tenths; cauliflower, nearly all; lettuce, about half; carrots, about half; egg-plant, about half; parsnip, about one-third; radish, about all, with the exception of those of Messrs. Landreth & Son, who practice raising their own. It is the general belief of American seedsmen that foreign-grown radish seed is larger and better than home-grown. Parsley seed is largely imported, Brussels-sprouts, broccoli, chickory, endive, kohl-rabi, and Swiss chard are almost wholly imported, as is salsify, to a large extent.

"Of celery, the finest varieties are grown in this country in the vicinity of our large cities. Of cucumbers, but a few, and those of the fancy-frame sorts, are imported. Of peas, most of the hard sorts are home-grown, and probably rather more than half of what are called the softer, or wrinkled varieties. The Dutch or rough-leaved turnip seed are all home-grown. Of cabbage seed but few varieties are imported, and these are confined almost wholly to a few early sorts. Onion seed is almost wholly an American crop. . . .

"There are certain vegetables that are peculiarly American, of which our English cousins know nothing, or next to nothing. There are over forty varieties of beans, forty varieties of corn, forty varieties or tomatoes, fifteen varieties of squashes, while of our fifteen or twenty varieties of cucumbers, and thirty-five or forty of melons, they know nothing, as an open-air crop. In England, the melons are all grown under glass, and cucumbers the same. They hang in glass-houses, as grapes hang here. I recollect, while there, going out to one of their great parks and seeing some large plants growing under glass, evidently carefully tended, and upon examining them, I found they had our common bush-bean,—one or two plants, I think,—under glass. They have no corn in England; they do not grow any squashes there worthy of the name, the vegetable-marrow being their standard of excellence, and almost their only variety; and whoever has traveled in England knows the poverty of an English table. Go to the best hotels, and you miss the delicious melons, sweet corn, cucumbers, and the great variety of other vegetables that are found on almost every table here. This brings up the question of the duties of the seed-dealer to the public. The box trade has demoralized the business greatly. When a man sends out a box of seed to be sold on commission, and has it returned to him, it is a severe strain on his morals to throw that seed away, if it is bad, or partly bad. He is very loth to come to the point of throwing that seed away; and, of course, if he sells it, the risk is on the part of the planter. A remedy for this evil would be to require the country dealer to pay for what he orders. In that case, the dealer would be likely to order only what he wants and can probably sell; whereas, under the present system, he orders indiscriminately, because he has simply to return what he does not sell, and takes no risk in the business. . . .

Mr. Gregory, in the course of his remarks, was questioned by several.

Professor Brewer asked: "In regard to drying seed, you will find many farmers who believe that they should be dried in the sun, and many others who believe they should be dried in the shade. I should like to know what Mr. Gregory's experience has been in that regard, particularly as there have been most elaborate rules published by the Agricultural Department, which advocated the drying of all seeds in the sun. While that may be true in England, is not the sun rather too hot here for the vitality of certain garden seeds?"

Mr. Gregory replied that he had no fear at all of sun heat on seed, so far as he had tried it, or of a temperature of seventy-five or eighty degrees.

Prof. Brewer said: "Seed spread on a cloth in a metal pan and exposed to the sun, as one will see farmers dry seed, will reach a temperature of 150 degrees, as can be tested."

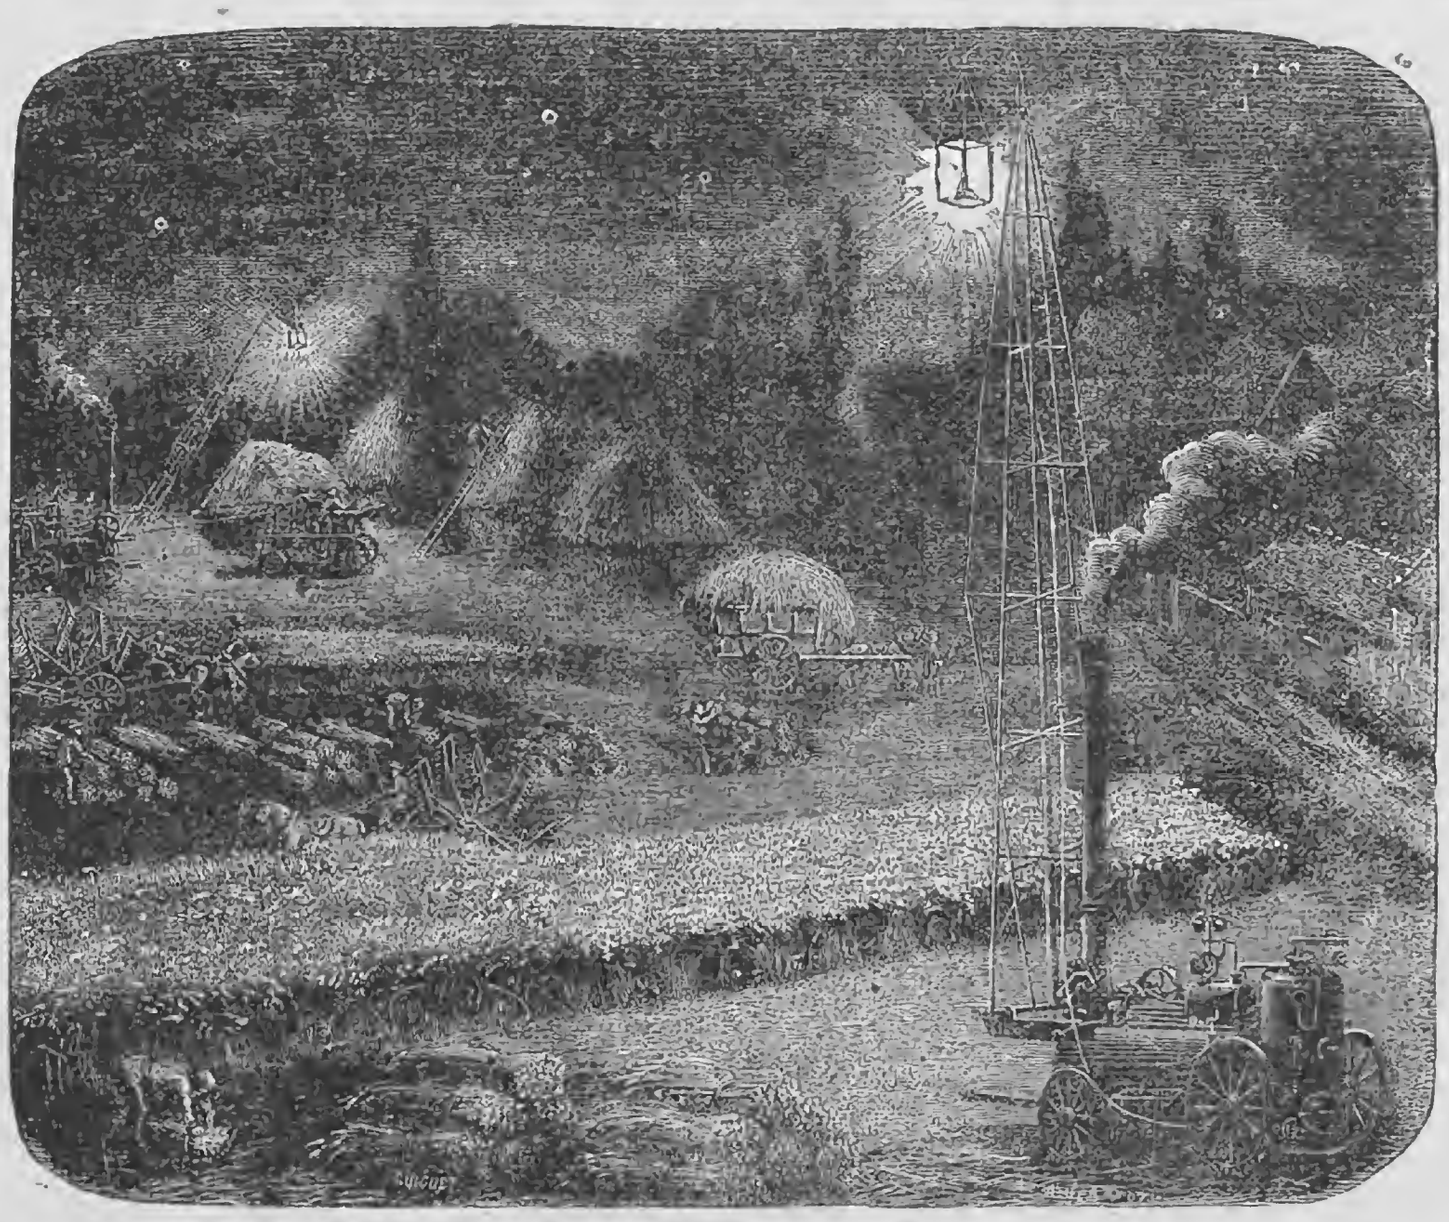
Mr. Gregory said that he should want to test seed dried in that way. . . .

Mr. Angur—"I have listened with a great deal of pleasure to Mr. Gregory's lecture, and I would like to ask one question. Many of us have the impression in saving seeds, if we take the seeds of the earliest tomatoes, for instance, that ripen, the tendency will be to give us early-ripening progeny; and so with beets and other things. I would like to ask Mr. Gregory's experience in that direction."

Mr. Gregory—"That is, I think, the tendency. That is the way we get our early kinds, by saving the seeds of the earlier vegetables. There is a tendency of 'like to follow like.' Let two men take the same strain, and one exercise care in saving early seed, and the other not, and you will find, in three or four years, that the crop of one ripens a week or ten days before the crop of the other. Any one can satisfy himself in regard to that."

Nearly at the close of Mr. Gregory's lecture, Dr. Sturtevant requested him to give the history of the varieties of American squashes.

Mr. Gregory—I will tell it in brief, as far as known. The Hubbard squash was brought into Marblehead when an old lady 90 years old was a little girl, by a dealer named Green, from Boston. One day he said to the mother of this lady, "Ma-am, you have been kind to me in many ways, and I have brought you a present." So he goes out to his wagon and brings in this



HARVESTING AT NIGHT BY ELECTRIC LIGHT.

curious squash, as she describes it, like a Chinese shoe. The aunt says, looking on: "Don't eat it, Jane! it is a gourd; it is poisonous." The man begged her to cook it, and if she did not like it, give it to the hogs. So, to oblige him, she cooked it, liked it, and saved the seed. That is as far as I can trace the Hubbard squash. We named it "Hubbard" in honor of the old lady who first brought it to our notice. The variety I named the Marblehead was sent to me from the West a few years ago. It was stated to me that the seed was bought in New York under the name of "Custard" squash, which name, as every seedsman knows, belongs to a variety closely allied to the vegetable-marrow squash, a very coarse affair of the pumpkin class. On planting the seed I found that the crop of squashes was just about the same as I had raised some years previously from seed brought home from the West Indies by Captain Stanley of Marblehead. The captain had so badly mixed his seed, growing it for years in his garden side by side with the Hubbard, I was unable to obtain it pure for introduction. This new-comer having no name of its own, I therefore called it the "Marblehead" squash. The Marblehead undoubtedly came originally from the West Indies.

Carnations.—Rev. H. W. Beecher tells the Gardener's Monthly that there is a prevalent notion that much skill is required to raise Carnations. Any man who can raise lettuce or peas can succeed with Carnations. He obtains the best seed possible; sows it thickly in rows, in June, as he would salad. It comes speedily. When about one or two inches high, prick it out upon a prepared bed, about eight inches apart and let it grow till frost comes, then very slightly draw earth enough to it to cover the collar, and let it alone for the winter. When he used to cover it with straw or brush he lost half his plants. But by leaving them open and unprotected they come through the winter without bleaching, and go to work early.

The great difficulty in blooming Carnations is the want of good seed. In some seasons, buying the best seed in market, he has not raised a single double. It does look as though foreign seedsmen sometimes adulterate their carnation seeds; for that it should be done in New York is not to be thought of.

Duration of Asparagus Beds.—We have known of Asparagus beds *twenty* years old, but Col. Curtis tells the N. Y. Tribune of one a *hundred* years old—"a pleasant reminder," he says, "of the thoughtfulness of ancestors." Those who follow this suggestion not with asparagus only, but with other lasting farm improvements, generations yet unborn shall bless.

Miscellaneous.

THE FUTURE OF AMERICAN FARMING

It is probable that in the near future the approach of storms of rain or wind will be announced by our Signal Service everywhere throughout the country. A forewarning of this kind would serve, even with our present conveniences, to greatly diminish the heavy losses entailed on the farming community by the unexpected advent of stormy weather. Approaching discoveries in science and the useful arts will doubtless enable farmers to turn such warnings to still greater advantage. The accompanying sketch of a field electric light shows one method by which the farmers of the future can hurry up farming operations on the approach of unfavorable weather. Nor will this be the only benefit derived from such a convenience; for whenever it shall be widely introduced, many labors in the fields, which are now wearily performed during the torrid heat of our midsummer days, can then be pleasantly done in the cool summer nights. Then again, such heavy and expensive machinery as thrashers, etc., can be utilized all the time in the busy season, by means of relays of men; and thus a considerably larger profit will be realized from the capital invested in them. Favorable spells of weather, too, can be utilized to the utmost and the evil consequences of a paucity of labor will be reduced to a minimum. There is no class for whom the future holds so much social and intellectual advancement; so much assured prosperity, and so much rational happiness as for those engaged in the various departments of agriculture, and in no country in the world are the farmers so well prepared as in this by intelligence, energy, enterprise and political as well as natural conditions, to pluck the earliest benefits from the treasures of the future.

CONNECTICUT AGRICULTURAL EXPERIMENT STATION.

BULLETIN 23.—March 11, 1879.

Analyses of Hay.

XLVIII. Cut first week in July, 1877. From dry, rich upland, plowed about forty years ago. Consists of fine grasses. Large amount of Kentucky blue-grass (*poa pratensis*), and timothy (*phleum pratense*). Considerable red-top (*agrostis*).

XLIX. Cut second week in July, 1877, from rich, moist upland. Mostly timothy and Kentucky blue-grass. Some red-top.

L. Cut last week in July, 1877, from rich moist upland. Mostly timothy. Some red-top.

LI. Cut last week in July, 1877 from moist upland. Mostly red-top and timothy.

LII. Cut first week in August, 1877 from intervale meadow, sometimes overflowed. Coarser than the preceding four. Mostly timothy and red-top, some red clover and white weed (*Chrysanthemum vulgare*).

LIII. Cut about the middle of August, 1877, from wet lowland, sometimes overflowed. Contains a good deal of sedge grass (*carex sterilis*), and some fern. Other weeds, such as brunella vulgaris. Very little timothy.

All the above were sent by Hon. T. S. Gold, West Cornwall. Except in case of XLVII the meadows have never been plowed or seeded.

LVII. Cut July 1, 1878, when about one-fourth part was in bloom. Very heavy, rank grass. Almost all timothy, a very little Kentucky blue-grass.

LVIII. Cut July 11, 1878. A half or more had ripened enough so that the seeds would scatter out a little in handling. The grass was of the same species as LVII.

LVII and LVIII, were both sent by J. W. Sanborn Esq., Hanover, New Hampshire, from the Agricultural College farm, and cut from the driest part of a fine heavy clay yielding two, and under good culture, three to four tons of hay per acre.

The water contents of these hays when received at the laboratory were as follows:

	Per cent.		Per cent
XLVII	14.86	LII	13.55
XLIX	13.08	LIII	15.08
L	15.38	LVII	8.97
LI	12.97	LVIII	9.29

All but the last two were received apparently in about the usual marketable condition.

To render the result comparable with other analyses on record, they are all reckoned on a

water content of fourteen and three-tenths per cent. For comparisons, are given Wolffe's averages of German hay from Menzel and Leugerke's Kalendar for 1879. See also report of this station for 1878, page 57.

Mr. Gold states that his samples stand in our list above, in about the order of their value, as judged practically, beginning with XLVII. The crops were light, owing to the weather of 1877. XLVII and LIII yielded not over one ton per acre. The others yielded one and a half to two tons. All were harvested at what was regarded as the right time or stage of growth except LIII which was let stand too long. The hay was of very good quality, as compared with that of former years, but contained a less proportion of timothy.

The two samples sent by Mr. Sanborn have been employed in some feeding trials, the results of which he will publish in due time.

It is thought by some authorities, that hay deteriorates on long keeping to a degree that affects its chemical composition. Although such a fact does not appear to be fully authenticated, it is possible that Mr. Gold's samples, which were received at the station in November 1877, and have been but recently analyzed, are not as rich nutritively, as when new. Mr. Sanborn's samples cannot have suffered seriously from keeping.

The most obvious result of the above figures is, that the New England samples are of inferior quality as compared to those of Germany and Austria which have been analyzed in the European Experiment Stations. Of forty-six of the more recent analyses which are given in Dietrich and Koenig's tables, 1874, the lowest figure for albuminoids is 7.6 per cent, the average is 10.1 and the maximum is 14.4. But one of the New England samples is above the German medium quality, and but three of them surpass or equal the inferior German hay in respect to albuminoids. The three samples produced on "wet lowland," LIII, or on land that "needs draining," LVII and LVIII, are most deficient in albuminoids. The early cut is scarcely better than the later mowed, as shown by analysis and the feeding records give no greater actual value to the former, while the early cutting is reckoned to diminish the crop on seventy-five acres by some twenty tons. These poorer hays are scarcely more than sufficient for the mere support of mature animals at rest, and require an addition of a proportion of highly albuminoid food, such as beans, linseed or cotton cake in order to make them economical fodder for growing, working or milk animals.

S. W. Johnson, *Director*.

CATALOGUES, &c., RECEIVED.

The Silk-worm, a manual of instructions for the management of silk-worms and the production of silk. This neat pamphlet of 38 pages is a report of Prof. C. V. Riley to the Commissioner of Agriculture on the above topics. It gives full estimates of the possible profits of sericulture, drawn from the labors of practical men; a full account of the different sorts of silk-worms, their food and general management, reeling of the silk, etc. To those who desire to raise silk-worms in this country for profit, there are three ways open: Either, 1, to ship the cooked cocoons to Europe; 2, to reel them here; 3, to raise eggs and sell these. More money has been made by the last method than by either of the others. Eggs raised here are free from disease and fetch as high as $6 or $8 an ounce in France, which paid us 114,000 francs for silk-worm eggs in 1876 and as high as 1,691,400 francs in 1877. These works are got up especially for the benefit of those interested in the subjects they treat of, and can be had gratis by our friends through their respective Congressmen.

Ellwanger & Barry, Rochester, N. Y.—It is rather late to make extended reference to the catalogues of this old and worthy establishment. The fruit catalogue presents the usual almost exhaustive list of Pears, Apples, etc, Among small fruits Sharpless's Seedling Strawberry is prominent. A colored plate is presented of the Crimson Tea Rose, "Duchess of Edinburg."

Among many new or rare plants we find the Double Purple Wistaria, the flower of which is shown in the accompanying engraving. Until the present season we have never had the plant in our collection. Messrs. E. & B. speak of it as follows: "A rare and charming variety, with perfectly double flowers, deeper in color than the single, and with racemes of remarkable length. The plant is perfectly hardy, resembling the Wisteria Sinensis, so well known as one of our best climbing plants."

DOUBLE WISTARIA.

Fish Culture in North Carolina, is another of the useful pamphlets used by L. L. Polk, the energetic Commissioner of Agriculture of the Old North State. The present brochure of 26 pages is a report on fish culture by S. G. Worth, and would be of interest and utility to other sections of the country also. Is the day far distant when the fish-pond shall be as common as the orchard near the farm-house?

Sheep Husbandry in the South, an instructive pamphlet of 130 pages, issued by the Department of Agriculture, Washington, D. C. Most of the information has been compiled in the Department, but to it is added an article by Jno. L. Hayes, Secretary of the National Association of Wool Manufacturers. Every one interested in the subject should write for the work at once to the Congressman of his district.

Early Amber Cane, a paper from the fifteenth annual report of the Massachusetts Agricultural College, by Prof. C. A. Goessmann. Boston, Rand, Avery & Co., 117 Franklin St. Here are 15 pages full of information very useful to those interested in sorghum culture.

D. M. Ferry & Co., Detroit, Michigan.—A costly catalogue of seeds and plants of 144 pages within highly illuminated covers. A bewitching colored plate of Pansies and another of their new Tomato, "Triumph," which is as round and smooth as an apple and as red as—as a new brick, are among the showy parts of this work which are first to strike the eye.

Catalogue of imported and thoroughbred Ayrshire cattle, the property of J. D. W. French, North Andover, Mass.

Report of the Central Board of Agriculture of Nova Scotia for 1878. A bulky pamphlet of 179 pages full of interesting local statistics and other information.

T. C. T. Thurlow's Address before the Essex Agricultural Society, at Lawrence, Mass., Sept. 25. 1879.

Catalogue of Trotting Stock, the property of B. J. Tracy, Ashland Park, Lexington, Ky.

RURAL SPECIAL REPORTS.

(Continued from page 267.)

New York, Whitney's Point, April 11.—We have had five days excellent "sap weather." Clear and warm; wind in the W. N. W. Snow has nearly disappeared from the hills facing the southwest, but is still quite deep in the woods facing the east and northeast. Wheat looks very well. Butter is selling at 14c. per pound; eggs, 11c. per dozen; veal calves, alive, $2.50 to $4.

A local paper has compiled, from the census of 1875, some figures, a condensation of which will be of interest to readers of the Rural. The first table gives the average product per acre for some of the leading staples, for the county having the largest average, for Broome county, and for the State at large.

	Largest.	Broome.	The State
Hay, tons—Herkimer	1.35	1.12	1.13
Barley, bush.—Saratoga	32.87	24.82	22.83
Buckwheat—Steuben	19.99	17.40	15.14
Corn—Yates	47.82	34.04	32.33
Oats—Monroe	36.97	30.93	28.59
Rye—Herkimer	21.63	11.46	11.82
Wheat—Kings	24.11	14.73	16.16
Potatoes—Kings	153.64	110.81	102.22

In the following table is given the average number of pounds of butter per cow per annum, in fifteen counties, which take the lead in amount of product—two and a half pounds of cheese, or three gallons of milk, are estimated as equivalent to one pound of butter:

Orange	172	Broome	139		
Westchester	144	Cortland	136		
Wayne	142	Putnam	136		
Delaware	142	Onondaga	135		
Chautauqua	141	Tioga	134		
Tompkins	141	Jefferson	132		
Queens	140	St. Lawrence	131		
Dutchess	139	The State	124		

The following table gives some miscellaneous agricultural statistics for Broome county:

Number of farms	4,837
Area, acres	422,669
Value of farms	$18,507,899
Value of buildings, other than dwellings	2,005,141
Value of stock	2,436,770
Amount gross sales, 1874	1,752,829
Area plowed, acres	47,165
Area in pasture	116,573
Area mown	94,450
Hay, tons	105,913
Number cows	27,943
Butter made in families, lbs	3,608,435
Number horses	10,983

Of course the work of the average census enumerator must be taken with some grains of allowance, but even then the figures afford food for reflection to our farmers. M. B. D.

North Carolina, Brookston, Warren Co., April 14.—So far, April has been cold. There have been several severe frosts, and one morning the ground was frozen in places too hard for plowing. Peaches are much injured and our highest hopes can only look for a short crop. Other fruits are safe. Farmers are well along with their work. Corn is mostly planted, and now we are preparing for cotton. Notwithstanding the low price, the full average acreage will be planted. Several farms are changing hands, nearly all the purchasers being planters who have been growing fine yellow tobacco on rented land, and have made money enough in two or three years to buy good farms. These bright wrappers can only be made on light sandy soil, with a light-colored and somewhat porous sub-soil, which is included in but two or three counties; and should the demand for that quality of tobacco continue at anywhere near the present prices, the lands on which it can be successfully grown must advance in price. Much more will be planted this year than heretofore. More knowledge and skill are required than in growing red tobacco, all through, from sowing the seed to marketing. Thus the crop cannot be left to the care of the ordinary darkey, consequently there is not much danger of over-production. M. B. P.

Texas, San Antonio, April 7th.—Our spring thus far is very dry—little or no rain since November. Grass in the heavy land is very poor, but in our immediate locality, amongst the "Black Jacks," on loose, sandy soil, it is fine, and stock fat. But our grass is always better here than on heavier land. Last year the growth was very heavy and this winter we have had lively work, fighting fire. All early-planted crops look well, but owing to its being so dry, many have not planted yet, but our season is long. Fruit looks well. We have some peach trees one year old from the seed, which are full of fruit. (?) Our climate is generally very healthy, and the heat is not so oppressive as a New-Yorker would suppose. We had a setting of Brown Leghorn eggs brought from Central New York last summer in a trunk, and all the "baggage-smashers" on the route could not keep mine from hatching. Chicks from them commenced laying at the age of four months. They are a success, but oh! how mischievous! Mona.

New York, Rye, April 12.—As spring opens many sad sights meet my view as I pass through my garden. My Rhododendrons have suffered greatly. (Ours have likewise. Eds.) Some of the new kinds I imported three years ago from Anthony Waterer, have proved hardy for two winters, but are now nearly killed, buds and leaves all destroyed. Joseph Wilworth, H. W. Sargent and Caractacus have suffered much, and I fear I shall have to give them up. They are all beautiful kinds. H. H. Honeywell, Scipio, Mrs. John Clutten, Charles Bagley, Charles Dickens, Lady Armstrong, all of which I imported three years ago, are in fine condition. Last spring I wrote to Anthony Waterer, of England, the originator of these fine Rhododendrons, that they had passed through two winters in fine condition. He now wishes to know how they look this spring, and with the Editors' permission I will do so through the Rural. W. S. C.

[Please do so.—Eds.]

Chateaugay Basin, Hillside, Quebec, April 11, 1879.—The weather here is very unpromising. On this Good Friday the ice is strong on river and lake. We have snow-drifts ten feet deep in front of the door and *not one bare spot* in the garden. Yet, true to the promises, yesterday the children heard robins and saw one of them in the vicinity of "last year's nest." Some days the thermometer goes above freezing point; but there are many mornings when it is only 15 deg. above zero. To show the variableness of our seasons, I may state that last year we had asparagus for dinner on the 17th of April. A. L. J.

New York, Flushing, L. I., April 13.—How has the winter treated the Experimental Grounds' evergreens? Ours are much injured by frost and sun, especially the Hemlocks. Many kinds of Rhododendrons also are looking badly. Japanese Maples, however, have stood the test bravely—nothing better; nor do any complaints of them come in. S. P.

Farm Topics.

WORK IN MAY.

NEED OF THOUGHT AND FORESIGHT.—As in April, so in May, there is much to be done. There will be a constant temptation to hurry and overwork, and not to do everything well. This is not economy in any sense of the word. Take time to think over everything before attempting to do it. Look ahead. When one piece of work is done, think what next, and then what is to follow that; and will these all go off smoothly and to good advantage. Every man should consider his circumstances and his materials to work with. He should study the nature of his soils and his markets and raise such crops and such stock as are best suited to his situation. If his soil is thin, he will not plow deep and turn up the poor subsoil to the surface. He may stir up the subsoil and leave it where it is. If his soil is deep, rather heavy or good for a foot or more, he will occasionally, at least, plow very deep and get larger crops by so doing. He will use good judgment every time, and not adopt any one set of inflexible rules.

MEADOWS.—Before the grass starts, pick up all the stones and loose stumps, or stick stakes by them that the mower may be safely used. Sow plaster, and top-dress the poorest patches, at least, with a little manure. We know of one man who has derived great advantage from mulching his meadows with materials from old straw stacks. Bone-dust is worth trying and many other fertilizers. Keep off the cattle and sheep in spring.

INDIAN CORN, OATS AND BARLEY.—The oats and barley are sown early in May, or earlier in some portions of our country. With these two crops, wheat succeeds best after barley. Try a piece of peas or beans instead of summer fallow and sow to wheat. Indian corn goes in about the 10th of May, in many States at the North. The soil should be well warmed first. There is nothing gained in planting very early. The corn should be well cultivated before it is planted. By this we mean, it is the best way to cultivate and pulverize the soil nicely before planting. The work can then be done to the best advantage. There is nothing in the way. Too few men think of this when fitting the ground.

CALVES.—The calf is "father to the ox." As the calf is, so will the mature animal be, good or poor. A calf well summered is half wintered. Calves want milk, but the quantity can be reduced by using middlings in the milk. Begin moderately by using a few spoonfuls at each feeding. Allow them good, rich pasture. Flax-seed tea or oil-cake meal is excellent to use in small quantities. A calf should be kept growing all the time till it reaches maturity. Winter and summer, there should be no halting.

SHEEP.—They should go to grass gradually to prevent disease. They should be tagged and looked after every day. Most wool-growers have decided that it is best to shear early and not wash the wool while it is on the sheep. Early shearing stimulates an early growth of wool, and a larger clip is obtained than when cut in June or July. The fleece should be done up rather *loosely*, and tied with small twine in moderate quantities. The tags should be carefully washed and kept in a separate lot.

PASTURE.—The grass should be allowed to get a good start before feeding begins, and then it should be allowed to keep the start all summer. Some soiling crop, as corn or barley or millet, should be started to feed when dry weather comes on. In our climate, it is well to remember that pastures nearly always fail or run short for a month or so some time nearly every year.

THE ORCHARD AND VINEYARD.—The former needs constant attention if it is expected to produce something for the use of the land. A young orchard may be planted to corn, potatoes, beans or some hoed crop, but never to a sowed crop, like wheat, oats, barley or grass. Feed the land unless it is naturally strong. Raise up grape vines and tie them in place before the buds start. Cultivate early and often till about the middle of August.

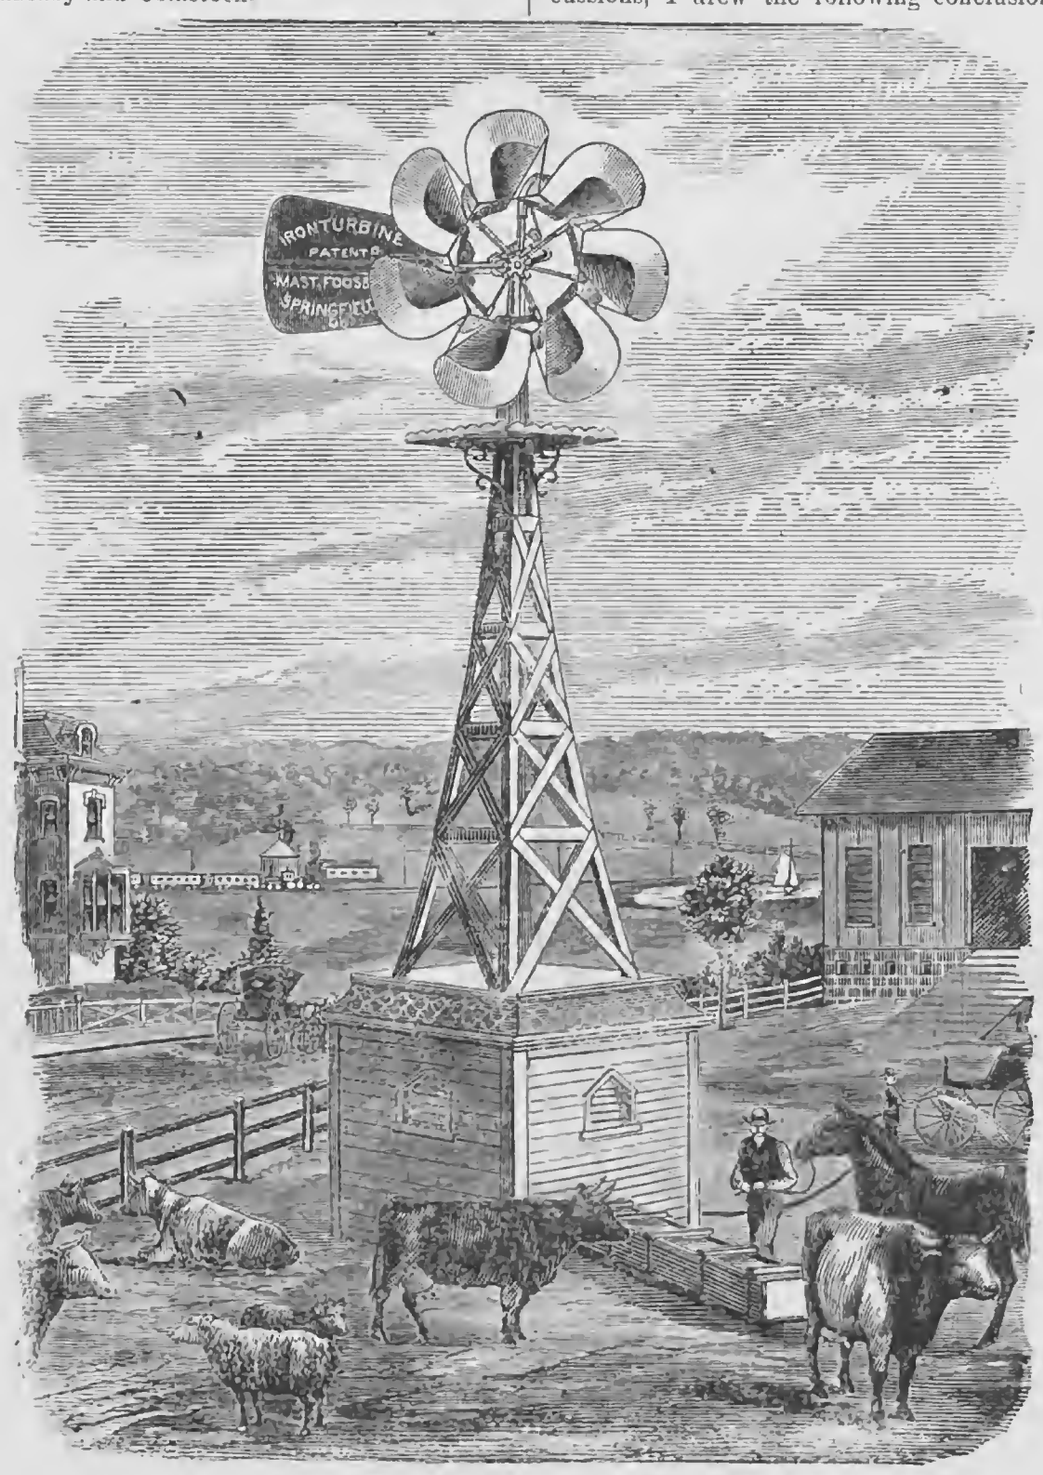
THE VEGETABLE GARDEN.—Many people never know the luxury or value of a good vegetable garden. They live from youth to old age without learning how to manage one. They never taste the best products except at the tables of others. People are too apt to forget to plant a succession of vegetables. The soil must be rich, the land well cultivated every week or oftener. We need not here repeat the special directions for the time of sowing and the treatment of each vegetable. Every seed catalogue gives these directions; and a catalogue can be had for a postal card. Plants which thrive only in warm weather must not be put out too early. Wait till the sun comes out hot. Tomatoes, squashes, sweet potatoes, corn, egg plants, will grow then as if by magic

EVERGREENS.—These are best transplanted in spring when the buds are pushing. Do not forget the thorough cultivation.

REPORT OF SORGHUM AND BEET-ROOT SUGAR MAKERS' CONVENTION.

Gen. Le Duc has high hopes of sorghum sugar; Prof. Caldwell by no mean dispairs of sugar beets; Mr. Stewart tells of his experiments in crystalizing cane sugar; an interesting discussion and conclusions drawn therefrom.

The Convention called to meet at the Courthouse in Elmira on the 10th inst. assembled at 10 A. M. Pres. Hoffman in the chair. The meeting was well attended by practical men of the immediate locality with a goodly number from a distance, Cornell University being represented by Profs. Roberts, Caldwell, Lazenby and Comstock.



NEW IRON TURBINE WIND MILL.

Naturally, the central figure was our Commissioner of Agriculture, Gen. Wm., G. Le Duc, who spoke in an informal way for several hours, answering many questions in regard to the details of raising various plants adapted to the production of sugar. He also set forth in plain and forcible language, the benefits to be derived from adding a new industry by which we might retain the large sums now paid to foreign nations for that indispensable article, sugar. While giving statistics in regard to the constantly increasing industry of growing and manufacturing the sugar beet in other countries, he called particular attention to the advancement that had been made during the last few years in the crystallization of the sorghum product. Although little had been said, the work had gone on, until, he believed, it was an assured fact that the cane sugar in sorghum could be as easily granulated and refined as the product of the true sugar cane or beet.

Prof. Caldwell spoke of several analyses which he had made of beets (as yet unpublished) and said that some years since he had tried to awaken an interest in this subject, but had failed to interest capitalists sufficiently so that they would embark in the undertaking. His opinion was, that the sugar beet is the most promising plant yet tried for Northern localities, but that it is not yet settled that sugar at present prices can be profitably manfactured from it, in this country. He urged repeated and thorough trials which he trusted might result in establishing a new industry on a firm basis.

Mr. F. L. Stewart of Murryville Pa., gave an account of some interesting experiments which he had conducted in making sugar from both cornstalks and sorghum, and claimed that he had discovered a method of treating the expressed juice of both plants while evaporating it, by which from eight to nine pounds of good brown cane sugar could be produced from a quantity equal to one gallon of deuse sirup. Prof. Englehart, of Syracuse, read a paper composed largely of valuable statistics which are for the most part available in various published forms. Prof. Roberts gave his experience as to the cost and methods of raising sorghum, beets, and mangolds, and compared the cost per acre with that of corn. Many questions were asked and discussed some of which proved too knotty for an accurate solution at the present.

Of these, the following are fair samples:

How much is a fair yield of gross product per acre of sorghum or beets? What is the average per cent. of cane sugar in the raw product? What is the average net profit to the farmer? While these with many other questions could not, in the nature of the case, be answered with certainty, yet from the discussions, I drew the following conclusions:

That the cost of producing an acre of sorghum is equal to that of two acres of corn; that it costs three times as much to harvest the former as the latter; that land which will produce good corn is adapted to sorghum and will give a good yield without extra fertilizers; that a good average yield is 160 gallons per acre of sirup, weighing 13¼ pounds per gallon; which is, under favorable circumstances, composed of cane and grape sugar in the proportion of seven to three; that from this we can obtain (if Mr. Stewart is correct) from seven to nine pounds of cane sugar per gallon. But our best chemists claim that in practice, this amount cannot be obtained, as no method has been discovered by which grape sugar can be converted into cane sugar.

The discussion also led to the conclusions: that the prospect is encouraging that sweet corn may be very profitably raised by using the ears in a milky state for drying and working the juices of the stalks into sugar; that these sugar plants are peculiarly adapted to localities of meager summer rain-fall; that the sugar-beet requires a rich, friable, loamy soil not full of undecomposed vegetable matter, and that, if the refuse is returned to the land, no exhaustion of the soil takes place; that if root culture becomes common in our rotation, it will materially improve the crops that follow: that the cost of raising roots on a given area is nearly three times as great as that of raising corn, with present methods, and that we have yet much to learn in economical production; that there is no difficulty on limited areas in getting an average yearly yield of 20 tons; while on large areas the yield may sink to 15 tons and on extra-fertilized small pieces it may rise to 30 or even 40 tons; that the manufacturer can afford to give $5 per ton for beets raised under proper conditions, which will result in a handsome profit not only to purchaser but producer.

The general feeling among farmers is, that most farm products are now selling at or below cost of production, and that a new industry which promises so well, and which, if successful, would furnish employment for idle labor and hoarded capital should be fostered by both national and State governments; that instead of building jails and poor-houses we had better be employed in building sugar mills; that the investigation of the intricacies of sugar production and the appropriation of money therefor, are far higher labors for the true statesman than the investigation and spending of money for——well—something that we already know all about. R.

The Apiarian.

PROVIDE HONEY PLANTS FOR PERIODS OF SCARCITY.

THERE is a period after white clover and bass-wood flowers have disappeared, from about the middle of July till some time in August, when bee pasturage becomes very scarce. This is particularly the case in dry seasons and in districts not favored with honey plants.

The beginner in bee-keeping may not be aware of this fact, or of the disadvantages that follow; we therefore offer a few suggestions as to how these may best be obviated. Whenever bees are compelled to live on reduced rations, the activity of the colony falls off. The queen stops laying, and the rearing of young bees consequently cannot go on. But the breeding should, under all circumstances, be stimulated at that season, so as to have a large army to gather honey from the fall flowers, and to make the colony strong for wintering. Bee-keepers, therefore, during this period of scarcity either feed back part of the honey gathered earlier in the season, or supply the needed pasturage by cultivating plants that will furnish a continuous bloom.

Feeding does well enough; but it is not the normal state of bees to require feeding. They are active, independent creatures that can be in a perfectly thrifty condition, and perfectly happy—if we may use the expression—only when they gather nectar from the stores of nature. And, besides, feeding causes some trouble and a loss of honey which they have spent time and work in gathering and the bee-keeper in extracting. The best plan is, therefore, to provide a pasturage to carry them through periods of scarcity. There is a large number of honey-producing plants that might be cultivated for this purpose, many of which we have tried: we shall, however, recommend only those we consider to be most valuable.

These are Mignonette, several members of the Mint Family and the Cruciferæ. Mignonette, *Reseda odorata*, is probably the best one of all, on account of its furnishing a continuous bloom from June until checked by the autumn frosts. It is very profuse in its yield of nectar and has the additional quality of perfuming the air most deliciously over a large area. Next in value we should put the members of the Mint Family, and of these especially Catnip, *Nepeta Cataria*, and Motherwort, *Leonurus Cardiaca*. These do not bloom so long as the Mignonette, but while they last they are perhaps richer in nectar than the latter. We have seen no plant so frequented by bees as the Motherwort, and that at all times, wet and dry. The cruciferous plants, Mustard and Rape, are also good. Rape blooms the earlier, and as it is in flower in about four weeks from the seed, it can be made to furnish a continuous pasturage from June till frost. Seeds of these should be sown now near the apiary, on a patch varying in size with number of colonies, from a few square rods to one acre. Prepare the land well and sow them all in rows; Mignonette about seven inches apart, the Mints and Rape nine inches, and tall Mustard 18 inches apart. Catnip and Motherwort are perennial.

There are but few flowers to bridge the period from fruit blossoms to white clover. The Honey Locust blooms then and also White Sage. The latter might be cultivated without much trouble.

Industrial Implements.

THE NEW IRON TURBINE.

As the value of wind-power becomes better known, farmers and suburban residents begin to appreciate and avail themselves of its advantages. As the demand has increased, inventors have set to work improving on the old-fashioned wind-mill until at present one would never—that is, hardly ever—suppose the latest improvement—the Iron Turbine Wind Engine—bore any relation to the flapping monstrosity against which Don Quixote shattered a lance. The greatest objections to wind-mills have been their proneness to blow over in a gale of wind, the insufficient quantity of water supplied during the calm months, owing to slow motion in light winds, and that ordinary wear and tear rendered them useless in from two to five years. The subjoined engraving of a wind-engine made by Mast, Foos & Co., Springfield, Ohio, is novel in almost every respect and combines many excellent features. The entire machine is made of iron, well braced. The turbine principle carried out in the wheel gives great power, and as the whole apparatus is fitted with extreme nicety, it is compact, durable, not apt to shake to pieces in a high wind, shrink or rattle. Nothing is added to its weight over that of other mills because it is made of iron, so there can be no objection on that score.

The machinery, or engine proper is constructed of the best materials and careful attention is given to details. The explanatory diagram of this wind-engine now before us gives a very clear idea of its construction and we think it would interest our readers to send for it if only to note the improvement in this class of machinery.

The Querist.

ANSWERS TO CORRESPONDENTS.

Queries about Stock.

P. E. K., Hutton's Switch, Md., has a mare with a swelling on the inside of one of her hind legs, extending partly to the hock joint. The cords extending upwards on the inside of the leg seem feverish and swollen. For three weeks she had not been working, and about 10 days before he wrote the swelling appeared without any premonitory lameness. She had the "scratches" during the winter, and is not entirely rid of them yet, and is heavy with foal, and he asks a cause and remedy for the ailment. 2. He has a horse that is an inveterate kicker in harness but quiet in other ways, and he inquires whether there is any cure for a kicker. 3. He asks whether rye bran feed will injure ewes that have yeaned.

Ans.—1. The injury is a sprain of the perforans tendon and is usually called *thoroughpin;* it was possibly caused by running or jumping while in the field. A sprain is best treated in its early stages by cooling applications to remove the inflammation; these may consist simply of cold water, of a solution of common salt in water, or of more complicated and costly mixtures, such as tincture of camphor and tincture of arnica, of each two ounces, tincture of iodine one ounce, to which one drachm of iodide of potassium has been added; alcohol, three ounces. This may be mixed with an equal quantity of water when used. It is sometimes necessary to give a purgative (Barbadoes aloes, four drachms) and follow with nitrate of potassa in half-ounce doses, three times a day, for a few days, to fully subdue the inflammation. Then blister repeatedly till all lameness is removed with cantharides ointment (one part cantharides to five of lard). The so-called blood sprain is a distension of the joint, the swelling appearing on its forward and inner surface. 2. Kicking in harness is a difficult habit to overcome; it requires good horsemanship and considerable practice, and even then such a horse is seldom safe afterwards. 3. Rye bran is no more injurious than other articles of food of the same class (bran); if fed in considerable quantities it will be better to mix it with corn-meal.

Restoring "Strong" Butter.

Subscriber, Plattsburg, N. Y., has 10 tubs of "strong" butter, and he asks whether it can be worked over and made fit for use.

Ans.—"Strong" or rancid butter cannot be fully restored to its original sweet, aromatic condition; but the rancid taste may be removed and the butter be so improved that it will pass for a second-class article. There are several ways of effecting this object. First, is that known as the Robbin's method. According to this the butter is first thrown into a tub constructed for the purpose, and from a reservoir placed above, warm water at a temperature of a 100° Fah. is allowed to fall in a shower upon the mass until it assumes a melted form. Then it is stirred to separate the buttermilk and other impurities, when a stream of cold water is showered over the mass until it takes a firm consistency. The butter is then laid on a butter table and fine salt worked into it by means of a corrugated roller. Second: rancid butter may be improved by churning it in fresh buttermilk, and if the butter is only slightly affected, it may in this way, with proper manipulations, be made palatable. After the churning, however, it must be again treated in the usual manner, to expel buttermilk, etc. Third: butter which has become quite rancid, can be restored to good flavor by softening it with warm water—say about the temperature of 100° Fah.—and then stirring it thoroughly in a quantity of sour milk. The acid condition of the milk is supposed to act chemically in taking up or removing the rancid flavor, in the same way that it serves to remove the flavor which is often imparted to the milk of cows fed upon turnips, and, at the same time, the milk imparts its aroma, thus tending to restore the flavor that belongs to freshly-made butter. Afterwards the butter must be worked, salted, etc., like fresh butter. Want of space prevents us from mentioning other methods.

Raising an Osage Orange Hedge, etc.

M. U. S., Stryker, Williams Co., Ohio, asks, 1, what pearl millet is used for: 2, how to plant and tend an osage orange hedge.

Ans.—Pearl millet is a forage plant, as we thought every reader of the RURAL knew. The grain is excellent food for chickens as well as for all kinds of stock. 2. The strip of land where the hedge is to be planted should be plowed in the fall and again in the spring. Plants can be procured from a nurseryman at less expense than they can be raised by the ordinary farmer, as they only cost from about $1.50 to $5 a thousand, according to size. When the land is ready, stretch a line to get the row straight, and set the plants with a hoe about 10 inches apart. Dig a hole for the first plant, which place in it at an angle of about 45 degrees, and with the hoe cover the roots with soil, taken from the hole of the next plant, and so continue till the line is finished. It is very essential that the hedge should be close at the bottom, and it is with this end in view that the plants are set at an angle. Keep the ground cultivated and mellow on both sides of the hedge. All weeds springing up in the row should be removed, and if cattle are running at large, the hedge should be protected with a fence. Next spring replace all missing plants with extra-strong ones; keep cultivating and allow them to grow undisturbed for three years. In the spring of the fourth year cut off the hedge a few inches above the ground and that summer it will make a growth which ordinary cattle will not have courage to break through. After this it must be kept in check with the shears, aiming to make it broad at the base and as tight as possible.

Precautions Against Sunstroke.

H. K. M., West Mansfield, Ohio, asks what is the best way to prevent sunstroke while working in the fields.

Ans.—Wear a broad-brimmed hat with ample ventilation, and on hot days carry in its crown a wet handkerchief, a fresh cabbage leaf, or something else of that sort, to keep the head cool. The use of liquor, over-exertion and mental excitement are all promotive of sunstroke and should be avoided in the heat of the day. Whatever tends to keep the body, and especially the head, cool, should be adopted and all that promotes heat, should be shunned. Most cases of sunstroke occur in the afternoon, partly because that is the hotest part of the day, and partly because the subject has been generally laboring for many hours and his vital powers are more or less exhausted; accordingly more care should be exercised then than at other times during the day. The attack is not always sudden; sometimes there are premonitary symptons, such as pain and a feeling of fulness in the head and oppression at the pit of the stomach, sometimes accompanied with nausea and vomiting and a feeling of weakness in the lower extremities, vertigo and dimness of vision. In all such cases the subject should at once discontinue labor, seek the shade and have the head and neck bathed with the coldest water obtainable.

How Strawberries and Raspberries "mix."

N. B., Brandon, Vt., asks, 1, if different varieties of Strawberries or of Raspberries trained to trellises, be set three feet apart, whether the blossoms will so fertilize each other as to change the general appearance and taste of the berries; 2, if so, how far apart should they be placed to prevent "mixing." He wishes to find out which varieties are best adapted to his soil and climate.

Ans.—There would be no perceptible change either in appearance or taste. Crosses would occur without doubt, but the seed alone would be notably changed, and this would manifest itself only in the fruit borne by plants raised from such seed. Of Strawberries we would mention Hovey's, Wilson's, Triomphe de Gand, Agriculturist. We would recommend you to *try* also Sharpless's Seedling and Cumberland Triumph. Of Raspberries, Davison's Thornless, Cuthbert, Gregg, Mammoth Cluster.

How to Bud in Summer.

L. B., Washington Co., Mich., asks if budding cannot be done in the spring as well as in the summer.

Ans.—The trouble is to get *buds*. Cions may be cut off now and placed in a cold room or ice-house, and if kept uniformly moist so as to prevent them from shriveling, buds from the cions may be used later.

Miscellaneous.

S. W. H., Metuchen, Middlesex Co., N. J., says: "My sow dropped 10 live, plump pigs and then died within an hour. For a week before she littered she seemed weak in the limbs. She discharged a mass of coagulated matter resembling beef lights immediately before the after-birth. Though not very fleshy, she was in good condition. What ailed her?"

Ans.—Probably uterine hemorrhage previous to pigging caused the weakness, and so reduced the sow that she had not sufficient strength to rally from the exhaustion of labor. The hemorrhage might have been caused by a fright, a strain, jam, or other injury.

B. F. McC., Carroll Co., Md., has a compost of equal parts of well rotted hog manure and hen-house droppings, well mixed together, and asks whether the same quantity of slaked wood-ashes would be a benefit or not.

Ans.—If the wood-ashes are mingled with the mixture before it is ready to be applied to the crop, they will liberate the rich ammonia of the hen manure, and most of it will escape. But if the ashes are added just before the mixture is used, it will be a decided advantage, as the soil will then retain the liberated ammonia until it is taken up by the crop.

N. C. D., Mt. Airy, Ohio, asks what are malt sprouts.

Ans.—The refuse grains that remain after the wort and the subsequent water are drawn off from the mash in brewing. The are called "sprouts" because in "couching," the second stage of brewing, the fibrils of the radicle sprout from the tips of the kernel, and, 24 hours later, the plumule appears at the same point and turns back under the husk, towards the end of the seed, where it would issue as a green leaf, if further germination were not arrested.

W. R. A., Williamantic, Conn., asks whether pearl millet will grow again if cut when about two feet high.

Ans.—Yes, but much depends upon the date of cutting and whether it is planted closely or otherwise. The season for this plant is very short in the above climate. It does not grow until settled warm weather and is checked by our first frosts.

W. B. McC., Corpus Christi, Texas, asks where he can find a market for dried rose leaves.

Ans.—There is a brisk demand for such goods in this city, but the price can be fixed only on inspection of sample. Apply to Hall & Ruckel, 218 Greenwich street, N. Y.

C. L. M., Fort Meade, Florida, asks where he can procure willow cuttings for basket-making.

Ans.—Of Parsons & Sons Company, Flushing N. Y.

NOTES FROM NORTH CAROLINA.

For several days the weather has been quite cold and much anxiety has been felt about the fruit. In some parts of the State the frost has been very destructive to the early vegetables, as well as the fruits. In this section we have, still, very good evidence that the gardens and orchards will not disappoint us. The strong winds of the coldest nights, and the extreme dryness that prevailed, prevented the injuries which the thermometer indicated. It has now turned warmer, and our hopes are much encouraged. I do not remember to have seen heretofore such striking proof of the statement that the frost is not likely to destroy the buds when the air is dry. There is also reason to believe that the northeast wind is more destructive than the northwest. Perhaps it is because the former is more freighted with moisture.

Our people find themselves under the misfortune of a scarcity of corn. The price at this place is about 80 cents per bushel, and the poor have had to pay at the rate of $1 per bushel for meal. The causes are found in the shortness of the last crop and in the vast consumption of grain by liquor-distilleries. Different parts of our State are infested with reckless characters, known as blockade-distillers. Many if not all of them are men of desperate characters, who seem to be determined to carry on their illicit work at every hazard, no matter what the penalty. As long as they can evade those who are faithful officers of the government, they find money in the business; and they, of course, do not care how much their victims suffer, or to what extent all classes are made to feel the effects of such wholesale destruction of bread. It is certainly a crying evil. There is, apparently, an alarming increase in the intemperate use of intoxicating liquors by our people—perhaps I may say, especially by the laboring classes. I saw, the other day, a young farmer reeling with drunkenness, in his little wagon, as he was carrying home a load of commercial fertilizers. What hope is there that he will succeed on his farm this year? Twice recently I have seen a long train of wagons, loaded with fertilizers, passing through our village. It made me sad when I considered how poorly such farming as ours can afford so great an expenditure for such a purpose.

The months of February and March have been very favorable for early plowing. Repeatedly the ground has been exceedingly dry. April is proving true, and it is now raining. This spring is much more backward than the last. My rye is not quite ready for the sickle, whereas, last year, I began to mow it on the 9th of March.

Our farmer-legislature reduced the office of State Geologist to a sort of appendage to the Agricultural Department. The Commissioner of Agriculture was subjected to a severe investigation; and, though the Department was continued, it is embarrassed with the prospect of smaller receipts and new expenses. The Fertilizer Control Station, etc., is continued at the University. Dr. Ledoux, the chemist, is winning an enviable reputation and challenging the confidence and gratitude of all our people. As I prophesied, the legislators were afraid to do their duty by providing for the protection of sheep against dogs. The Legislature's friends (I mean the dogs) appear to be encouraged by the favor shown them by their high protectors, as I hear of murderous raids on the small flocks in this county. M.

Chapel Hill, April 7, 1879.

NORTHWESTERN ILLINOIS.

The first attempt at seeding here this spring was made on the 11th, 12th and 13th of March, when some wheat was sown; but the weather turning cold, and the ground freezing solid, nothing more could be done until about April 1st, when seeding was again resumed. Then three or for inches of snow fell on the 2d, and work was again suspended until the 7th and 8th, when some more wheat was sown; a copious rain on the 9th and 10th inst. completely saturated the ground and stopped work for a while; but now the soil is in good condition and seeding is progressing rapidly. Some have finished sowing wheat; very little oats or barley have yet been sown, but if the weather continues favorable for a week, most of the seeding of the small grain crops will have been finished.

The acreage of spring wheat will be somewhat diminished here this season, as the crop has not proved profitable the past few years, having been damaged by chinch bugs, rust, etc. I think, too, there will be somewhat less barley and oats sown than usual, as the season is now late and the farmers do not feel like risking much in late-sown spring crops. There will be a corresponding increase in meadows and pasture lands, and about the usual acreage of corn, potatoes, etc. The success attending the sowing of salt on wheat land, in the vicinity of Rochelle, Illinois, last season, has encouraged others in that locality to try the experiment this spring, as I am informed that a number of the farmers there are sowing salt on their land—about one barrel of salt to one and a half acre. It is claimed that the salt has a beneficial effect in stiffening the straw and preventing damages from chinch bugs and rust. After harvest I shall let you know the result. Winter wheat and rye have a promising appearance in this section. The large amount of snow the past winter, and the uniformity of the weather (there being but few sudden changes of alternate thawing and freezing), favored the winter grain very much. The acreage, however, of winter wheat in northern Illinois is not large. The number of acres in cultivation in 1878, of the different crops, in Ogle County, according to the estimate of the State Board of Agriculture, was as follows: corn, 134,868; winter wheat, 4,299; spring wheat, 40,427; oats, 63,377; meadow, 44,718; pasture, 18,977; orchard, 966. Acreage of other field crops (in 1877), 6,676; woodland, 16,129; improved lands, 415,839. Those last three items are from the Assessors' returns for 1877.

The total number of acres in cultivation in 1878, in the State, was as follows: corn, 8,672,088; winter wheat, 2,032,843; spring wheat, 291,912; oats, 1,560,120; meadow, 2,368,845; pasture, 3,983,459; orchard, 412,140. Acreage of other field crops (in 1877), 711,228; woodland, 5,607,990; improved lands, 25,338,072. The last three items are from the Assessors' returns for 1877.

These figures convey an idea of the extent of Illinois crops, but the immense live-stock and dairy interests should not be overlooked, and should be seen to be appreciated. We still hear the chronic complaint of hard times; but how thankful all should be that the "hard times" (?) are not caused through a famine.

Baileyville, Ogle Co., Ills., April 12. W. B. D.

RURAL SPECIAL REPORTS.

New York, Croton, Del. Co., April 12.—The winter just passed has been an uncommonly severe one in this locality, and as a consequence of this, or from some other cause, there has been an unusual amount of sickness. We had about three months continuous sleighing, from about Christmas till the latter part of March, and even yet there is a heavy body of snow on the hills about us. Very little maple sugar has been made as yet, and there is nothing to indicate a very rapid approach of "ethereal mildness." Farmers are badly discouraged at the butter prospect for the coming year.

E. J.

Michigan, Joyfield, Benzie Co., April 11.—Winter wheat looks well; farmers are preparing for sowing spring wheat and oats. Wheat is worth 75c. to $1; oats, 35c. to 40c.; corn, 40c. to 45c.; pork, 6c. per pound; land from $2 to $50 per acre. Quite a large number of newcomers arrived here last fall, but there is plenty of room for more. G. D.

Ohio, Bennington, Morrow Co., April 12.—Early sown wheat looks well; late sown, however, looks badly. Peach trees and raspberry canes are greatly injured by the cold winter. Many sheep look thin and sickly; other kinds of stock have wintered well. Apples are killed. Wheat, 95c.; corn, 32c.; oats, 22c.; butter, 12c.; eggs, 9c., and yet we are hopeful. J. L.

Musical Instruments,

ORGAN BEATTY PIANO

BEST IN USE — BEST IN USE

A $375 13-Stop Parlor Organ for only $97.00

ONLY $97.00

The price of this beautiful Grand Parlor Organ is $375 or, in other words, this is about the price asked for such an instrument by the **Monopolists** Agents I have been offering at wholesale at **$105**, as my very lowest net cash price. I am determined that all shall see my celebrated instruments and judge for themselves, and therefore I offer this beautiful, neat design, to the readers of this paper, **FOR ONLY $97.** Order the instrument, and **pay only after you have tested it at your own home.** Don't want the money until you are entirely satisfied. This is a very fair offer for you. ☞ Description of this magnificent instrument is as follows: **Beatty Organs, Style No. 2100.** A beautiful Celtic style of architecture in this case strikes the eye of the connoisseur and stamps it at once as the most beautiful case extant. Dimensions: Height, 74 ins; Width, 48 ins.; Depth, 24 in.; Weight, when boxed, over 350 pounds. **Three (3) Sets of Reeds. Five (5) Octaves. Thirteen (13) Stops.** (1) **Grand Organ**; (2) Principal Forte; (3) Dulcet; (4) Diapason; (5) Hautboy; (6) Principal; (7) Vox Humana; (8) Flute; (9) Violina; (10) Dulciana (11) Echo, (12) **Vox Celeste**; (13) Clarionet. Beatty's Celebrated **Grand Organ** Knee Swell, and Beatty's New and Improved Double acting Knee Swell. The case of this instrument is solid Walnut, full French Veneer, and finished in the **highest style of art.** The musical combination excelled by none. All things considered, it is the most desirable style that can be selected. I challenge its equal. ☞ Regular Retail price asked for such an instrument by the Monopolists' Agents, about.....$375-00

I will sell this beautiful Organ to the readers of this paper, in order to have it introduced, boxed and delivered on cars, **FOR ONLY $97.00**

Please send your order by letter or telegraph. **No money required until you are entirely satisfied.** Pay for the instrument only after you have tested it at your own home. If it is not as represented, return at my expense, I paying freight, charges both ways. This certainly is a fair offer. I positively will not deviate from this price ☞ **Fully warranted for 6 years.** I want this instrument introduced hence this unparalleled offer. Remember, I have no agent, but sell direct, hence this remarkably low price. **You can order direct from this Advertisement, which will not appear again.** Nothing can be saved on this instrument by correspondence. **Order at once.** If you do not want one yourself, order one and make your friend a handsome present. Every Beatty Organ when introduced into a new locality, sells others, **as it is a standing advertisement.** Please remember, the above unparalleled offer is good for a *limited period only*, and is made solely with a view of introducing this superb instrument. Trusting that by offering it at this very low price, I shall induce very many to buy this beautiful new style, thereby building up a demand that will eventually repay me for this sacrifice. **New Rosewood Pianos, $125, $135, $145 and upward.** Large Illustrated Newspaper, about cost of Pianos and Organs, sent free, post-paid.

Address, **DANIEL F. BEATTY, Washington, New Jersey, U. S. America.**

☞ PLEASE SHOW THIS SPLENDID OFFER TO YOUR NEIGHBOR. ☜

BEATTY

—The most successful business man in the world. BEATTY'S Celebrated PIANOS and ORGANS are acknowledged to be the best and most perfect instruments on the globe. More Beatty's celebrated Pianos and Cabinet Organs have been sold during the last four months than nearly all the other manufacturers combined. No wonder they are jealous of his great success. While other manufacturers are crying hard times, Beatty can hardly fill his orders, so great is the demand for his celebrated Pianos and Cabinet Organs. Mr. Beatty commenced business only eight years ago without a dollar, a poor and unknown plow-boy. He is to-day the most successful man in his line in the world, doing a business of several millions annually. This is the result of that attention to business, liberal, judicious advertising, plenty of pluck, and, above all, strictly first-class Pianos and Cabinet Organs, selling them at the very lowest net cash wholesale prices to the public direct, avoiding all middlemen, agents, etc. Read his unparalleled offers for a limited period.—*Extract from the Star.*

☞ P. H. Hann, Cashier First National Bank, Washington, N. J., (Piano); J. L. Everitt, Cashier National Broadway Bank, New York City, (Organ); Wm. Underdown, Cashier Mechanics National Bank, Phila., (Organ); Rev. Josiah Swett, D. D., Highgate, Vt., (Piano); Rev. J. B. Good, D. D., St. Joseph, Mo., (Piano); A. J. Lowery, of Wells, Fargo & Co's. Express, Placerville, Cal., (Organ); and thousands of others throughout this country and Europe, are now using in their families Beatty's Celebrated Pianos and Cabinet Organs. ☞ Send at once for long list of testimonials from persons, some of whom you may know.

CLUBS—Where two or more Pianos or Organs are ordered at one time, I will make a discount of 5 per cent. from this unparalleled offer.

In no case will I make a discount from these offers on a single instrument. Those who desire and will forward the cash with the order, will receive with the instrument free of charge a fine Stool and Beatty latest instruction book. I will not give away a Stool and Book when parties pay only after testing the instrument at their own houses. Please do not ask it.

$1,000 3-String Grand Square Piano for Only $255.00.

$1,000 PIANO FOR ONLY $255.

$1,000 PIANO FOR ONLY $255.

BEATTY PIANO *SQUARE GRAND, Style No. 2023.* Magnificent Rosewood Case. Elegantly finished. **Three Strings.** Weight when boxed, over 1000 lbs. Seven and one-third octaves. Full agraffe scale. Rosewood case, all round corners, beautiful carved legs and lyre, heavy serpentine and top mouldings all around the case, back finished same as front. New serpentine, with Beatty's very latest full iron frames, bars and extra braces, improved new scale, overstrung base, French grand action, fret desk, carved pedal, solid rosewood mouldings, ivory key fronts, capped hammers, agraffe treble, and every improvement which can in any way tend to the perfection of the instrument has been added. This instrument is a magnificent Pianoforte. ☞ This offer may appear fabulous, but I mean every word of it. It is a special offer, more liberal than any other manufacturer can safely make on an instrument containing the same superior qualities, and were it not that I do business on a strictly cash basis, I would not be justified in making it. In presenting this instrument to the world at this very low price, I do so with an eye to the future, knowing that its introduction into any locality will result in making many sales. Its style must be admired and its intrinsic qualities highly endorsed. Fully warranted for six years. Sent on half month test trial. No money required until the Piano is fully tested at your own home. I want this beautiful Piano more generally introduced, hence this unparalleled offer. Order at once, as every Piano when introduced in a new locality sells others. We all know a good article is a standing advertisement. Regular retail price asked for such an instrument by the monopolists' agents, about $1,000. ☞ I will sell this magnificent Piano, boxed and delivered on board cars, to the readers of this paper, in order to have it more generally introduced, for only $255. You may forward your order by letter or telegraph and the instrument will be shipped at once. No money required until the Piano is fully tested at your own home. If in any way unsatisfactory you are under no obligation whatever to keep it, as I will cheerfully take it back and pay freight charges both ways. ☞ New Parlor Organs $65 $75, $85, to $440. Latest Illustrated Newspaper, with much information about cost of Pianos and Organs sent free.

Address, **DANIEL F. BEATTY, Washington, New Jersey, U. S. America.**

Wisconsin, Fort Howard, Brown Co.—In the Rural for Dec. 14, I claimed that a wet soil for an orchard was a preventive against root-killing on the ground that water could never get below 32° Fah. any more than it could rise to a greater temperature than 212°. The Rural objected to this statement, still it is a fact that trees hereabouts whose "feet" were wet stood the severe winter weather better than those on a dry soil. I don't want my trees in a sour soil, but I do want their feet to be wet when they freeze. Van.

[Water confined in a vessel in which expansion is impossible, and under several other conditions also, can be reduced to a temperature much below freezing point, without being frozen. The temperature of ice, too, is frequently many degrees below 32° Fah. on our cold winter days, and many degrees below zero in the long nights of arctic regions, and can be artificially reduced to a temperature so low as to produce a sensation of severe burning in the hand on touching it. Although under ordinary atmospheric pressure at the sea level, water is converted into steam at 212° Fah., still if the pressure is increased, as at the bottom of a deep mine, or by artificial means, it requires a proportionately higher temperature to vaporize the water.—Eds.]

Conn., Poquonock Bridge, April 12.—Farming here is hardly thought of yet. Occasionally a solitary old man may be seen trundling his little wheelbarrow about, and loading it with small stones after rapping them out of the frozen earth with the toe of his boot. Instead of taking the stones to the beach close by, where they would be out of the way of the team in plowing, he deposits them in small heaps a few rods apart all around the lot.

M W.

Vermont, Waterbury, April 10.—Sugar-making in this State is very late. Many sugar-maple orchards were not tapped until the present week, and very little sugar has been made hitherto. Potatoes are worth 65c. per bushel; corn, 50c.; oats, 25c.; eggs, 1c. each.

A. A. L.

Vermont, Brandon, Rutland Co., April 11.—Our mountains are still snow-clad and our valleys about half-covered with their winter mantle. Hitherto the ground has been frozen too hard to permit of the planting of peas even, unless a hole for them is prepared with an axe.

N. B.

Kansas, Sedgewick, Harvy Co., April 7.—Farmers hereabouts have finished sowing oats; some are planting corn, others plowing for it. Early wheat looks well; late-sown is all dead. Weather very dry. A. H. G.

(See page 291 for continuation of Everywhere.)

CASH vs. CREDIT.

"Pay as you go" is an old saw but a wise one. It is the cheapest way and the safest. To run in debt is an American habit and there is no other nation in the world where credits are so popular as with us. We borrow with the greatest facility. The thought of pay-day rarely troubles the intending borrower; and the borrower and the debtor through purchase stand precisely in the same position; they are both borrowers in fact. It is only rarely that we come across a man who has the reputation of being a "solid" man, without any bubbles of credits in his business, and buying only for cash. The practice is so general that business is built up on that basis; sales are made in anticipation of a year's credit or even more, and public sales are never, or hardly ever, announced unless with the heading "CREDIT SALE" preceding them. At a cash sale one gives the actual value of what he buys and many who are tempted to buy at credit sales, will avoid a cash sale from habit if not from necessity.

The difference in the cost price of articles so purchased is an *enormous* tax on industry, self-imposed, it is true, but none the less onerous for that. This is poor management. "The destruction of the poor is their poverty." If we consider this ancient, but true proverb, in its narrowest sense, we shall miss its most valuable lesson. There are poor men financially considered; but for one of these who becomes so by unavoidable necessity, there are a hundred who make themselves poor. There are poor managers of their affairs; poor business men; poor farmers; poor readers; poor thinkers, and those with poor memories upon which the results of mistakes sit but lightly or rest not at all; and these are each and all worse off than the man who is poor as regards money alone. A man with brains and the capacity to use them; who can foresee chances of profit and who can seize them as they come; who is shrewd, prompt in action and enterprising, is a rich man as compared with one who possesses none of these advantages, but who has only money at command. There are rich poor men, and poor rich men; and these soon change places. "I have entered into a patnership" said one, "my partner finds the money and I find the experience." After a time this one said "I have dissolved partnership; I have now the money, and my partner has the experience." It will always be thus: the poverty of the man who is poor in business ways, destroys him.

There are some maxims in business which a man, and especially a farmer who is generally defective in this respect, should write on the first page of his memorandum-book or diary, and read over every day. Some of these are: "Owe no small debts." "*It is better to borrow money on a note, or a mortage and pay a moderate interest on it, than to have a number of small debts out.*" "BUY FOR CASH." "SELL FOR CASH." "*Do not buy a thing that you do not want.*" "*Do not want a thing because it is cheap.*" "AVOID AUCTION SALES." "*Never endorse a note.*" "If you wish to oblige a friend and have the money, loan it to him; but put your name on no man's paper." "An endorsed note comes due always at an inconvenient time." "Never count your money until it is in your pocket." Many others might be added: but here are enough. If you want good authority for these, we may refer you to Solomon first, in whose ancient writings all these, and many more of similar import, may be found. Since his day these maxims have been iterated and reiterated until they are trite enough, but yet the great majority of men ignore them.

A man becomes prosperous by attention to small details. "Small leaks sink a ship." A habit of looking after small matters causes a man to carefully regard larger affairs; while on the contrary, looseness in the former respect, produces carelessness in regard to the latter. A business man who regards economy and safety, will never fail or become embarrassed; and there is nothing else in the way of business that is so economical or safe as dealing for cash. There may be men who consider that a debt, is a debt; that there are no degrees or differences in this respect. But there are debts and debts; and some are excessively more costly and burdensome than others.

We consider this subject of so much importance, that we think it a duty to devote some effort to put it in the clearest light before our readers, so that they may see it to their interest to go hereafter on a cash basis in their dealings. We expect to use figures to elucidate the subject, and having devoted here as much space as can be afforded to introduce it, we leave it for the present for our readers' consideration.

PROFIT OF CORN-GROWING, EAST AND WEST.

OUR Eastern agricultural papers and their correspondents, and the talkers at agricultural meetings, are very fond of arguing from statistics—which show larger average yields in the East than in the West—that Eastern farmers can grow corn as cheaply as their Western brethern. There is no bottom to such statements so long as corn can be grown in the West without manure or fertilizers. Neither, when it comes to manuring, can our hill farmers ever grow corn as cheaply as it can be grown upon prairie and plain lands. But there is no doubt that, by the adoption of Western methods of tillage, a great reduction can be made in the cost of our corn crops. The gang plows, the planters, smoothing harrows and two-horse cultivators used at the West, can as well be used on all moderately level Eastern lands, and thus one man can tend about as many acres of corn in one section as in the other.

There are already many instances where crops of corn have in this way been made at very low cost even in New England. And time, which "sets all things even," is working for this kind of equalization with the lapse of each succeeding year. The fertility of Western corn lands is declining; the increase in cattle both for beef and for the dairy in that section, the demands of a rapidly-growing city and village population there, the uses of grain for sugar-making, distillation and other manufactures, all point to higher prices for Western produce; while the adoption of Western methods of culture, the improvement of seed, and greater skill in fertilization of the soil and the handling of large crops, all tend to cheapen Eastern corn to the growers. Therefore we may look for a continous increase of the corn crop on all suitable Eastern lands, and a consequent decrease in the demand for Western corn on our farms, if not in our towns and cities. This is well for both sections; for the West ought to make its corn into meat and other compacter forms before shipping it. That is the way to prevent further decline in the fertility of Western farms, and to give more profit to Western farmers.

THE FARMER'S ROAD TO SUCCESS.

"You must be sure of two things," said Caleb Garth to Fred. Vincy. "You must love your work and not be always looking over the edge of it, wanting your play to begin. And the other is you must not be ashamed of your work, and think it would be more honorable to you to be doing something else. You must have a pride in your own work and in learning to do it well, and not be always saying, 'There's this and there's that—if I had this or that to do, I might make something of it.' No matter what a man is, I wouldn't give two-pence for him," here Caleb's mouth looked bitter and he snapped his fingers, "whether he was the Prime Minister or the rick-thatcher, if he didn't do well what he undertook to do."

We have often wished we could impress these ideas upon the minds of every young man in the country, and especially of young farmers and farmers' boys. Every one who will bring his life in accordance with them, will most assuredly win success. "You must love your work." This you can easily learn to do if you will give your thoughts proper direction. There is not in the whole list of industries one that has so much of real interest as farming. It embraces the whole list of sciences—chemistry, geology, physiology, animal and vegetable; minerology, botany, entomology—there is not one that does not belong directly to the farmer and upon which he cannot, if he chooses, draw at will. In what is more pleasure than in gaining information? To the farmer the whole exhaustless book of Nature is open, for him to read as he labors. Every hour of every day turns a new and interesting page. If he will but read it, he cannot fail to love his work.

"You must not be ashamed of your work." Why should you? It shows a weakness one should blush to own, when the very best men of our own and all other times have united in its praises. "The most healthful, most useful and most noble employment of man" deserves better than that any one should be ashamed of it.

"You must have a pride in your own work, and in learning to do it well." It is just this that makes all the difference between success and failure. The farmer who works constantly under compulsion and goes to his labor with the feeling of a slave, without ambition, without enterprise, *is* a slave, and will always remain so, and his wife and children are with him in servitude bound down by the bonds his want of pride in his work impose upon him. But let such a man determine he will raise a better crop than his neighbor, and his ambition is at once aroused, his energy is excited, his success nearly assured, and a pride awakened which is the promise of better work in future. And it is better work in all departments of agriculture that is needed—better soil, better seed, better culture.

To do well what one undertakes to do is a duty. No matter what the task may be—plowing a furrow, planting a seed, building a bridge, painting a picture, writing a sermon, teaching a child, anything from smallest to greatest, he who fails to do it as well as he can, is guilty of fraud. No man worketh for himself alone. The laborer is certainly worthy of his hire, but the world has a right to demand that the products of his labor shall be as good and as great as he can make them. The man who, being able to work, remains idle, defrauds the community by just so much as he, by his productive labor, could contribute to its wealth, and he who produces less than he might, owes a debt to society he can never repay.

The path of duty, then, for the young farmer is a plain one. He must love his work and not be ashamed of it; he must take pride in what he does and he must do well what he undertakes to do. Besides, the path is not only a plain, but it is a pleasant one. An occasional Thistle may obstruct the way, but it will be easily removed, while Roses blossom on either side and the end is success.

THE TULIP TREE.

IT has occurred to a writer in the London Gardeners' Chronicle that our Tulip Tree (Liriodendron tulipifera) would form a valuable tree for town planting, "as it is a robust grower, and I should think from the smoothness of its bark and polished foliage, it would stand smoke, smut and dust almost as well as the Plane and Poplars." "What grand objects they would be," he says, "along the Thames embankment, and along our public parks and squares!" This Tulip Tree is one of the noblest trees in cultivation, and it shows how little our people study such matters that it is so seldom seen in *our* parks and squares." The same writer says: "It is in the autumn, however, that these trees are the most striking, their leaf coloration being then grand in the extreme, and I have regretted that I could not preserve the leaves with all the rich and beautiful tints they then assume." Do the leaves of the Tulip Tree assume such beautiful fall tints as this writer describes? All that we have ever seen turn yellow, the ordinary color of dead leaves. Or do the leaves assume richer colorings in England than here?

Economy.—This will apply to labor of all kinds. It is economy to have every thing ready before beginning work. It is economy to have good tools, a good start, a fast-walking team and a good hired man. It is economy to feed the teams well and take care of them. It is economy in order to raise good crops to sow good seed of the best varieties. It is economy to ditch or tile-drain heavy land and all land which is springy, if it is to be sown with crops. In other respects many farmers could with profit practice more economy. They should save more, and waste less. They should shelter tools and keep them in good repair. They should secure crops in season. They should continue to use up all materials to the best advantage. Manufacturers understand this and learn to save the refuse materials and waste nothing.

A Wild Garden.—At this season of the year, again the early spring flowers and ferns are putting forth their tender growth. Every lover of Nature admires these beauties of the vegetable kingdom. Select some nook in the garden or in the yard, and transfer some of these favorites where they may be often seen and studied. Remember to study the nature of the plants which are removed. If they like shade, or sun, muck, wet or dry soil, give them their choice of these. With a very little encouragement and an opportunity, the children will delight to do this part of the work. It will keep them busy, teach them to love Nature and their rural homes. Give our wild plants a chance.

BREVITIES.

HINT FOR THE SEASON.—"Now or never."

UP with the Lark and to bed with the Robin!

GOOD reports regarding hardiness of the Snyder Blackberry reach us from the West.

MR. J. J. THOMAS finds only a slight difference between the Peaches "Amsden" and "Alexander." Mr. Geo. Husmann, of Missouri, prefers "Amsden."

PROF. BEAL states in the Fruit Recorder, and Mr. Thomas, of the Country Gentleman, inclines to the same view, that scraping the stems of Apple trees is worse than useless.

THE Large-leaved Hemlock is one of the most desirable of dwarf evergreens. While the species has been seriously injured by the past winter, the above variety (macrophylla) has not been harmed in the least.

ONE of the hardest things for horticulturists to do is to displace the Concord Grape and the Wilson Strawberry. They have an immense "constituency" all over the country, and their friends stick to them like leeches.

DO not forget to sprinkle the nests of sitting hens with sulphur. When they come off their nests for their daily bit of recreation, have ready for them all that they *need*, so that they may return to their work contentedly.

TWO of the mistakes made in our seed distribution were these: A subscriber applied for ten varieties of seeds and specified that he did not *want* any potato. He received ten potatoes and *no* seeds. Another subscriber who wanted all potatoes received the ten varieties of seeds.

WE asked Mr. S. B. Parsons, who has devoted years to the study of the Queen of Flowers, what Hybrid Perpetual Roses he would choose could he have but two? His answer shows that he is not carried away with the late "improvements" of that flower, viz., Gen. Jaqueminot and Madame Plantier.

MUCH was said last year about the advantages to be derived from harrowing wheat in the spring. But many trials seem to show that it is not specially helpful.

> "Oh! friendly to the best pursuits of man;
> Friendly to thought, to virtue and to peace,
> Domestic life in rural pleasure passed."

A CAREFUL look over our Raspberry plantation shows us; first, that it has not been so much injured as we had supposed; second, that several varieties which are believed to be among the *hardiest* have been injured more than some other varieties which are generally believed to be among the *less* hardy sorts. The best definition of a hardy Raspberry is "that from which in the long run we can pick the most berries."

MR. E. E. BARNEY, who is at so much pains to enlighten the public respecting the durability &c. of the Catalpa, and especially of the variety *Speciosa*, quotes from the RURAL NEW-YORKER of fifteen years ago: "The Catalpa is the most durable wood known, excelling Black Locust, Red Cedar, and Mulberry in that it has no sap wood, so that trees of three or four years' growth would not rot when set in the ground for fence-stakes, hop or bean-poles."

WEAKER THAN A WOMAN has won golden opinions from our subscribers. For several months we have been in daily receipt of letters praising it in unstinted terms, which has been very gratifying, as we are at great pains and no little expense to secure stories which, in our opinion, deserve a place in our columns. It is extremely difficult to find a story that is dramatic, intense and at the same time pure in tone. The average author is seemingly impressed with the idea that, to make his tale piquant, he must either introduce impossible adventures and caricatures of ordinary humanity, or (what is still more to be condemned) the morality (?) that disfigures most French novels. Our present serial will be completed in the course of six or seven numbers, when we will begin another which we have no doubt will rival in popularity the old favorite, Weaker than a Woman.

WE CALL the attention of *every* reader to the remarks on this page under "Cash against Credit." Read it every one, trite as the subject may appear. *Credit* is becoming the *bane of farmers* to a degree that few who ask and accept it realize. The borrowed dollar of to-day is looked upon as if it were in part a gift, and the fact that to-morrow we may have two dollars to pay for the use of it, is not considered. We propose so to present this subject in a series of articles, as to oblige farmers to *feel* its vital importance. We therefore urge our request that both old and young—but more especially the latter—will read what we have to say patiently and thoughtfully even though, at the outset, they may deem that we can offer them no instruction upon a subject which from early times has been uphorized to death. That millions of dollars are squandered yearly in the purchase of agricultural implements alone, that, if these were bought for cash, might have been saved to the farmer and his family, is stirring proof that the lessons of these aphorisms, like the most self-evident laws of health, are by many disregarded the same as if they had never been written. Agricultural implements are necessities to modern agriculture. No other journal has more persistently set this forth than the RURAL NEW-YORKER. But in the business of farming there is no margin of profit which allows the farmer to pay double the value of an implement for the privilege of using it a year before it must be paid for. A mortgaged home with us stands foremost among the dreaded things of life. But it is the part of wisdom rather to pay seven per cent. on a mortgage-debt than twenty-five per cent. for the privilege of not paying for goods when purchased.

Literary Miscellany.

CRUMBS.

BY MRS. BETTIE KEYS CHAMBERS.

THE lesson which once has been learned,
Is never so hard to repeat;
And the lane which once has been turned,
Is never so rough to the feet.

Tho' over and over again
We're learning the lesson of life,
There's something we long for in vain,
'Mid folly, and tumult and strife!

But why are we never content
If Faith in our bosoms we keep?
Tho' false with the true may be blent—
'Tis better to smile than to weep.

Each day we may gather some bliss,
Which close to our hearts we may bind;
To make us courageous in this,
While waiting the next life to find.

Each day has its shadow and shine,
Tho' mingled with tempest and rain;
Each evening must surely decline;
The night with its rest come again.

Each footstep we make in the snow,
Is weary and chilling, my dear:
But nearer the valley below,
Is smiling our spirits to cheer.

And under the snow, 'neath our feet,
May, dormant, lie some little seed,
To spring up all lovely and sweet
Because of our step it had need.

There's many a gladness we lose,
Which love to our clasping has led,
Because we reach farther and choose
To grasp at a shadow instead.

Then do not be gloomy, nor sad,
Whatever our lives have in store—
We cannot unmix good and bad
Till landed upon the bright shore.

I know there are times when the heart
Is yearning for something above,
All joy which on earth hath a part,
All peace which is gathered from love.

I know 'tis but symbol and sign
Of what we shall hereafter be—
My spirit but asks the Divine
One boon—to be folded with thee.

Then do not be gloomy, or sad,
But let us walk steadily, friend,
And look up—our bosoms made glad
With cheerfulness unto the end.

[*For the Picayune.*

AN UGLY GIRL.

(Continued from page 254.)

CHAPTER VI.

MISS CARISFORDE'S DUENNA.

AN elegantly-served dinner was set before Noel, and the servants in attendance treated him with as much respect as if he had been really their lord and master; but he had no appetite, and the civilities of his attendants were so irksome to him, that as soon as he had ascertained Mrs. Estcourt was sleeping comfortably, he asked to be shown to the chamber he was to occupy. On the following morning in a more equable frame of mind, he was met in the breakfast-room by a comely, elderly matron. She was in deep mourning, like the rest of the household, but a penchant for bugles had led her to introduce them into her costume so profusely, that from head to foot she glittered at every movement. This lady bustled forward to meet the guest, and volubly introduced herself as Mrs. Hurst.

"H-u-r-s-t," she spelled, tapping her palm with her forefinger the while. "I like to be exact on these points: we are not exact in this world, are we? Mrs. Hurst, relict of a very worthy man, and the lady under whose care Miss Carisforde was placed some years since. My dear niece Hillian has described your lordship to me, so we will waive all formality, and proceed to breakfast. You'll not object, perhaps, to communicating with me by signs? It commenced with the mumps, and ended in deafness—temporary, of course, but extremely inconvenient, just now, too, when I might have been of so much service to the poor child. You take sugar?"

Noel moved to the seat to which Mrs. Hurst pointed, and then glanced at the door by which he hoped to see Hillian Gray enter; but she did not appear, nor, although he exerted all his ingenuity, could he make the lady understand his inquiries for her niece. When he asked if Miss Gray would not join them, she smiled blandly, and begged him not to make any further apologies, for it wasn't of the least consequence; she had not minded the delay at all; it had given her time to decide whether she ought to put him on the right hand or the left, whether he would prefer the window to the fire, or *vice versa*. In fact, now she came to think of it, she had only waited three minutes and a half precisely.

"And if it had been twice as long," she added, as she poured out the coffee, "the pleasure of your society would have compensated for it. We have been so low ever since the event—so frightfully low and depressed. It ought not to have happened, you know, at only fifty-nine and the Carisfordes such a long-lived family. You look very healthy yourself, my lord; an excellent constitution, I should say, judging by appearances, which are not always deceitful. Yes, so very low, that it's really delightful to be able to to enjoy a little cheerful conversation once more."

The good lady appearing quite unconscious that she was indulging in a monologue, Noel could only nod and smile, and submit to be reduced to absolute silence by his inability to make himself heard.

"I shall visit your good mamma," Mrs. Hurst told him presently, "as soon as Hillian can go with me to interpret. It is not every one I can understand as quickly as I do you; but then your eyes and gestures are very expressive. Yes, I shall take Hillian with me; but with one of her frightful headaches—which is sure to end in cloths dipped in vinegar and a darkened room if she persists in exerting herself—how is it to be done? Unless Mrs. Estcourt is equal to a slate, then, indeed, I could go to her directly. What do you say?"

Noel had to consider awhile before he comprehended that Mrs. Hurst proposed holding a conversation with his step-mother by the help of a slate and pencil, and could, by a grave shake of the head, put a negative on her proposal. Much as he regretted the indisposition of the good-natured little Hillian, he could not help feeling glad that Mrs. Estcourt would be left to herself till she had partially recovered from the shock of her disappointed hopes, and would be less likely to disgust all who heard her with the peevish virulence of her lamentations.

"Not equal to it? Poor soul!" cried Mrs. Hurst, sympathizingly. "Just my own case when I was robbed at the railway-station; three large trunks, beside bonnet-boxes, and all Hillian's wardrobe—it was a great responsibility, you know—and couldn't remember for the life of me whether my desk, with a fifty-pound note in it, was in the stolen trunk or one of the others. Whenever I spoke I screamed—not intentionally, of course; and I'm sure I felt as if I should have dropped when I saw the porters clap their hands over their ears. Very distressing, wasn't it? I wish you would try another egg, my lord—pray do!"

But Noel was not to be persuaded, and Mrs. Hurst, rising from her seat, came to his side, and laid the fat little forefinger, with which she always pointed her discourse, on his coat-sleeve.

"Then I'll tell you what we'll do. I will go to the housekeeper's room and superintend the making of some jelly for Mrs. Estcourt; highly restorative, and from my own recipe. I tried it first on a favorite dog, and the effect was wonderful! If the poor pet had not died suddenly in a fit—which will happen, you know, and no preventing those attacks—I'm sure I should have brought Fido—did I tell you that his name was Fido?—yes, I should have brought him round. And while I make the jelly, Mrs. Martin shall show you over the house. You'll find plenty to amuse you; and if Miss Carisforde really will not come down to dinner—which I think a mistake on her part, and I mean to tell her so—we will have a cosy evening *tete-a-tete*."

The smiling, talkative, self-satisfied but really warm-hearted old lady trotted away to fulfill her intentions, and Noel, learning that his stepmother was not ready to receive his proffered visit, gladly availed himself of the services of the prim housekeeper, who came at Mrs. Hurst's suggestion to escort him through the principal apartments of the mansion.

Mrs. Martin was not accustomed to play the cicerone, and filled the office so badly, that when she had led the way through half-a-dozen dreary though magnificent saloons, and opened the door of the library, Noel was glad to civilly give her her dismissal. She was not an old servant, and had none of those quaint legends stored in her memory that we generally hear from the custodians of our ancient halls and castles. The late lord's suite, which communicated with the library, was full of pictures and statues, she said, and his lordship was at liberty to go wherever he pleased, except into the tower. Miss Carisforde was occupying the principal rooms in that, and might not like to be disturbed.

Promising to respect the heiress's retirement, Noel wandered at his leisure from picture to statue, from statue to cabinet, sometimes admiring the rare works of art the Viscount had collected, but not unfrequently wondering at the taste that preferred whatever was antique to the equally beautiful productions of our own times; and when his head and eyes ached with gazing, he opened a glass door, and stepped out, to take from the gardens a survey of the exterior of the mansion.

Carisforde was an imposing structure. It had originally consisted of the tower already mentioned and a square block of buildings, to which in the Elizabethan age considerable additions had been made, irregular in their shape and very picturesque; but neglect had made sad havoc. The stonework must have been decaying for years, and nothing had been done to arrest it. Even to the unpractical eye of Noel several portions of the wall looked positively unsafe, and, if left in their present state much longer, would require taking down and rebuilding. It was grievous to see so fine a place in this condition; the grass-grown avenues, the wood-choked *parterres*, the moldering gateways, and crumbling doors and casement frames, giving it the air of having been untenanted for many years.

The deserted, uncared-for appearance of the house was so depressing, that ere long the young man was glad to return to the library, which Lord Carisforde's affection for his books had induced him to keep in something more like repair.

Here he found plenty to amuse and employ him till a message from Mrs. Estcourt summoned him to her presence. She was dressed, and sitting in an arm-chair by the window, yet in answer to his hope that she felt sufficiently recovered to return to town at once, fretfully protested that she felt worse than on the previous day.

"But I did not send for you to speak of myself," she added, beckoning him to draw nearer. "I have seen Miss Carisforde. Yes, she has been here, and I have pleaded your cause well and boldly."

"My cause!" cried Noel, knitting his brows. "Surely you have not led her to think that I complain of her father's will."

"I told her the plain truth: that it was her duty to give up the property to you; that she could not, in common justice, act in any other way. Is it your fault that some extravagant ancestor alienated it? Are you not the rightful heir? and have we not been scandalously deceived about it? Now don't look at me in that manner, Noel. Some one must fight your battles for you if you haven't spirit enough to do it yourself. You know very well that if you were left alone you are simpleton enough to go back to town as poor a man as you left it!"

"I wish to heavens I had not listened to the doctors; but put you into the fly and carried you away last evening," retorted the incensed Noel. "How could you make such a coarse—such an inexcusable attack on the feelings of this poor girl; or how could you imagine that, even if she were willing to relinquish her rights at your dictation, I should take advantage of her inexperience and generosity?"

"You talk romance, whilst I practise common sense," his step-mother replied. "If I contrive to make good terms for you, I suppose you will be grateful?"

"What do you mean by good terms?" asked Noel, scornfully. "Do you forget that guardians are named in the Viscount's will, who will take care that Miss Carisforde is neither teased nor persuaded into any follies? Did she not remind you of this?"

"She scarcely spoke; she only cried, and wished her papa had bequeathed this hateful money to anyone but her. Anyhow, Noel, I am sure I contrived to prepossess her in your favor. If you could but make up your mind to marry her! It seems madness to fling away such prospects."

"Does it?" said her stepson, dryly. "Do you think if my father had lived, he would have sanctioned an act so mean—so base as the wedding of this poor young creature solely for her money? Pray hear before you interrupt me, Mrs. Estcourt. It may save both of us some trouble if I make my intentions clear to you at once. Your interference is useless. I will do nothing of which my conscience disapproves. The few hundreds that Mr. Whitely tells me I can claim, I will immediately make over to you; with these you must be satisfied; for I have resolved to leave England."

"Of course, any addition to our income will be acceptable, although this is very little compared with what I expected from you," murmured Mrs. Estcourt, with her handkerchief to her eyes. "Irene is so careless with her clothes, and the boys are beginning to be frightfully expensive, that I'm afraid I cannot do much with a few hundreds, especially as one must live in something like style now you have succeeded to a title. How much per annum will it really be?"

She was beginning to find consolation in her prospects, as Noel had predicted that she would.

"I will tell you more particulars when I have seen Mr. Whitely again," he answered, briefly. "What time can you be ready to accompany me home?"

Mrs. Estcourt cast a rueful glance at the weather.

"Not to-night, Noel. It rains; the wind is rising, and I—I can't bear the jolting of a railway-carriage while my nerves are in this state."

"Then I must go without you. I cannot and will not remain in this house any longer. Miss Carisforde may think I am in league with you to annoy her."

"I never was spoken to in this manner, not even by your papa," whimpered Mrs. Estcourt. "It's downright unfeeling to propose dragging me away on such an evening. It would be the death of me, and then my poor children would be orphans."

"Pray say no more," interposed the vexed Noel, who saw that she was on the verge of hysterics. "I should be sorry to treat you with any lack of consideration. Only promise that you will not attempt to have any more interviews with Miss Carisforde, to whom I shall make your excuses and my own, and I will defer our departure until eleven o'clock to-morrow morning; but not a moment later. You will be ready?"

His step-mother sullenly assented, and Noel went away to pen a polite note to Miss Carisforde, merely thanking her for her hospitality, and stating that he and Mrs. Estcourt proposed leaving the Park by an early train on the following day, signing himself, with best wishes, her obliged kinsman, etc.

This done, he set himself to while away the remainder of the day as best he could. Mrs. Hurst did not return; doubtless she was in attendance on her niece, and he dined alone, returning as soon as the cloth was removed to the library. As the night closed in the wind rose to a hurricane, whirling and eddying around the old house till its roar was almost deafening. Once or twice Noel opened a shutter, and looked out; but the darkness was so intense that he could see nothing but the glimmer of a lamp in the windows of an apartment in the tower, to which the housekeeper had pointed as occupied by her young mistress.

Returning to his seat, he endeavored to forget the storm in the pages of a favorite author; but he was unable. The rattling of the casements and the moaning of the blast continually disturbed him, for mingling with these sounds he seemed to hear others; the sobs of a woman at no great distance, and the rolling of carriage wheels, as if, despite the lateness of the hour, visitors were arriving.

At last he could not refrain from opening the door of the library to ascertain whether a carriage had actually approached the house; but all was so still, that, half-ashamed of the tricks his imagination was playing him, he snatched up his book once more, determined to concentrate his attention upon it; but studying became impossible, when a conviction stole over him that he was not alone; that in a distant corner of the room, to which the lamp hanging above his head did not penetrate, a shadowy figure was standing—a female figure with glittering eyes that watched him with unwavering intensity.

CHAPTER VII.

THE STORM INCREASES.

Noel—Lord Carisforde—was as brave as most men, but to sit quietly reading while the wind was raging tempestuously around the house, and some voiceless shape hovered in the obscurity, was more than she could do. Starting from his seat, he crossed the room to where the figure stood; but it vanished as he approached—vanished so suddenly and utterly, that he was confounded, especially as he could find no door by which this person could have escaped him. Still he felt convinced that somewhere in this part of the library there must be another and carefully hidden mode of egress, for a current of air swept across his face as he drew near, such as would be created by the sudden closing of one.

Confounded by so strange a circumstance, he returned to his seat, but not to read. It was possible that Miss Carisforde had been seized with a curiosity to behold the man who had been selected by her most eccentric parent as her bridegroom, and had resorted to this manner of gratifying it: but if so, how odd—how peculiar. Neither was it pleasant to find himself the object of a scrutiny indulged in this manner; and so distasteful did the apartment become in which he was liable to be stolen upon at any moment, that Noel would have rung for a candle, and retired to his chamber, if the fury of the blast had not only rendered sleep an impossibility, but reminded him more forcibly than agreeably of the ruinous state of several parts of the mansion.

Presently a terrified maid-servant appeared to beg his lordship to go to Mrs. Estcourt, who had been so alarmed by some bricks falling down the chimney of the room she occupied, that she was screaming for him, and could not be persuaded that she was in no danger.

When Noel reached his step-mother's chamber, he found Mrs. Hurst with her, as well as the housekeeper; both were essaying to convince her that she was as safe in bed as she would be in the cellar, to which she was begging them to conduct her, but with no more success than usually attends efforts to reason with a most unreasonable woman.

"I'll not say that I think the tower quite safe," the housekeeper confided to Noel, "for there were some gentlemen here a little while ago—engineers and surveyors they were—who came to see my lord about a railway that is to cross a part of the property, and I heard them saying something about its insecure condition. I wish Miss Carisforde could have been persuaded to leave it till the gale is over. And she is quite alone, too."

"Have you told her your fears, and begged her to exchange her present quarters for safer ones?" asked Noel, a little startled by these tidings. "If not, pray go to her at once."

Mrs. Martin shrugged her shoulders and tossed her head, as she answered in acrimonious tones:

"I have told Mrs. Hurst, sir—my lord, I've made her understand; and indeed it's no light task to have to write down everything you want to say, but there's no help for it, as Miss Carisforde don't give any directions, or hold any communication with me, except through this person. It's not what I've been accustomed to, and I've always lived in the best of families, and know how things ought to be; and I certainly don't intend to stay here if I can't take my orders from my lady direct."

Leaving the housekeeper to ruminate over her offended dignity, Noel drew out his pocket-book, and wrote on a page of it the query:

"Should not Miss Carisforde be prevailed upon to quit the tower till the storm is over? I am informed that it is considered unsafe. Has she been made aware of this?"

Mrs. Hurst read these lines, and her comely face assumed an anxious expression as she laid he forefinger on Noel's arm.

"It is very thoughtful of you, my lord, and if persuasions would move her she would be here at this present moment; for, as I said when I was remonstrating with her, if we must perish through being buried alive under bricks and mortar, and nobody at hand to dig us out directly — which might be effectual—why not let us die together?—which is rather unusual when one comes to think of it, being buried first and dying afterwards; but in this life we are always meeting with curious contrasts, or undergoing something, aren't we? And she is that obstinate this evening, you cannot think! Nothing to be got from her but a kiss, and 'Do leave me to myself!' and no sooner outside the door than the key turned, and so how can I get at her?"

"Does she understand her danger?" wrote Noel again.

"My dear sir, I've shouted it—literally shouted it to her through the keyhole. What more can I do? She sent me away, insisted on my going; and though she is a dear child, and I am very fond of her, and haven't a word to say that isn't in her praise—mentally, of course—for she has been a most promising pupil, and for her external appearance I cannot be considered answerable beyond sunburn, and the care of her teeth in childhood, can I? Let's see, where was I? Oh! speaking in her praise, which I can do conscientiously, but with the reservation of temper, which certainly does incline to firmness, and that is not always a valuable quality, as I remember telling her when she refused to touch food for two days because she had forgotten to give her canary some seed, and it was starved. She was quite ill in consequence, and would not be pitied, which was a great anxiety to me."

Overwhelmed by the flow of words which his question had brought upon him, Noel said no more.

If Miss Carisforde so positively refused to be advised, nothing could be done but hope that her retreat would escape any damage from the storm, and he returned to the task of pacifying his stepmother. She—though fortified with camphor, smelling salts, and weak brandy-and-water—still shrieked, hid her face in the bed-clothes, and moaned out thrilling predictions that she should never see her children again, every time the wind put forth its force and howled its loudest along the corridors.

Presently there was a lull, and everyone was thankful for it. Mrs. Estcourt's eyes insensibly closed; the tired housekeeper remembered that it was after midnight, and went away to send her maids to their needful rest. Mrs. Hurst disappeared also; and Noel, after slipping some of his ill-to-be spared silver into the hand of the woman

who was to remain in attendance on his step-mother was about to follow their example, when a tremendous crash resounded through the building, paralyzing with terror everyone who heard it.

What had happened? As soon as he could quiet Mrs. Estcourt, Noel hurried to ascertain, and was met by half a dozen scared servants, all asking the same question. No one could answer it—no one knew more than that the sound came from the direction of the tower, and that the roof of the billiard-room connecting it with the more modern part of the house had been destroyed by a mass of masonry that had fallen upon it.

Thither, followed by the boldest of the party, Lord Carisforde hastened, and found his progress impeded by such a heap of fallen stones, broken rafters, etc., that any attempt to gain the ordinary entrance to the tower must be very difficult if not impossible. As far as could be ascertained in the darkness of that awful night, one wall of the building had given way entirely, leaving the remainder of the building in such a perilous condition that it was doubtful whether the next blast of wind would not bring it down also.

And where was Miss Carisforde? No one knew; no one had seen or heard anything of her since she peremptorily dismissed Mrs. Hurst some hours previously. A servant, who from a safe distance reconnoitred the outside of the building, reported that a lamp was still burning in the upper story, which the young lady occupied. Yet the floor above this chamber appeared to be entirely destroyed; and she, if still there, might be lying dangerously hurt beneath the rubbish with which it must be partially, if not entirely covered. who would go to her aid?

The two or three men-servants shrank back aghast when Noel said that a search must be made immediately for Miss Carisforde, and one of them declared promptly that nothing could be done till daylight; that in the present condition of the tower, and with the wind still blowing at intervals so furiously that a strong man could scarcely stand against it, why, it would be madness to make any attempt to enter the tottering building.

In these opinions his companions coincided; but Noel was not so easily convinced. That it would be hazardous, and very hazardous, he admitted; but to permit hours to elapse, which might be hours of agony to this unfortunate girl, was not to be thought of.

"I shall not ask either of you to risk your lives," he told the men; "but I cannot permit such selfish considerations to influence me while a woman's life is at stake. I shall therefore make the attempt to enter the tower myself. There is a window on the north side which I could reach with a ladder. Get me up one as quickly as you can."

The men demurred. The r young mistress was a stranger to them, so that no affection for her spurred them to put aside their fears for their own safety, and risk their lives for her sake; while Noel stood before them, young, handsome, generous, and inspiring the feeling that it would be ten thousand pities to encourage him in so rash an enterprise. One of them, therefore, endeavored to dissuade him from attempting it, pointing out how unlikely it was that she still lived, and that even if he succeeded in finding her remains, it would be impossible to remove them till the morning.

"If I were sure that Miss Carisforde was no more, I would be guided more by your advice," was Noel's reply. "As it is, I must act, and promptly. Find me the ladder and a lantern; and if either of you have courage to go with me, well and good; if not, I will do my best unaided."

And neither of them proving willing to run into such great, and as they deemed it, unnecessary, peril it was alone that Noel Estcourt commenced his search for the heiress.—To be continued.

VARIETIES.

WHY SHE NEVER TOLD HER LOVE.

Could it be virgin bashfulness
That still concealed the tender thought?
Or fear she might perchance confess
A love that was not sought?

Was it mere woman's caprice?
Or pride, or maidenly reserve?
Was it respect for mental peace
Or merely want of nerve?

She could not choose but understand
He thought, his little game of sighs,
Slow parting pressure of the hand,
Soft words and "speaking eyes."

The reason why (this was above
Ten years ago) he now knows well:
She simply never told her love,
Because—*she'd none to tell!*

How the Women Vote in Kansas.—A Hoosier sees in Kansas many new and unfamiliar sights, but none more interesting than that of the ladies voting. They have the privilege of voting in all matters pertaining to schools. As far as my observation goes, the ladies here have minds of their own. They neither vote for the handsomest man nor the ones their husbands tell them to vote for, unless the candidate is, in their own opinion, the proper one. Their votes can not be bought.

They are universally on the side of morality and temperance; hence the workers in the temperance cause are warm advocates of equal suffrage. Election days pass quietly. If there is any drinking or fighting done, it is not at the polls. Everything is orderly there, notwithstanding contrary reports circulated by anti-suffragists in the Eastern States.

Candidates keep carriages running for the accommodation of the ladies, but a great many walk up and deposit their votes. As the result, so far, has been very satisfactory, even to the men it will probably be but a short time till equal suffrage is granted.

The gentlemen show their gallantry and faith in the ability of the ladies by appointing them to office. The enrolling clerks of the Legislature are ladies, also a large proportion of the County Superintendents, who, in every instance, discharge their duties in a manner that gives universal satisfaction.—*Indianapolis Herald.*

Pauperism in Ireland.—It is terribly on the increase. From the Irish Times we learn that, out of a population of 5,000,000, nearly 300,000 are supported by public relief; and the paupers, we are told, are increasing at the rate of 1,800 a month: To support this vast army of paupers the labor of Ireland is taxed $1,000,000 a year. Of this sum the salaries of workhouse officials and the cost of the prisons eat up nearly $2,000,000. It used to be said Ireland was over-populated. Well, famine killed off 1,000,000 of the people, and scattered 3,000,000 more all over the globe; yet here is Ireland to-day in her rags, with her begging-bag over her shoulder, and her beggar's hand extended for relief! Ireland has natural resources sufficient to support comfortably 50,000,000 of people. Independent of the millions of acres which have been robbed from people, there are millions more of reclaimable land, which, under a wise and a beneficent government, would be sustaining in comfort a happy people instead of what we now see—a pauperized population. Restore the people to their natural inheritance; educate them in the science of agriculture; put improved implements into their hands; enable them to utilize the mineral resources of the country; push on manufactures—in a word diversify industry and abolish landlordism—and in ten short years Ireland will present to the world a picture of contentedness such as no country ever before exhibited, but which, indeed, every country under a system of government conformable to the laws of God may and can exhibit as well.—*Irish World.*

American Exports.—The report of the Bureau of Statistics contains some very surprising figures to show the decline of American commerce, and the gradual but steady manner in which foreign ships have monopolized our carrying trade. The following statement shows the percentage of imports to and exports from the United States carried in vessels of domestic build, from the year 1821 to the present date:

PERCENTAGE CARRIED IN AMERICAN SHIPS.

1821	88.7	1841	84.3	1861	66.5
1822	88.4	1842	82.3	1862	65.2
1823	89.9	1843	77.1	1863	50.0
1824	91.2	1844	78.6	1863	41.4
1825	92.3	1845	81.7	1864	27.5
1826	92.5	1846	81.7	1865	27.5
1827	90.9	1847	76.9	1866	32.2
1828	89.9	1848	77.4	1867	33.9
1829	89.5	1849	75.2	1868	35.1
1840	89.9	1850	72.5	1869	33.1
1831	96.5	1851	72.7	1870	35.6
1832	93.1	1852	70.6	1871	31.8
1833	93.8	1853	69.5	1872	29.1
1834	93.0	1854	70.5	1873	26.4
1835	91.5	1855	75.6	1874	27.2
1836	94.3	1856	75.2	1875	26.2
1837	92.6	1857	70.5	1876	27.7
1838	91.2	1858	73.7	1877	26.9
1839	94 3	1859	66.9	1878	26,3
1840	92.9				

In striking contrast to this has been the growth of the foreign commerce of the United States. While the carrying capacity of American bottoms has grown less and less every year, the demand upon it has increased rapidly, and has been responded to by foreign shipowners. The growth in the export trade of the United States has been enormous, particularly within the last decade. In 1790 the value of domestic exports from the United States was $19,666,000; in 1800, $31,840,903; in 1810, $42,366,675; in 1820, $51,683,640; in 1830, $59,462,029; in 1840, $113,895,634; in 1850, $136,046,912; in 1860, $373,189,274; in 1870, $120,500,275.

Now, mark the progress for the last eight years:

1871	$562,518,651	1875	$613,694,767
1872	549,219,718	1866	644,956,406
1873	649,132,563	1877	676,115,593
1874	693,032,654	1878	722,811,815

The lack of increase and the falling off during the depressed condition of American industries from 1873 to 1876 will be noticed, as returning prosperity is shown in the exports for 1877 and 1878.

Of the total exports last year $557,743,827 were carried in foreign vessels, while only $159,772,720 were carried in vessels of American build.

A Novel Feat in Dentistry.—Scalp-grafting has become a quite common performance, but it will be news to many that teeth may be similarly transplanted and made to grow in other mouths than the original owner. Dr. Thomas of Detroit, details in the Dental Cosmos a case in which he successfully performed this operation; inserting in the mouth of a gentleman, who had lost a right superior cuspidate, a solid and healthy tooth that he had removed from a lady's mouth four weeks previously. He opened into the canal and pulp chamber of the tooth, from the apex of the root only; cut the end off one-eighth of an inch (it being that much too long), reduced the size somewhat in the center of the root (it being a trifle larger than the root extracted), filled and placed it in position. He states that the occlusion, shape and color were perfect, so much so that several dentists who saw the case were not able to distinguish the transplanted tooth from the others. The two features in the case that he calls particular attention to are: first, that although the tooth had been in his office four weeks, there is to-day no perceptible change in color; and, second, that the re-attachment is as perfect as though it had been transplanted or replanted the same day of extraction. Dr. Thomas knows of but two obstacles in the way of the perfect practicability of "transplanting;" first, the difficulty of obtaining the proper teeth at the proper time; and second, the possibility of inoculation. The latter is the more formidable of the two, and, to escape the ills that might follow, the greatest caution is necessary. The first difficulty is more easily gotten over, for it is not necessary that the tooth transplanted should correspond exactly in shape and size to the one extracted; if it is too large, it may be carefully reduced; or, if too small, new osseous deposit will supply the deficiency. Neither is it necessary, as we have seen, that the transplanted tooth should be a freshly extracted one.

In his "True Law of Population" Doubleday points out that "Populations are universally found thin in pastoral countries, where the food is chiefly animal; denser where it is mixed; still denser where vegetable but plenteous; densest of all where it is vegetable and scarce." The natural inference is that in the plethoric state productiveness is arrested, while in the depletheric it is reinvigorated. In the poorest time Irish families subsisting on potatoes and meal, averaged seven, against five in England and three in France. In rice-eating countries the population is dense.

HYGIENE.

The Treatment of Burns.—Experiment and reflection led Dr. Waters to the conclusion that *pressure upon the nerves* is the cause of the pain in burns. He says, "Heat contracts albumen, hardens, stiffens, and thus closes the pores and produces pressure upon the nerves. The application of bicarbonate of soda gives its quick relief by dissolving or softening the albumen in or surrounding the pores, and allowing the restrained contents to escape, relieves the pressure. That the pain is due to pressure is shown by the fact that position is all important in giving relief. If the burnt limb is poised so that the blood will gravitate toward the heart, the relief from pain after applying the alkali is more complete than with the limb in other positions. The practical directions for the treatment are then summarized as follows: My treatment is to apply to the burned surface bicarbonate of soda in fine powder, if it is a wet surface; but if it is a dry burn, use a paste of bicarbonate of soda and water, or a strong solution of the bicarbonate of soda in water, and apply to the burned surface. This relieves sunburns as well as burns from hot coals, melted sulphur, hot iron, steam etc. Always dispose the burned surface so that the blood can gravitate toward the heart if possible, as otherwise a continuous pain may be felt, due to the dilation of the blood vessels from the weight of the contained blood. If bicarbonate of soda is not at hand, bicarbonate of potash is the next best. Then the emulsion of lime water and oil makes a good dressing where the skin is broken. But vaseline is preferable, as there is no odor from it, and it is quite as bland.

Phosphatic Food.—The Manufacturer has the following plea for the special feeding of the brain: "Man is being perpetually renewed; the old and used-up particles are removed from the system, and their place is supplied with the same element newly presented to the organism. Motion destroys a portion of the integrity of a muscle, sight a something from the retina of the eye, and 'thoughts which breathe and words which burn,' literally burn and change into another chemical formula a certain portion of the phosphorous of the brain. Hence arises the necessity of supplying the system with an element on which the mental functions depend more than any other organic ingredient. Experience shows that highly phosphatic and easily digested food, such as soft-boiled eggs, the flesh of fowls, oysters and kale food (phosphorized more than other grains and vegetables) is especially suitable to persons whose minds are overtaxed by intellectual duties, and in purely nervous affections it is recommended by physicians who understand their business. Very recommendable for this purpose is the liquid acid phosphate, because it contains the phosphorous in a condition in which it is most easily assimilated. The idea of partaking of particular kind of food or beverages to nourish the nervous system is rapidly gaining ground, or theoretically accepted as correct. Said a physician lately to us, with whom we conversed on this subject, 'What a fool was I in my ignorance to laugh at the idea of brainal food! Why, sir, it is the most valuable one I ever put in practice. I thank you chemists for it.'"

Medical Effects of Onions.—A mother writes to an English agricultural journal as follows: "Twice a week—and it was generally when we had cold meat minced—I gave the children a dinner which was hailed with delight and looked forward to. This was a dish of boiled onions. The little things knew not that they were taking the best of medicine for expelling what most children suffer from,—worms. Mine were kept free by this remedy alone. It was a medical man who taught me to eat boiled onions as a specific for a cold in the chest. He did not know at the time, till I told him, that they were good for anything else." The editor of the journal adds: "A case is now under our own observation in which a rheumatic patient, an extreme sufferer, finds great relief from eating onions freely, either cooked or raw. He asserts that it is by no means a fancy, and he says so after having persistently tried Turkish baths, galvanism, and nearly all the potions and plasters that are advertised as certain alleviatives or cures."

Cure for Scorpion Sting.—According to Dr. Lucas, a very curious remedy is used in India for the cure of the sting of the scorpion, which is so agonizing to the victim. The first sensation is that of a prick of a finely pointed needle, which is extremely distressing, and is accompanied by a shooting up the limbs, along the course of the main nerve trunk. If a pinch of powdered alum is introduced into the eye on the side affected, the secondary symptoms cease almost instantly, as the conjunctival mucous membrane begins to smart. The local pain is also much less severe than it was, and loses its force in a few hours, this being expedited by firm and steady pressure.

Treatment of Baldness.—A gentleman having lost nearly all his hair after fever, consulted a French doctor who had acquired great reputation in the treatment of such affections. The prescription was a drachm of the tincture of phosphorous to one ounce of castor-oil; the bare scalp to be rubbed with this mixture three times weekly for half an hour each time, after the skin of the head had been thoroughly cleansed with warm water without soap. In about six months the hair began to grow, and in a year was as thick as ever, the new hair being about two shades darker than it had been before.

Houses that have become empty may become fever-breeders when they come to be reoccupied. An English sanitary officer alleges that he has observed typhoid, diphtheria, or other zymotic affections to arise under these circumstances. The cause is supposed to be in the disuse of cisterns, pipes and drains, the processes of putrefaction going on in the impure air in them, the unobstructed access of this air to the house, while the closure of windows and doors effectually shuts out fresh air. Beware of an unoccupied house.

Carbon for Consumption.—A Minneapolis physician recommends this highly carbonaceous mixture in the treatment of consumption: One-half pound finely cut up beefsteak (fresh), one drachm pulverized charcoal, four ounces pulverized sugar, four ounces rye whisky, one pint boiling water. Mix all together, let it stand in a cool place over night, and give from one to two teaspoonfuls, liquid and meat, before each meal.

RECENT LITERATURE.

Victoria Britannica; Or, Celebrate the Reign. By Hollis True. A. Barnes S. & Co., N. Y. Price 75c.

This little volume appears in an exceedingly neat and tasty binding of cloth and gilt. The object of the author is to call attention to the claim the present reign has upon the love and patriotism of the British public, to incorporate certain political changes which shall be an enduring monument to the affection and gratitude of the people to their Queen, and to impress the general public with the "stupendous advantages" accorded by a permanent citizenship of the British Empire. He thinks that though this reign will ever be famous as a glorious era in British History, some fitting manifestation should be incorporated during the the life of the reigning sovereign and gives his views as to the best means of giving expression to and immortalizing the appreciation of the "forty-six millions" of subjects. Those interested in the matter will find suggestions which in time may bear the desired fruit. The book is enthusiastically and generally well written, but its pages are interspersed with some very unique and remarkable original poems. We quote two stanzas from one of these:

Forty-six millions of Britannians are we,
Though scattered the world over—still Britons we'll be;
For Britannia, we love thee, we'll heed no alarms—
Thou hast prairies and forests and orchards and farms.

We're forty-six millions of Britannians—all told—
Each soul is immortal, and cannot be valued at forty-six millions in gold.
What will ye do—ye rich, ye noble, ye chivalrous, brave,
The dying, the hungry, the perishing Briton to save?

Dress. By Mrs. Oliphant, Philadelphia: Porter & Coates.

The most striking characteristic of the book is the common-sense way in which the author treats her subject. She is the golden mean between the radical dress reformer who would sacrifice grace and beauty to health, and the art enthusiast who insists on grace and daintiness, and leaves out of the count the rather important item of appropriateness. The author is unique in that she finds much to admire in present styles—the graceful and charming polonaise, especially receiving a generous meed of praise. It is so much the fashion to hear the prevailing modes railed at that it's quite a delightful surprise to read that our grandmothers did not have a monopoly of taste and common sense in dress. As Mrs. Oliphant very pertinently remarks: "The indiscriminate and unceasing condemnation of critics of every fashion that appears, has anything but a reformatory effect on the object of their satire." Dress is treated by Mrs. Oliphant historically, poetically and practically. The book contains much useful information and many admirable suggestions.

Wood and Steele's Fourteen Weeks in Botany. Published by A. S. Barnes & Co., 111 and 113 Williams St., New York. Cloth. Price, $1.25.

This book is designed for beginners in botany, and it is admirably adapted to introduce this interesting science to the youthful mind. The authors commence the book with simple, familiar plants, and, as the pupil advances, gradually take up the more perplexing features of the study; each step preparing for what follows. Particular attention is given to scientific terms, but they are introduced only when needed, and profuse illustrations throughout the work serve to fix them in the memory.

The Mail Carrier. By Harry Castlemon. Porter & Coates: Phila.

The boys who became interested in the fortunes of Dave Evans, and Don and Bert Gordon, in the former books of the Boy Trapper Series, will hail with delight the opportunity given in The Mail Carrier to follow those young heroes and their compeers through further adventures.

We know of no writer whose stories for boys are more charmingly told or better calculated to interest his young readers than Harry Castlemon's.

MAGAZINES.

Demorest's Magazine for May is brimming over with good things. Two of its most excellent features are the "Correspondents' Class" and the Ladies' Club. In the former all queries relative to art are answered; in the latter, is given information as to literary matters, fashions, household and social interests, in reply to questions. "House and Home" is another department which must commend itself to every lady. In it all affairs pertaining to home, from washing windows to doing the artistic in the way of mantel and bracket draping, are intelligently presented. "The Kitchen" has five columns of most attractive recipes. The number is profusely illustrated. There are thirty-seven fashion cuts, besides engravings of fancy work, designs for working on canvas, a May-day scene, and a colored view of the Harbour of Julie, which latter is an exceptionally pretty picture. Numerous short stories and two serials serve to give spice to the more serious articles. Prominent among these, is Mrs. C. S. Nourse's interesting sketch of Hawthorne; a pleasant talk about Fans, by Mayor L. Ramel; Jennie June's Committee Work in Woman's Club, which contains many admirable suggestions.

For Women.

CONDUCTED BY MISS FAITH RIPLEY.

"TO THEE ALONE!"

A LOVE SONG SET TO MUSIC BY H. R. H. PRINCE LEOPOLD OF ENGLAND.

PRINCE LEOPOLD, who preferred to remain at Darmstadt with the orphans of his sister the Princess Alice rather than attend the wedding of his brother, the Duke of Connaught in Lent, inherits the artistic tastes of his father the Prince Consort, and like his brother the Duke of Edinburgh is a passionate musical amateur. He is something of a composer too, and has just set to music the following pretty love song:

I sat upon the purple hill
And watched the world beneath,
And laughed at love, as cynics will,
When one came o'er the heath.
There was no need to say 'twas she,
No need of sound or sign,
For all the heart leaped out of me
And murmured, "*Dir allien!*"

She spoke—her voice rang silver clear,
The birds hushed in the grove,
The earth stood still that I might hear
The first words of my love.
Ah woe is me I crossed that heath,
For she may ne'er be mine!
Yet must I bear through life and death
This motto, "*Dir allien.*"

I fain would speak, yet dare not, for
Her gentle soul's distress;
What is to me one sorrow more,
So that she have one less!
Yet I could wish when I am dead
Her eyes should look through mine,
And on my heart engraven read
This motto, "*Dir allien.*"

SOME SPRING NOTES.

BY THE EDITOR.

SHOPPING, that pastime so dear to the feminine heart, is fast becoming an art. The "art" consists mainly in an ability to combine taste and judgment in the selection of goods. To enter a store, whose counters overflow with the most exquisite tints and materials—silks, woolens, laces and hosiery—scattered about in seemingly boundless profusion, is simply bewildering. There is nothing displayed which would not be most appropriate and pretty under some circumstances, and it requires considerable skill to choose that which will yield the most satisfaction to the possessor. Ladies who live at long distances from the large centers of trade cannot indulge in the delights and fatigues of shopping, but thanks to the courtesy of city merchants, they need not on that account be deprived of a sight of the novelties that delight their city sisters. The large dry-goods houses furnish samples of their newest and most desirable goods, gratis, to all applicants. I wish just here to contradict a statement which appeared lately in a leading fashion journal, to the effect that only samples of old stuffs were sent out, as houses could not afford to cut up new and expensive goods for samples. This is contrary to the truth. New, costly and elegant dress goods, as well as the plainer grades, are sent out freely to applicants, and no lady who receives samples need fear they are other than new.

READY-MADE COSTUMES.

Ready made costumes are offered in every possible combination of color and material except that a union of woolen goods and plain silk is not to be seen. Satin, satinet, *damasse*, moire-antique and corduroy, have superseded silk as a garniture. Street costumes are almost invariably made with short walking skirt, over-skirt with panier effect and long jacket. The polonaise is mostly used for home and reception dresses.

A brief description of some of the costumes shown me, will serve to give a fair idea of some of the leading styles. Among the more expensive goods was shown a charming costume of gray camels hair with plaided shawl drapery finished with fringe. The effect of the shawl overskirt was pretty and unique. An olive cashmere combined with plaided silk had a curtain overskirt; which style of overdres bids fair to become very popular. A very pretty costume was of blue camel's hair trimmed with blue and gold striped satin and mixed fringe. The jacket and overskirt were trimmed with folds of the satin, the vest was also composed of the same material, and a fold of the satin ornamented the flounce of the skirt. A black bunting trimmed with French lace, showed to good advantage among the gayer fabrics. The popularity of bunting is apparently on the increase, and costumes of it in all colors are shown. In lower priced goods were many charming suits. Gray, *ecru* and brown being the leading shades.

An *ecru* mohair, trimmed with striped satinet, was offered at $15. A gray cloth, trimmed with buttons and ornamented with machine-stitching and black ribbon bows, a comfortable dress for traveling, can be had for $14. A dress of *ecru* camel's hair had the prettiest decoration imaginable. It consisted of broad box-plaitings of brown silk, about three inches wide, and extending from the waist to within four or five inches of the bottom of the overskirt. The three front seams only were ornamented with these box-plaitings, the back of the overskirt being simply draped. A gray cloth suit was tastefully trimmed with blue satin polka dot—vest, cuffs and pipings constituting the trimming—and a black camel's hair was made most elegant by the addition of striped watered silk. The house which furnished me with information for this article have on hand always a full line of mourning outfits—dresses, wraps, gloves and bonnets—so that those living out of town need experience no delay in having their mourning made ready.

WRAPPERS, CHILDREN'S SUITS AND WORSTED SHAWLS.

A pretty wrapper of French nainsook was made in Princess style and trimmed with Italian lace and Chinese ribbon; *a jabot* of the lace and ribbon extending the whole length of the back had a very pleasing effect. The bits of brightly flowered ribbon peeping out from the folds of lace had an exquisitely dainty appearance. Lawn wrappers, trimmed with lace around the neck, wrist and pockets, and with double row down the front, cost from $3 to $6.

One particularly pretty wrapper of lawn had a flounce edged each side with Torchon lace and trimmed with bands of insertion, the neck being finished with a yoke of tucks and insertion. For little people there are some charming slips of lawn and nainsook. One a French nainsook box plaited trimmed with insertions and edgings of Russet lace was offered at $3.75. White lawns trimmed with Maltese and Italian lace can be had in all sizes for children at $3, $4, $5. A pretty little Princess of light blue silk, cut in points and trimmed with Breton lace suitable for child of 6 years was shown, price $15. Cashmeres in all colors piped with silk and edged with lace in all sizes, from $10 up. Cheviot Princess dresses with embroidery and lace from $4. Bunting suits, cutaway jacket, and kilt skirt, navy blue and cameo from $7.25. Silk and worsted suits *ecru*, same style as bunting suits from $7.25. Checks, all wool and silk and wool from $5. *Piques* in Princess style with embroidery $3 in two pieces for misses $8.25. Cambric slips for children from 3 to 7 years 70c; large sizes in three pieces for misses of 16 from $5. Cambric suits trimmed with lace or embroidery size for 10 years from $2.

A most charming variety of light worsted shawls is exhibited. The Algerine stripe, satinet, cashmere, Woolloomooloo are a few of the novelties. They make a pretty addition to the toilet in summer and as they come in all shades from the daintiest of blues to the most aggressive of reds, including many of neutral tints, ladies need have no fear but that their complexion or dress can be "matched." In price they range from $2.50 to $11.

WRAPS.

The materials used for outside garments are silk, camel's hair Imperial cloth and cashmere. The most popular shapes are the dolman and the mantle. The dolman is really a mantle with sleeves. Lace, fringe, *passementerie* and embroidery are trimmings most in use. The wraps are all short, some hardly extending below the waist line, and even the largest of them fall only a little below the hips. The fronts are usually long, reaching to the knee; but in some instances even these are curtailed. Pretty embroidered mantles come from $9 to $18. These are simple and elegant. A novelty is the lace fichu; it resembles the old-fashioned "Bertha." The foundation is netting embroidered with braid; French lace, fringe and satin bows complete the pretty garment which sells for $12.50. A grenadine wrap, trimmed with three rows of plaited lace, and a jet beading, with long tabs in front, made a ladylike and tasteful wrap. Cashmere trimmed with plaited French lace, and pipings and bows of satin; Sicilienne silk, finished with deep, rich fringe and a profusion of handsome lace; light cloth ornamented with grass fringe, Imperial cloth with crimped fringe, French lace and bows as a garniture; and camel's hair, trimmed with silk and fringe, are a few of the many elegant designs in wraps which are to be seen. The prices range from $8 to $30. Some very rich garments come, of course, much higher. The walking jackets, marvels of simplicity and stylishness are made in diagonal cloths, trimmed with buttons only. They are deservedly popular. The price ranges from $8 to $15. A hint now to the judicious. Cloaks and wraps carried over from last season, can be purchased at one-third the price previously asked for them. The material used is of the best. The head and front of their offending is simply that they are not the very latest novelties. A little alteration will, however, transform them into the most fashionable of garments. A wrap of this class, composed of cashmere, beaded *passementerie*, and moss trimming is now offered at $17, price last year $18. Children's cloaks are made of camel's hair or other soft cloths in *ecru* or gray, and trimmed with bows and buttons. There are two styles, walking coat and sacque, sizes from four to fourteen years. For four years, price $2 and $7, according to style chosen. For fourteen years, price $4 and $9. Ulsters are made in a great variety of fancy mixed cloths, and small checks as well as plain cloths. They are abundantly well supplied with pockets, that heretofore neglected item in womanly attire. The comfortable and useful ulster comes at from $5 to $12.

The inexorable compositor announces that my space is "used up." I shall therefore have reluctantly to postpone for another week the discussion of millinery, woolen goods, cambrics, organdines, lawns and hosiery. I shall also publish quite an elaborate article on silks, plain and colored, *damasses*, satins, &c., with full list of prices.

Thanks are due Messrs. Lord & Taylor for their courtesy in supplying me with information as to styles. In reply to questions, they stated that samples of all goods were furnished to applicants, and that out-of-town orders for ready-made garments could be promptly and satisfactorily filled if parties ordering would state bust and waist measure, length of sleeve, and limit of price they are willing to give.

MR. G. A. Sala, writing in the Illustrated London News, of the "higher education of women," holds that if clever girls were "taught to paint on porcelain, to model in clay and wax, to turn, to carve, and especially to draw on wood, they would be a hundred times better employed and fifty times nearer the possibility of earning from three to ten pounds sterling a week than in 'spanking' the piano."

LETTERS FROM A COUNTRY GIRL.—No. 12.

MARGARET B. HARVEY.

HOME STUDY.

OVER and over again do we read very kind, sympathetic articles addressed to women who are burdened with many cares, advising them to make some little effort, whatever happens, to keep up with the times and increase their knowledge. The writers of most of these fully recognize the difficulties which will be likely to beset any woman who undertakes to follow their advice, and indeed they are many—so many, that some of our toiling sisters think such exhortations of little value. Perhaps some are not of much, fair friends, to *you*; but if they have done as little as inspire within you a *desire* for broader culture, they have accomplished a great deal, for the desire is half the battle. I do not hesitate to say that this is a subject upon which it is almost impossible to write too much.

In attempting to talk, as I want to, about studying at home, I shall present to your consideration a few thoughts upon which we may all ponder with profit. First of all, the duty of everyone of you is to yourself as an individual soul, and all your duties to others grow directly out of your right performance of this one. It is incumbent upon you to make every effort to ennoble yourself to take care of your health, to have a proper pride in your appearance, to feel that it is your primary obligation to be a lady, to take into account every factor which can aid in giving as a result a beautiful, refined, cultured woman. So, then, it must be your work to hold subordinate to your higher development, every toil and care and anxiety, and to determine that you will be to your dear ones a creature whom they can love, not only because she is their very own and their best friend, but also because they can take a rational pride in her as one who has conscientiously tried to make the best of herself. We read often of hard-working mothers who "slaved their very hearts out" for their families, only to be despised by them at last, and then follows a long string of commentaries upon the ingratitude of children. Well, I say, those same mothers could not have expected anything else, for it was all unnatural. Any ordinary set of growing young people—newly-fledged ladies and gentlemen—would twenty times rather see their mother, with her pretty dress, graceful manners and intelligent conversation, entertaining visitors around a simply-spread table, than to have her dowdy, worn and illiterate, seated with them at a sumptuous repast. And I cannot blame them.

Remember, then, that your duty to your children begins with your duty to yourself. That you may not stint them of what they can reasonably require of you, you must never lose sight of the fact that mind is superior to matter—your mental development and theirs must transcend every physical consideration. Body is servant; soul, master. The master must find opportunity for receiving the honor due to his position, even if he thereby must occasionally order a suspension of the labors of his servant.

A LITTLE KNOWLEDGE.

You believe all this, and have decided to accomplish something. What? The mastery of any one art, or language, or science, or even general literature? Very well, if you have *decided*, you probably will. But, generally speaking, I would not advise you to determine all at once. You will probably find it far more difficult than you had anticipated, and so grow discouraged and give up altogether. The better plan is to be modest and say that you will be content with learning a little, and as you find your field widening, you will be better able to say what you will undertake in earnest. You will make an effort, not because you ever expect to paint a wonderful picture, or spend years abroad, or make any great discovery, or accumulate a vast library, but because you wish to add something to your general culture. And the smallest amount of study will enable you to do this.

You have been told many a time, perhaps, that "A little learning is a dangerous thing," and you hear a great deal of talk about "a mere smattering" and "a very superficial knowledge." Well—but some of my friends believe that "half a loaf is better than no bread." When all is said and done, what does the wisdom of all mankind amount to, but "a little learning?" And then, too, does not every one at first have to acquire "a mere smattering" and "a very superficial knowledge" of anything before he can go any further? And, even stopping at that point, does he not know a little more than he did before? And does not a little fact or circumstance which we *do* know, often help us wonderfully in what we do not, throwing light on a dark place, and aiding us to discover what, perhaps, we otherwise never should? Be sure of a "little," at any rate, and then go on and "drink deep," *if you can*.

HOW TO STUDY.

Just *how* you will study depends upon yourself, but if you try, you will find that you can wring assistance out of the things around you. And this is far different from having any certain hours set apart for your books, which only a very extraordinary woman, I believe, can do and keep them unbroken, if she has any other interests. Take as many hours—full, precious hours—as you can, but don't despair if you never can find one. Listen a little, if you will, to a few passages from my own experience.

When I was very young an old copy of Mrs. Lincoln's Botany for Beginners accidentally fell into my hands. The system taught in it had been superseded, but I did not know that. For months I could think and talk of nothing but Botany; and in my morning walk to the village school, and my evening errands after the cows and down to the spring-house, I would pause for an instant to gather a "specimen," just as you do to pluck a wild-rose or daisy which pleases your fancy. Analysis took the place of tatting, and as a child, I learned many, many names which I never had to unlearn. As I grew older I procured suitable works—Mrs. Lincoln's latest edition, Coultas, Darlington and Gray—and continued my researches. Instead of excursions merely for pleasure, I had my "scientific explorations." I never felt that my Botany took an instant of my time, and to day I believe I am "pretty well up" in the Flora of my own district.

To learn my French conjugations, I had the book lying wide open on the end of the ironing-board. Every time I crossed the floor to change an iron, I glanced at the page long enough to take in one tense, and this I repeated, over and over to myself, until I needed to change my iron again. I did not give up this practice till I knew them all. And the law of association is so strong that I cannot see an ironing-board now, without involuntarily running over in my mind, "*J'ai, tu as, il a.*" And my ironing was not spoiled, either,—I always had the reputation of doing it beautifully, even if I never could believe that "towels and dish-cloths ought to look *just as nice* on the horse as ruffled petticoats."

The same way with my Latin paradigms. When I had on hand that most useful and necessary, but at the same time, most tedious and trifling employment of darning stockings, I elevated it by having the grammar on the stand beside me. As I worked, I recited aloud what I had read an instant before, just as with the French, and so, too, does every pair of mended hose sing, "*Amo, amas, amat.*" And so far from slighting my needle, I felt then that I could afford to give more time to it, and the darning done under these circumstances looked as even and regular as Java canvas. And the whole while I was teaching, just in the few minutes intervening between breakfast and "train-time," I would run my fingers up and down the keys, not attempting to practice any portion of a "piece," for just a simple scale, persevered in, is far better than nothing at all, and does one a great deal of good giving freedom.

You must not *think* about studying you must *do* it. While you are questioning and cogitating, "Had I better? Ought I not do something else? While I am learning that rule I might be finishing Jessie's apron, etc.," the opportune moments have gone. If you were thirsty, you wouldn't stop to say, "Ought I get some water now? Couldn't I get along without? Mightn't I be doing something else?" You would take up your bucket in an instant, without the slightest parley. Yet you wouldn't, in an aggregate of your time, count the minutes you had spent in going to and from the pump. And this is the way in which you must study. Wherever you feel like it, open your book, as a matter of course, on the very instant, without stopping to consider, and,—that is, if you are judicious,—you won't lose anything which you cannot easily pick up again.

Have a book always on your bureau, on your centre-table, on your mantel-piece, on your kitchen-dresser. Run to the piano, even if you stand at it, while you are waiting for the kettle to boil or the dust to settle. Look up a little fact as you are dressing to go out, think over it during your walk, and on your return verify all the suggestions it has given you, while you are putting away your things. Take a book in your satchel to read in the waiting-room at the depot—read in the cars, even, unless the characters or the scenery about you form a far more interesting study, as they often do. Associate one name and one date and one event with another, and all with a certain article of furniture, or corner of your place, so that you cannot think of one without all, and then build upon these until you have a whole series constituting the very skeleton of some particular branch of human knowledge. A thousand little devices will present themselves to you—the only caution I can give is, don't encroach upon your needed rest, or upon the attentions your family require. You have all heard of Elihu Burritt, the learned blacksmith, who mastered thirty languages by having always a book upon his forge. Perhaps you do not know quite so much of Miss Grace Anna Lewis. Her home is right in the wilds of Pennsylvania, three miles out in the country from Kimberton, a little place so remote that it holds communication with the outer world by only one or two trains a day, through Phœnixville, itself a small town twenty-eight miles from Philadelphia. She has lived here almost all her life, with no more opportunities than any country woman has. Yet she to-day, is the greatest living authority on birds in America. No one need be ignorant.

In the columns of the RURAL a short time ago, was given as much as I can tell you of the Boston Society to Encourage Studies at Home. The yearly fee, as you remember, is two dollars; courses on different subjects are marked out and help is given by correspondence. I think it a very good idea for a woman to connect herself with this association. Plans of study will be sent her by those experienced, far better than she could have made for herself, and her feeling obliged to write a monthly letter containing a report of her progress, will give her, from time to time, a present, definite object for which to work.

What has been done, can be done.

A HINT FOR FORGETFUL ACTORS.

WE commend to amateur actors who are troubled with bad memories, the happy idea of our friend C. Though still a young man, he was to play the father, and the daughter chanced to be a very handsome woman. So when he forgot his part, he could think of nothing better than while holding his "child" to say:

"Kiss your father."

And each time when he felt that his memory was about to fail, he would save himself by crying out:

"Come to my arms, my child."

The husband of the "daughter" said that he thought that the "author repeated himself very often."

Maud Miller, daughter of Joaquin Miller, has made her first appearance in a speaking part on the stage in Oregon.

"THE RURAL" CORN PREMIUMS.

Classification of Premiums and Conditions to be fulfilled by

ALL COMPETING FOR THEM.

Conditions of Cultivation.

ANY fertilizer or manure may be used in any quantity. The method of cultivation is optional with the cultivator. Our only restriction is that the area planted be WITHIN *one-fortieth of an acre*, or 33 *feet square*. We have kept an account of the *average* number of kernels sent out to each applicant. In each package, unsound kernels will be found. These may, of course, be rejected. But *the exact number of kernels* (whether 125 or 145 or any other number) *planted*, must be stated in the statement of results obtained.

It will be well for each contestant to provide himself with *proof* of his entire proceeding, such as the evidence of a Justice or other competent authority.

We shall want to know the *quantity* of shelled corn and its *weight* produced from our seed, the weight of fodder, average number of ears to stalk; what kind of fertilizer was used, if any, the distance between rows and plants, time of planting and mode of culture. When these statements shall all have reached us and been carefully examined and compared, we shall announce the distribution of the following premiums:

Prizes.

No. 1. $100 in gold given by the proprietors of THE RURAL NEW-YORKER for the yield that shall have most successfully fulfilled all the conditions, and attained the highest general average of points.

No. 2. A FEED AND MEAL MILL (value $65), given by the CHALLENGE MILL CO., of Batavia, Ill., for the yield that is next in order.

[NOTE.—This mill is adapted to wind- or horse-power and has a capacity of 20 bushels per hour at a speed of from 800 to 1000 revolutions per minute. It is equipped with "shake feed" attachment, and has an established reputation for the excellence of its work and the substantial manner in which it is constructed. Circulars fully descriptive will be sent by the company on application.]

No. 3. The improved BIG GIANT FEED MILL (value $45), contributed by J. A. FIELD, SON & Co., St. Louis, Mo., for the third best result accruing from the competition.

[NOTE.—This is one of the best corn and feed mills before the farming public. It is adapted to horse-power. It grinds corn with the shuck on without extra attachments, and while grinding shelled corn fine enough for family use, it will also grind corn and cobs successfully. The mill has taken the highest premiums at the St. Louis Fair, and has been likewise honored wherever exhibited. It will be shipped on boat or cars at St. Louis, free of charge. The firm will send particulars on application.]

No. 4. The "VETERAN" CORN SHELLER (value, $35), made by the SANDWICH M'F'G CO., of Sandwich, Ill., and given by them as a prize for the fourth best result.

[NOTE.—This is a very complete sheller and perfect separator, that works satisfactorily as a power machine. Indeed, it may be fitted with a band-wheel and feed-table, making it a very convenient small power sheller. It has a revolving wire cob-rake, and a fan for cleaning the corn. We refer our readers to the company for fuller particulars.]

No. 5. The WHEELER & MELICH CO., of Albany, N. Y., give a choice of their LA DOW'S PULVERIZING HARROW, or a two-horse DISC CORN CULTIVATOR (value, $30), for the fifth prize.

[NOTE.—Both of these implements have been illustrated and described in THE RURAL, the Corn Cultivator in the issue of March 8. They are thorough pulverizers, and fit the soil for the best results to be derived from cultivation. The implements contain novel practical features that are commended to farmers' attention, and either the corn cultivator or harrow is one of the most attractive prizes in the list.]

No. 6. For the yield of corn, sixth in order of merit, MESSRS. RUMSEY & CO., of Seneca Falls, N. Y., offer a choice of anything from their catalogue to the value of $25.

[NOTE.—R. & Co., are very extensive workers in iron castings, and suggest that our competitors may find one of their Garden Engines, Hydraulic Rams, Force-Pumps or Farm Bells an appropriate prize. The Catalogue from which to select is at the service of all who may choose to apply for it.]

NOS. 7 AND 8.—TWO HAND CORN-SHELLERS (value, $5 each), donated by LIVINGSTON & Co., of Pittsburgh, Pa., for the seventh and eighth best results from the Corn Distribution.

[NOTE.—These small shellers are convenience itself. We have had one in constant use at the RURAL EXPERIMENTAL FARM, and have found it to fulfill everything claimed for it by the makers.]

Farmers' Publishing Company.

1. For best weight of Shelled Corn per bushel, to be weighed three months after harvest, 30 vols. of Harper's Half-hour Series.
2. For second best, Dicken's Works, in 19 vols., (D. Appleton & Co.)
3. For third best, books from Scribner's Catalogue to the amount of $5.
4. For fourth best, The Wilson Series of Agricultural Works, in cloth.
5. For fifth best, one year's subscription to RURAL NEW-YORKER.
6. For sixth best, Miles's Stock-breeding.

Total value not less than $30.

All who intend to compete for the above premiums must give us notice of their intention so to do before June 1st, by postal card or letter.

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

HOUSE-CLEANING.

AMBITIOUS housewives usually begin spring renovation entirely too early. By doing so, they expose their families to colds and general discomfort. The disorder that frequently reigns throughout the house at such a time, makes the husband and children feel as if there were "no place to stay." Ladies have told me that weeks and months of illness were brought upon them by taking cold when house-cleaning while the weather was still wintry, except in name. But they couldn't endure dingy windows and dusty carpets any longer, and so imprudently went to work in the face of "chill airs and wintry winds," and suffered in consequence.

How disagreeable to take up carpets and clean floors and windows, and to hear the scrubbing-brush and the splash of suds at a season when the outside air chills one through! By cleaning house very thoroughly in autumn, there need not be so much haste about the spring house-cleaning. In that case, the house will keep tolerably clean until the weather becomes settled and warm enough to warrant us in undertaking this annual domestic revolution.

There is much truth in the saying, that "*One* keep clean is worth *two* make cleans." Some people can't learn that handles are put on doors to open and shut them by. If they would, we should be spared seeing ugly finger-marks above and below the knobs, and the paint washed off in the attempt to remove the stain. The stoves are almost always taken down and put away at house-cleaning time, but it is a bad plan not to leave at least *one* up, besides the kitchen stove, unless there is a grate in the house. There are days in summer when a little fire in the morning and evening is very agreeable. The preparations for house-cleaning should be made some days before the work actually begins. A supply of all the articles needed should be on hand, to save time after the work is under way. Time and again, I have heard ladies say, "I could have finished putting down the carpet yesterday, but the tacks gave out, and there was nobody to send for more, and I was too tired to go myself." Ammonia is a labor-saving agent in house-cleaning, but must be considerably reduced with soft water, for if too strong, it is injurious to the paint. It should be very weak, also, for washing window-glass. Use a large sponge, rinse well, dry with soft linen and rub with paper or chamois, and they will be very clear. Housekeepers will find that by cleaning only one room at a time, and using a little womanly tact a general uproar may be avoided, and that the entire house may be renovated with comparatively little inconvenience to themselves and family.

M. G. R.

Lyons, Iowa.

DOMESTIC RECIPES.

Asparagus Omelette.

Boil a good-sized bunch of asparagus until tender; let get cold; cut off the green part only and chop fine. Beat six eggs until very light; add two tablespoonfuls of thin, sweet cream and the chopped asparagus. Have ready a frying-pan with a tablespoonful of butter melted in it, but not smoking hot, and pour in the mixture. Shake from the bottom as it forms, and loosen from the pan with a broad knife. Fold over in the middle and turn on to a hot platter. Sprinkle over salt and pepper and serve.

MARY B.

Cress Salad.

Cut up, but not too fine, and pile into a salad-bowl. Sprinkle with a little powdered sugar. Then prepare a dressing by working up a half teaspoonful each of salt, pepper and made mustard, with two tablespoonfuls of oil or melted butter; when thoroughly mixed, add drop by drop—beating all the time—four or five tablespoonfuls of vinegar. Pour over the salad and toss up with a fork.

MRS. JAMES PRINE.

QUESTIONS ANSWERED.

Worcestershire and Caper Sauces, Commercial Citron and Fruit Jars.

Mrs. M. Wilhite, S. C. says: "Can you give through your Household Department a recipe for making Worcestershire and Caper sauces like what we buy? Also a recipe for making citron like that we buy? What kind of melon must I use, the nutmeg, Jenny Lind or what, and how can I keep the fruit green and firm, how flavor etc?

At the Centennial I remember seeing a fruit jar, and I think it was patented by Mrs. Haller of New York, which varied in size from two or three ounces to one quart or gallon. Now if possible, can you tell me where I can find them? I think they were called the 'Vacuum Self-sealing Cans.' The Vacuum was in the glass stopper or top."

ANS.—WORCESTERSHIRE SAUCE: One quart of *thin*, tomato catsup made and spiced the usual way with the addition of more cayenne pepper and a sufficient quantity of crushed garlic, added to the catsup while boiling and before it is strained, to give it a decided garlic taste. Then add enough soy sauce—to be obtained at almost any good grocery store—to make the catsup a deep chocolate color, two tablespoonfuls will probably be sufficient. This is an original recipe and one which has taken the place of Worcestershire and other sauces in our family off and on for twenty years, and we wish you would give it a trial.

The recipes given in encyclopedias are a little too complicated and "fussy" for home manufacture. We append, however, the best at our command.

WORCESTERSHIRE SAUCE: Mix together one and one-half gallon of white-wine vinegar, one gallon of walnut catsup, one gallon of mushroom catsup, one-half gallon of Madeira wine, one-half gallon of Canton soy, two and a half pounds of moist sugar, nineteen ounces of salt, three ounces of powdered capsicum, one and one-half ounce each of pimento and coriander, one and one-half ounce chutney, three-fourths ounce each of cloves, mace, and cinnamon and six and a half drachms assafœtida dissolved in one pint of brandy 20 deg. above proof. Boil two pounds of hog's liver for twelve hours in one gallon of water, adding water as required to keep up the quantity; then mix the boiled liver thoroughly with the water; strain it through a coarse sieve, and add to the sauce.

CAPER SAUCE: The flower-buds of *Capparis spinosa* and other species of this Mediterranean shrub are preserved in salt and vinegar and are known and exported as Capers. For a home substitute Nasturtium fruits, see RURAL of April 12, answer very well.

CITRON: The commercial citron is the preserved rind or flesh of the genus Citrus, to which the orange and lemon belong. It is imported in large quantities from Italy and is prepared by first being slightly cooked in a rich syrup and then partially dried and packed as seen when imported.

A substitute for the above may be made by boiling the *Citron melon* as for preserves, then spread on dishes to dry slowly, sprinkling several times with powdered sugar and turning until it is dried enough. Pack in jars with sugar between the layers. Or, boil in the usual way until the syrup is very thick, turn into jars and instead of covering, leave them open for the air to enter and dry the preserve gradually.

VACUUM FRUIT JARS: We do not know where said jars can be purchased.

News of the Week.

MISCELLANEOUS.

Monday, April 21, 1879.

Gen. John A. Dix is at the point of death; no hope is entertained of his recovery. Our Congressional spouters are reported to be tongue-tired and willing to go home. The Committee on Agriculture has reported back the bill granting $250,000 towards suppressing contagious diseases among stock. It is urged that the several affected States should be permitted to spend the money in proportion to the ravages in each. Gen. Patrick, who is charged with the duty of stamping out pleuro-pneumonia in this State, on April 19 issued an order peremptorily prohibiting the importation into New York of cattle from New Jersey, after April 23. This action he takes "having full evidence that the contagious pleuro-pneumonia of cattle is extensively prevalent in New Jersey, and that the herds of New York are being infected thereby."

But while Congress, the States of New York and New Jersey, our Department of Agriculture and best veterinarian authorities agree that there are in isolated parts of this country a considerable number of cases of genuine pleuro-pneumonia, and Great Britain's action in regard to our cattle trade strongly confirms this authoritative opinion, a few agricultural papers here and there still affect to doubt whether the disease declared to be pleuro-pneumonia on this side of the Atlantic is the genuine article. They do not pretend that they have made any personal investigation into the matter or that they are qualified to do so, but they base their views on the opinions of a few second-rate veterinarians here who were privately paid for those opinions, and on the fact that a Scotch veterinarian who has a book to sell, cheaply advertises himself by expressing a doubt whether the American cattle killed at Liverpool on the plea that they were effected with pleuro-pneumonia, were troubled with a Simon-pure form of that disease. Here's richness for you!

Gigantic Offers.—Your attention is called to the mammoth new advertisement of Mr. Daniel F. Beatty of Washington, New Jersey, in this week's paper. Mr. Beatty's celebrated Pianos and Organs are so well known throughout the civilized world that they require no word of commendation from us. Lowest prices, superior workmanship and complete satisfaction have brought this maker prominently forward, until to-day he stands the only man in his trade who dares to ship his instruments on test trial, and if unsatisfactory refunds not only the price, but all freight paid. No fairer offer can ever be made or even suggested. His sales now amount annually to several millions of dollars, and when it is taken into consideration that a few years ago he was only a poor plow-boy, it must be evident to every reader that Mr. Beatty is the possessor of rare talent in his vocation. A saving of 5 per cent. can be made when two instruments are ordered at the same time, therefore talk over among your friends and neighbors these unparalleled offers on the celebrated Beatty Pianos and Organs, and try to secure for yourselves this special discout.

We believe the cause of the wonderful success of our MURRAY & LANMAN'S FLORIDA WATER may be found in the fact that the principal aim in its preparation has always been to give the simple *natural perfume of flowers*, without any chemical addition whatever, and so avoid, by all means, the great error of making a heavy, sickly, sweet perfume.

The Perfect Creamer is a great success. It excels all other systems in quantity and perfect quality of butter made from a given quantity of milk. The increase in value of product will pay for it in one season. See adv. in another place.

The best method of setting milk is by use of the PERFECT CREAMER OR BUREAU MILK PANS. It maintains a uniform temperature at all seasons, excludes flies and dust, uses but a very small quantity of ice. Is the most economical in time, labor, and money of any system ever devised.

All your own fault if you remain sick or out of health, when you can get Hop Bitters.

THE MARKETS.

PRODUCE AND PROVISIONS

NEW YORK, Saturday, April 19th, 1879.

BEANS AND PEAS.—The call for marrow beans is not so sharp as it was at our last, but prices are repeated. Mediums steady with light sales of best. Red kidneys quoted as high as before with sales. White kidneys dull at the moment, may sell later on. Pea beans without inquiry. Green peas $1 70 from store; truck lots easier. Southern B. E. peas, $2 50@2 55 per 2 bushel bag; Canadian, in bulk and bond, 75@77c. Medium beans, choice, $1 30@1 35, fair to good, $1 15@1 25, Marrow, prime, free on vessels, $1 40; fair to good, $1 20@1 35; pea, $1 20@1 35; white kidney, $1 35@1 55; red, $2 50@2 70; black, $2 15@2 25. California Lima, $4@4 25.

Receipts for week, beans, 7,644 bush.; exports, 752 bbls.; do, peas, 4,100 bush.

BROOM CORN.—Offerings are freer, but prices hold fairly steady.

Brush and short broom, choice, ₽ lb., 5½@6½c.; do. common to good, 4½@5½c.; hurl, good to choice, 3½@4½c.; do., common to fair, 3@3½c.; red and crooked, 2@3c.

BUTTER.—The situation is merely a repetition of ordinary early spring business. Irregular quality of new keeps buying down to actual daily wants of distributors. Stock the least rapid is at once rejected. Enlarged arrivals give buyers more independence and shade prices for best fresh sweet-flavored lots. About all the merit that hay butter possesses is fleeting sweet flavor, and receivers are forced to yield or risk a break in their line of customers. The spring hereabouts is backward; this is a kind of salvation for some lots of old. That is, it gives it a chance to work out. The question of prices is another matter. Buyers at this time always talk up the precedence new has obtained and dictate terms for old. When a shipper is negotiating, dictation is certain to form part of the transaction.

OLD BUTTER ranges at 7@14c. for State, Welsh tubs, half tubs and firkins; creamery, 10@17c.; Western prime firkins, 7½@8½c.; poor to fair factory, 5@6c.; grease, 4@4½c.

NEW BUTTER.—State pails and half tubs, choice, 16@17c.; good to prime, 14@17c.; fair to good, 12@14c.; Welsh tubs, choice, 14c.; good to prime, 14@15c.; fair to good, 13@14c.; poor to fair, 8@12c.; State creamery, best invoices, 22c.; good to prime, 20@21c.; Western, best invoices, 20@22c.; fair to prime, 17@19c.; imitation creamery, 14@17c.; Western, dairy, fair to best, 11@15c.; factory, 10@14c.; common, 7@9c.

CHEESE.—The export movement is limited, only about 16,000 boxes taken for the week. Receipts are small, however, and the stock is reduced, with prices held steady.

Sales at 8@8½c. for fine lots; 6½@7½c. for good; 5½@6c. for fair; 3@3½c. for skimmed; 4@6c. for half skimmed. Wisconsin factory, fine and fancy, at 8@8½c.; do. good to prime, at 6½@7½c.; Western factory, fine 7@7½c.; good and prime, 5½@6½c.; do. full skimmed, 2@4c.; do. half skimmed, at 3@5c.

Receipts for week, 5,618 boxes.

Liverpool cable, 41s.

Liverpool steam, 27s. 6d.

COTTON—Has tended higher again this week, and active speculative demands based chiefly on the general statistical position. Latest prices are for April, 11.80@11.82c.; May, 11.91@11.92c.; June, 12.03@12.04c.; July 12.24c.; August, 12.36@12.37c.; September, 12.09@12.10c.; October, 11.54@11.55c.; November, 11.14@11.16c.; December, 11.07@11.09c.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted:

	Uplands.	*N. Orleans.*	*Texas.*

Strict good ordinary	10⅜	Middling	11 9-16

CORN MEAL.—Sales are of Western yellow at $2.00@$2.35, and Brandywine at $2.50.

DRIED FRUITS.—Shippers have been freer buyers of quarters and for desirable stock meets strong prices. Peaches are steady and unchanged. Small fruits are generally slow.

Alden's evaporated apples are quoted at 11¼c.; Williams's, 10¾@11c.; new process apples at 8½@9c. State plums, 13⅝@14c.; Blackberries quoted at 4¼c. Peaches—Peeled Georgia, 7@7½c. for poor; 8½@9c. for fair to good; 10c. for prime; choice North Carolina, 12@13c.; good do., 9@10c.; unpeeled halves, 3@3¼c. quarters, 2¼@3c. Pitted cherries, 20c. Apples—New, 2¾@2¾c. for southern quarters in bags; 3¾@4¼c. for prime sliced; do., fair at 3@3½c. State at 4@4½c. for new sliced; and 3¾@4¼c. for quarters; Western at 3¼@4c. for new quarters. Raspberries, 23c.

Exports dried fruit, 1,055 bbls. apples.

EGGS.—Receipts for week, 17,500 bbls.; do. last week, 18,500. The surplus from Easter supplies usually keeps retailers away from receivers several days of the week following the holiday. This week, however, the market has been well attended, and prices are easy enough to protract the moment. Ducks eggs are cheaper, 15@18c.; pretty tint or shell does not count for much after the feast. Goose eggs have declined nearly one-half; quoted, 25@30c.

Near points, hen, 12@13c. doz.; State and Penn., 12@12½c.; Western, 12c.; Southern, 11@11½c.; inferior S. and W., 10@10½c.

FLOUR.—There has been more of a pressure to sell on lower wheat values, and prices have eased off a little.

Latest prices are $3.25@3.60 for inferior to choice

superfine State (fancy lots a shade higher); $3.60 @3.90 for very poor to good extra do., odd lots and lines; $3.90@4.25 for good to very choice do.; $3.25@ 3.60 for inferior to very choice superfine Indiana, Iowa, Michigan, &c.; $3.60@3.90 for very inferior to good shipping extra do., and $3.90@4.25 for good to very choice extra do.; common to about choice white wheat extras, $4.25@5.25; choice to fancy do. at $5.50@6.25; red and amber winter wheat, very inferior to very choice trade and family, at $4.00@5.75; round hoop Ohio at $3.85@$4.25, selling mostly at $4.00@4.15; and trade and family brands of do. at $4.35@5.75, the latter rate for very choice; St. Louis, $4.00@5.00 for very inferior to good extra; $5.00@6.00 for good to very choice (with a few very fancy brands up to $6.50); Minnesota clear, very inferior to fancy, at $3.60 @4.75, few brands going above $4.50; Minnesota "straight," very inferior to strictly choice at $4.25@ 5.75; and patent poor to strictly fancy at $5.25@8.50, few brands going above $7.00; unsound stock at from $2.25@5.00; city mill extra at $4.70@5.15 for West Indies (the latter rate for fancy in new packages); do. for England $3.75@3.90; do. trade and family extras, $5.25@6.25; do. for South America, $5.15@5.65 for fair to very choice; No. 2 at $2.35@3.35 for poor to choice.

FURS AND SKINS.—Muskrat have declined to 7@ 10c. for fall; 10@15c. for winter; 13@18c. for spring.

FRESH FRUITS.—In apples an advance in greenings is noted. Some ice-house red fruit bring new rates quoted. Exports for week, 4,469 bbls. New rates as follows: Spitzenburgs, $3@3.50 bbl.; Greenings, State, $3@3.50; do. Eastern, $2@2.50; Baldwins, $2.25@2.75; Russets, $2@2.25; common apples, $1.50. Cranberries, $7@8.50 for bbls. and $2.25@3 for crates. Strawberries arrive in poor condition and have a wide range; poor, 5@10c. ₩ quart; fair, 15@20c.; choice, 25c.; hot-house do., $1@1.25. Demand light for peanuts; inside rates generally accepted. Fla. oranges no longer of importance; a few selections for Broadway are $6@7 per box. Virginia hand-picked, $1.20@1.25; other, 90c.@1.05; shelled, 4½@5c. Pecans, 6@8c.

GRAIN.—Prices are generally lower on tame English advices, and free sellers on speculative account. Latest sales are of No. 3 spring at 9.@10½c; rejected spring at 75@76c.; ungraded spring at 85@89c.; No. 2 spring at 93c.@$1 01; ungraded amber at $1 18@ 1 20; No. 2 amber, in lots, at $ 00½c.; ungraded red at 97c.@$1 11; No. 3 red at $1 07; No. 2 red, in lots, at $1 12½, ungraded white at $1 10; No. 2 white at $1 0.½; extra white $1 12@1 12½; No. 1 white at $1 09½ @1 10; No. 2 white at $1 0.½; No. 2 Northwest spring, June option, at $1; New York No. 2 spring, May option, at 93½c; do., June option, at 9.½@99½c.; No. 2 amber, April option, at $1 10; do., May option, at $1 10; do., June option, at $1 10; No. 2 red, April option, at $1 .2½; do., May option, at $1 12½@1 12¾; do., June option, at $1 12½@1 13; No. 1 white, April option, at $1 09¾; do., May option, at $1 10½@1 10¾; do., June option, at $1 10¾. Rye at 57@58c. for Western, and 58@61½c. for State. Corn at for New York No. 2 at 44½c.; New York steamer mixed at 43½c.; No. 3 at 42½@42½c; ungraded Western mixed at 43½@44½c; New York No. 2 white at 46½c.; round yellow at 45½c.; New York steamer yellow at 43½@44½c.; New York No. 2 April at 44½c.; do., May at 41½c.; do., June at 45c.; steamer mixed, April, at 43½c; do., May, at 43½c.; do., June, at 43¾. Oats at for New York No. 2 at 31½c.; New York No. 3 at 31c.; white Western at 33½@34c.; mixed Western at 31c@31½c; white State at 35@36½c.; new York No. 1 white at 37c.; New York No. 2 white at 33½c; New York No. 3 white at 32½c.; New York extra white quoted at 38@39½c.; New York No. 1 quoted at 31½c; No. 2 Chicago quoted at 32c. asked afloat, and 30c. in store. Barley—no quotations for State. Canadian has sold at 95.c@$1; feeding barley, 40c.

HAY AND STRAW.—Offerings are full of most grades and buyers have the advantage, strictly prime stock alone excepted.

Sales at 40@45c. for shipping, and 70@75c. for retail qualities. Straw at 35@45c. for long rye, and 30@35c. for short rye, and oats at 35@45c.

Exports for week, 1,173 bales.

HOPS.—There has been less done this week, the shippers buying very sparingly, but prices are sustained.

Quotations are for New York's, new crop, choice, 9@12; New York's, new crop, medium, 7@8; New York s, new crop, low to fair, 5@6; Eastern, 6@9; Western, 6@9; Yearlings, 2@4; Olds, all growths, 1@ 2; Pacific coast, 8@12.

HONEY.—Retailers can name very popular prices with present wholesale figures, and there is some demand for local use. Clover comb, 8@10c.; buckwheat, 7@8c.; strained, 6@7c.

MAPLE SUGAR.—Supply moderate; demand good though somewhat restricted by several rainy days this week. Vermont small cakes, 11@12c.; State light, 10@11c.; dark, 8@9c.; old, 6@8c. Ohio has shipped little as yet. Sirup, 75c.@$1 ₩ gallon, in tins.

POULTRY AND GAME.—Couped fowls weaker with better shipping weather. Trade is good, as city killers have begun operations. Turkeys firm.

Spring chicks, 30c.@$1.25 ₩ pair; N. J. fowls, 14½c.; Western, 13@14½c.; Southern, 12@13c.; roosters, 7@8c. Turkeys, N. J., 16@17c.; Western, 15@16c. Ducks choice, 95c.@$1; other, 85@75c.; choice geese, $1.75@2; southern and Western, 75c.@$1.37. Pigeons, 35@40c.

Dressed poultry is scarce, hardly supplying more than first-class shop, hotel and steamer trade.

Frozen turkeys, choice to e, 24@25c.; fair good, 20 21@c; do. large, 23@25c. Dry-picked winter chickens, 35@40c. Spring, 5@65c.

Turkeys, best fresh killed, 19@22c.; the latter for Pa. dry-picked; other, 15@18c.; fowls, choice, 14@15c.; other, 11@13c.; capons 26@27c.; slips, 23@25c.; ducks, best, 20@22c.; other, 17@19c.

For game the market is generally lower. Stock must be in fine order to sell at all.

English snipe, $1@1.12 ₩ doz.; plover, $1@1.12; small snipe, 40@50c. Wild pigeons, $1.50@1.62; canvas backs, 90c.@$1; red head, 50@60c.; mallard, 40@50c.; black, 40@50c.; common, 15@25c. Season most over for wild ducks. Tame squabs, ₩ doz., $3.

PROVISIONS have declined sharply on the full stocks, closing active. Mess pork closed at $10 bid and $10 10 asked for new for April; May at $10 bid and $10 10 asked; June at $10 10 bid and $10 20 asked; and July at $10 15 bid and $10 30 asked. Bacon at $5 for long clear and 5 3-4c for short clear. Lard at $6 15 for spot lots; $6 10 for May; $6 15 for June; and $6 20@6 22½ for July. Stearine at 6¾@6¾c. for western. Tallow at 6¼@6¾c. for prime. Beef hams at $17 75@18. Beef—extra mess, $10@22, as to quality; packet, $11@11.50; plain mess, $9.75@10.50; extra mess at $10.50@11.50.

SEED.—Timothy is quiet at $1 30@1.35. Clover is in small demand; quoted at 6@6½c. for prime, and 6¼@ 6¾c. for choice Western.

VEGETABLES.—Exports potatoes for week, 308 bbls. Market strong. Southern stuff sells fairly; the weather has not given it a good chance yet. Early Rose and Eastern, $3 50@3 75; State, choice, at $2 75 @3 25; fair to good, $2 50@3; Peach Blow, white, in bulk, $3@3 50; red, $2 75@3 25; Prolific, $3; Peerless, State, $2 37@2 62; Jackson white, $2 50@2 75; Mercer, $2.25@2.37; (outside rate per double heads). Sweet potatoes, Md. & Del., $3 50@3 75. Onions, red and yellow, $2 75@3 50. Squash, marrow, $3 50@4 00. Cabbages per 100, $4@6; R. turnips, per bbl., $1@1.25; beets, 75c.@$1.00; carrots, $1@1 12. Horseradish per bbl., $5@7. Southern items—String beans, Fla., per bush., or., $3 00@3 25; green peas, Ch'n and Sav., small, $2 25@2 50. Ch'n and Sav., large, $2 00@2 25; Fla., ₩ bush. crate, $1 00@1 75; asparagus, Ch'n, ₩ doz. bunches, 75@9c.; kale, Norfolk, ₩ bbl., $1 75; Baltimore, ₩ bag, $1 25; spinach, Norfolk, per bbl., $3 00@3 50; Baltimore, ₩ bbl., $2 00@2 50; radishes, Norfolk, ₩ 100 bunches, 75c.@$1 25; cabbage, Sav., new, ₩ bbl., $3 00@3 50; onions, Bermuda, ₩ crate, $1 75@2 00; tomatoes, box $1 25@1 50, potatoes, $10@ 11. Hot-house rhubarb, ₩ 100 bunches, $4@5.; radishes, ₩ 100 bunches, $1@6; cucumbers, large, ₩ doz., $1 50@2 50; mushrooms, ₩ lb., 50c.; lettuce, selected, 37@75; ₩ doz.

TOBACCO.—No change has occurred in the market, prices essentially as last week, with a slack trade.

WOOL.—Demand has been very slow the past week, buyers holding off awaiting the marketing of the new Texas and California clips; prices are not changed.

Ohio, Pennsylvania and Virginia—XXX and picklock, 36@37½c.; XX, 33@35c.; X, 33@34c.; No. 1 33@ 35c.; No. 2, 32@33c; common, 29@30c.; combing, 36@ 38c.

New York, Michigan, Indiana and Wisconsin—XX, 30@32c.; X, 29@31c.; No. 1, 31@33c.; No. 2, 27@30c.; common, 26@28c.; combing and delaine, 33@37c.

Iowa, Vermont and Illinois—X and XX, 28@30c.; No. 1, 30@33c.; No. 2, 27@28c.; combing, 33@36c.

Missouri, Kentucky and Tennessee—Washed fleece, 30@33c.; unwashed fleece, 18@24c.; unwashed combing, 22@25c.

LIVE STOCK MARKETS.

BEEVES.—Receipts for the week, 8,084 head; do., last week, 9,125 do. There was a strong feeling in beef cattle, the close of Lent recalling considerable market demand. At the tho close there was considerable competition for upper grades of stock, and prices at the main pens were fully ½c. higher than on Wednesday. For London 245 choice steers were sold yesterday. Shipments for week ending Saturday April 19th, 5,172 quarters of beef, 517 live cattle, 1,380 carcases of mutton, 610 live sheep 135 dressed pigs. For the island of Bermuda, 90 head have were taken. Quotations: common to prime, 8¼@10¼c. ₩ lb., to dress 55@57 lbs. to the gross cwt.; 2 car-loads of still-fed bulls, at 4@4½c. ₩ lb., live-weight; plain but fat Colorado and Montana stillers at 9¼@10¼c., to dress 56@57 lbs., mainly at 10@10¼c. Yards were cleared at an early hour.

COWS AND CALVES.—Sales do not exceed $30@50; a cow worth more here would do as well at home.

VEAL CALVES.—Market quiet for live with the usual liberal spring supplies. Prices weak. Receipts of country-dressed begin to fall off. N. J. and Buck's Co., 5@5¾c.; good do. and best State, 4¾c.; other grades, 3@4½c. Hog-dressed best, 6½@7½c.; fair to prime, 5¾@6c.; common, 3½@5c.

SHEEP AND LAMBS.—Receipts for the week, 20,145 head; do last week, 16,107 do. The market is steady and rather firm in anticipation of moderate receipts. Transactions include pour to prime unshorn sheep at 4¾@6½c. per lb.; ordinary to choice clipped do., at 4¾@5¾c.; and ordinary to extra yearling lambs (unshorn) at 6¼ 7c. About 201 fat sheep, 116 lb. average, were taken for export (dressed) at 6½c.

LAMBS, choice, $5 50 per head; fair, $3 50@4 50; poor, $2@3.

SWINE.—Receipts for week, 30,964 head; do. last week, 24,568 do. The range is nominally $3 60@4 10 per 100 lbs.; fair to good hogs have sold at 3¾@4c.

Country dressed pork light, 6@6¾c.; medium, 5¾@ 6c.; heavy, 5¾@5¾c.; city, 5@5¾c. Pork tenderloins 7c; lower and not wanted.

Also manufacturers of Premium Thresher. ☞ Send for Descriptive Circular. Wm. L. Boyer & Bro. 2101 Germantown Av., Philadelphia, Pa.

ECONOMY.
THAT CHALLENGE AGAIN

Where is that man Dederick now? His objections against the Economy, when first introduced, was its structure as a Hay Press, unfit for use; its work entirely unfit for market, &c., and for nearly a year the Economy was so denounced by him. Next he calls it infringing on his patents; nobody should buy it; everybody buying it would be prosecuted; had prosecuted and compromised with some parties, and all others should do likewise, and his blackmailing against the Economy has advanced to such a degree that he could no longer face it himself, and thus appoints tools to keep it up for him, and he retires; and disappoints everybody interested in that hay press and pressing controversy, which was fairly accepted by me with $500 00 to the winner. Should he doubt my word and responsibility for the amount due to the successful one in the contest, he may name and put up the amount satisfactory to himself, and I will match it with the same amount, at any bank in this State that he may select. Hope he will answer for himself, and face the Economy as proposed by him in STOCK JOURNAL of November last. The suit now pending in the U. S. Court at Indianapolis, Ind., by which the right and ownership to the Perpetual is questioned, may likely soon (in this case) change the minds of many. The Economy, the leading Hay Press,—the Press for all—will be ready to meet that challenge whenever called for, and is warranted to be and to do as claimed or the money refunded. 129 of them now in use. Send for descriptive Circulars. GEO. ERTEL,
Patentee and Manufacturer, Quincy, Ill.

BOOKWALTER ENGINE

HORSFORD'S Bread Preparation
UNSURPASSED FOR MAKING
LIGHT BREAD,
Biscuit, Rolls, Cake and Pastry.
It is Better and Healthier than ordinary Baking Powder, Cream Tartar or Yeast.
The cost of raising Bread, Biscuit, &c., with it is only about half as much as by ordinary Baking Powder, and the result is much better.
It restores the nutritious elements which are taken from the flour in bolting. No ordinary Baking Powder or anything else used for raising bread does this.
Universally used and recommended by prominent Physicians.
If you cannot get it of your Grocer send a three-cent stamp to the manufacturers for a sample.
Manufactured according to the directions of Prof E. N. Horsford, by the Rumford Chemical Works Providence R. I.

Reading for the Young.

TO THE SONS OF THE FARMER.—No. 6.

REV. A. W. MANGUM.

KNOWING the effects of certain unfortunate impressions and opinions, as to the choice of an occupation, I consider it advisable to give you additional admonition on that subject. First, you may have inclination to some work for which you have the requisite natural talent, but for which you may think your circumstances render it impossible for you to prepare. If such be your case, you are in an important crisis of your life. You ought not to be presumptuous, and you ought not to be faint-hearted and irresolute. It is true that, with many, the obstacles in the preferred way often appear virtually insurmountable; at least, for a considerable time, a most hazardous venture. But the history of the past is crowded with examples of the power of talent, industry, resolution and perseverance to conquer all ordinary difficulties. A penniless boy with these qualities will, in case of his fidelity, certainly outstrip the wealthy boy who has money, and money only to help him in life. If education is necessary to the accomplishment of what you wish, you can get education; provided you are willing to practice self-denial for a season and make extraordinary efforts. Of the two gentlemen who to-day represent my State in the Senate of the United States, one obtained an education through the indulgent liberality of friends; and the other (probably the abler of the two) had no scholastic facilities but six months in a common school in the mountains. He read and studied, and educated himself; and to-day he is in the front rank of the highest legislature in our great country. I might fill not pages, merely, but *volumes*, with the names and careers of those who have literally *made* the means that enabled them to be educated; or, by assiduous exertion, achieved all the advantages of learning without the aid of schools. What so many have done, you certainly may reasonably hope to do, if you are willing to make such sacrifices and efforts as they made. It is grand, yes, grand even to sublimity, for a young man to throw aside all the embarrassments of self-indulgence, and bravely, proudly grapple with frowning misfortune—never yielding till the laurel of triumph, trembling in the admiring shouts of thousands, crowns his chivalrous brow.

What is thus shown as to general education, is equally applicable to the special training required for the successful prosecution of any of the arts, sciences, or professions.

But, secondly, your talents and circumstances may plainly point you to some industrial pursuit, to which you may have unjustifiable objections. That pursuit may involve manual labor; and there is an old and foolish prejudice against living "by the sweat of the brow." Is manual labor less respectable than intellectual? What is the former but the utilization of the latter? What is theory worth, unless it is reduced to practice? What can thinking accomplish, if it is not carried out in working? Only consider that agriculturists and mechanics on the one hand, and the book-makers and brain-workers on the other, are clearly interdependent. The most learned men in every department study, in proportion to their wisdom, to subserve the interests of the vast laboring masses. These laborers ply their plain but arduous task that they may have the necessities and comforts of life for themselves, and also furnish them to the multitudes of non-producers or (in the restricted sense) non-laborers in the world. Of the two great classes, the laborers are really the most independent. A man can make bread without books; but he cannot make books without bread. A man can be a successful mechanic without the learning of the philosopher; but the philosopher can not boast of usefulness and distinction without the aid of the mechanic. The scholar in his study has wrought out incalculable benefit for the toilers in field and workshop; but those toilers have been producing those things which were absolutely indispensable to the very existence, not to say success, of the scholar. The humble laborers, then, are the real masters. They are not only the necessary agents of all progress, but are the veritable life-preservers of all society. They are not only worthy of the respect due to the useful, but are to be gratefully revered as the grand almoners who dispense the help without which the very race of mankind would perish.

Then, let the intelligent youth blush to think that he was ever ashamed of being known as a follower of any industrial occupation! The most independent people in America are the faithful, intelligent, and, consequently, successful farmers.

Of course you are not to conclude that, because you are engaged in industrial work, you will have no need of mental culture. For many reasons you should train your mind to strength, and store it with varied and useful learning. The better your education, the more success you may expect in your work. Your hands must be directed by your mind. The management of a farm or factory requires the effective exercise of the same mental faculties that enable men to be great in public and professional enterprises. Patient and minute observation, accurate memory, inventive imagination, facility in combining and classifying, sound judgment, ability to reason promptly and clearly, self-control, and a strong resolution, are all of as much importance, relatively, to one occupation as another; if the person engaged in that occupation pursues it to the best advantage and with the purpose to go forward and rise higher. To make a plow or run a furrow, to build a wheel or plant corn, to make a horse-shoe or drive a wagon, involves the exercise of the powers that are developed by the study of high branches of mathematics, and are really the practical application of essential principles in geometry. Everything that pertains to farming has some important connection with the several departments of natural history. The buying and selling which attend the life of a farmer or mechanic, make it desirable to know as much as practicable about the laws and principles governing trade, the bearing of public regulations upon individual rights and interests, and, indeed, everything that can help to correct mistakes, avoid troubles and losses, and improve, to the best advantage, all the means and opportunities at command. Education will, likewise, furnish you with an unfailing source of enjoyment. Knowledge is pleasure as well as power. With an active, strong, well-furnished mind, you will always have present with you the means of self-entertainment. It will render you a far more agreeable and helpful companion, at home or abroad. It will qualify you to secure for yourself, or impart to others, innumerable and invaluable pleasures, that otherwise could not be enjoyed.

Furthermore, education will bear you up, probably, to more public work. The sad destitution of sound, practical knowledge, in those who govern the vast and varied interests of our country, is a potent cause of the financial troubles which afflict us. We need wise, practical men in high places. Educated theorists, merely, are not as well fitted to legislate for our population, as are those who have the knowledge that books give and, also, the knowledge that nothing in the world but practical experience can impart. You may be needed in positions that demand better legislature for the protection and promotion of the work of production and utilization. For these and other reasons that I might mention, you ought to make great exertion, great sacrifices, if necessary, to obtain a liberal education. You may have an aversion to your proper occupation because, while it involves much hard work and self-denial, it may give promise of only small and slow profits. As to this, I must admonish you, to remember that every person is liable to set an extravagant estimate upon money. I do not deny its importance, or teach that you should not make it a factor in your calculation about your life work. But do not give it more importance than it relatively deserves. Certainly it is not to be sought and prized as an *end*; but only as a *means*. The Dutchman's advice to his son, on the subject of matrimony suggests the true theory. Said he, "My son, do not marry *for* money; but do not marry *without* it." I say to you. Do not choose an occupation because of the money it will enable you to accumulate; but do not make a choice that will probably result in your failing to obtain the means to meet your reasonable wants and to accomplish reasonable hopes of usefulness. A calling should not be followed for money as the object; but money should be sought that, while it meets consistent demands as to our general well-being, it may be made auxiliary to the grand, supreme aim that challenges our main devotion. A man, with little means, engaged in his proper work, will be happier and more successful, than he, who, with large posessions, is where he ought not to be, attempting what he cannot do, or doing what should never be done.

But a just comparison of industrial and strictly professional occupations, will show, probably, that the objection to the former which we are now considering is not well-founded. That must be deferred to the next number in this series.

THE HORTICULTURAL CLUB.

To those members of the Club who received the prizes, I wish to say, that although I promised nothing but flower seeds, on second thought I concluded that it would be too many varieties for so small a garden particularly, as in all probability some flower seed had already been provided from other sources. I therefore substituted a few choice varieties of vegetable seed, hoping thereby to serve their interests better.

The Hollyhock seeds are selected from plants of Chater's strain, and each seed will make a plant bearing different-colored flowers, all as double as possible. The Balsam was imported from F. & A. Smith, of England, six years ago. Old seed of Balsam is supposed to be best—the older, the more double. Smith's prize Balsam is the best strain of Balsam known at present. Each of the six seeds will produce a different-colored flower. I should like to receive a report from each prize taker of the success or failure met with in the cultivation of these plants.

I wish to call the attention of the members of the Club, and indeed of all the cousins, to a bulb very desirable for their gardens; it is the Tuberose. The only objection to this lovely flower is that it is tender, but it fully repays all extra care and trouble expended upon it. It sends up a stem about three feet in hight, bearing twenty or more beautiful pure white, wax-like and very sweet-scented double flowers. In southern latitudes the bulbs may be set in the open ground in the beginning of May; but those who live in the North should plant their bulbs in boxes now, and set them in the hottest part of the house till the beginning of June, when they may be planted in the open ground; they will then bloom in the fall. None but the large bulbs will flower. The small ones should be set in rows on a nursery bed, tended carefully all summer, taken up in the fall and kept in a warm place during the winter; they will then be ready to bloom next summer. UNCLE MARK.

BLOSSOMING TREES.

ESSAY BY E. P. POWELL.

IN planting for pleasure trees may not be chosen for foliage only, but for their blossoms. Superb groups may be established of trees whose fragrance will fill the air for an eighth of a mile. (1.) The Magnolia (the Glauca, a shrubby variety is especially showy and sweet) (2) The Linden, hardly any tree surpasses this for exquisite odors wafted about especially at dew time. The bees appreciate its delightful sweetness and make a grove of it as profitable as it is charming. (3.) The Locust, for some reason this tree has lost its popularity. But there is nothing to equal its pure and showy tufts of racemes, its wealth of floral display. The Locust is peculiarly adapted to a new place, growing as much in five years as any other in ten. (4) The Scarlet Maple. I should not overlook the beauty of this variety of maple, which is both noble in foliage and very bright in its early blossoms. (5) The Tulip Tree. In many of the States this tree succeeds admirably, where it is not indigenous. If a tulip mania was excusable the tulip tree might well set a nation wild with its glory. (6). The Cornus Florida. This is a small tree but adapted to a wide range of territory. I have seen it grown in Michigan as a street tree. (7) The Catalpa. In New York City and in St. Louis the Catalpa does well for shade, while its clusters of bloom are universally admired. It is somewhat tender in the Northern States if planted where the winter winds work upon it. (8) The Cherry. There is no tree that combines the advantages of fruit bearing with beauty of form suitable for a lawn like the cherry. In blossom it is as lovely as tree can be, and in fruit is a living poem.

This list can be enlarged, but it furnishes a sufficient variety for any small lawn.

Cutlings.

(1). Select new growth, but not too succulent and feeble shoots. (2). Cut smooth under a joint so as to leave it about three or four inches long. (3). Strip off nearly all leaves and cut off the tip. Especially remove blossom buds. (4). Plunge it into the soil about one and a half or two inches; pressing the soil hard down about the cutting. (5). Let the soil be thoroughly wetted one-half hour before using, but not sticky at the time of inserting the slips. (6). For Geraniums do not water the soil again for a week or two, but set the box where it will not become dry. Fuchsias, Achyranthus and some others do best in sand. Roses will root most readily in a hot-bed or cold-frame. (7). Label carefully as you strike the cuttings, and thus save trouble and confusion. (8). Pot off soon after the plants begin to grow; always selecting very small pots.

These hints will help many a puzzled housekeeper who does not know how to propagate and multiply her plants.

LETTERS FROM BOYS AND GIRLS.

DEAR UNCLE AND COUSINS.—I have been amused and interested in reading the many letters written by the cousins and Uncle Mark. I have often thought I would like to become a correspondent to the RURAL. We have taken the RURAL since I can remember, and I always look forward to its coming with great delight. Perhaps some of the cousins would like to know what kind of weather it is here in Canada, where I reside. There is quite a lot of snow here yet, and we are all longing for its departure. The most of the farmers are starting to make sugar. That is the pleasantest time of the year, and a time that we young folks enjoy to our heart's content. I suppose that most of the cousins that write to the RURAL know all about sugar-making, and if they don't I will recommend them to look in the RURAL of the 22d of March. They will there find a description of the business that is worth any of the cousin's while to read. I would like very much to be where there is 1,000 trees in one camp. But it is not right to be discontented with one's lot. Our mode of farming in Canada is quite different from what it is in many of the United States. We farm two hundred acres of land, and keep a large number of cattle, rather too many to give their names. I noticed in one of the cousin's letters that he had some canaries. We have four, and it is delightful to hear them sing. If the cousins who have no canaries would get at least one bird they would be highly pleased. They are among the nicest of pets. I have started to learn to play the organ and find that it not half so easy as I thought it was. I am almost discouraged, and sometimes feel like giving it up, but nothing worth having can be obtained without effort. I will, therefore persevere. But I have written enough for my first letter. If it is worthy of a place in the RURAL I will write again and tell you more about the farm and my garden, so no more this time. WIDE-AWAKE.

Fountain Head Farm, Canada.

DEAR UNCLE MARK:—I would like to join your Horticultural Club. I am thirteen years old, but never worked in the garden very much, so I don't know much about it, but I like flowers very much, and intend to plant some next summer. We have a south window in the sitting room, which ma keeps filled with flowers in the winter. She has ten different kinds now, and all but one are in blossom. Her Calla lily measures 49 inches from the tip end of the blossom to the pot in which it stands. The Petunia and the Fuchsia are about as high, and full of blossoms. Besides these, she has in bloom Oleander, Lantana, Cineraria, Heliotrope, Pink and Chinese Primrose. The Camellia isn't in bloom now. I helped set out a Strawberry bed last fall; a friend gave my sister the plants. They are "Monarch of the West." It was dry weather when we set them out, so we dug little holes and filled them with water, put the plants in, and pressed the earth around them with our hands. The bed is on the side of a hill, or rather at the foot of it. The ground is rich. There were in all three hundred and fifty plants. We had to put the bed away from the house, so the chickens and turkeys would not bother it. My brother has a turkey that weighs 35 pounds; it is but nine months old, and when it gets its growth he thinks it will weigh 45 pounds. I suppose I cannot expect to write a prize essay the first time, but if you are pleased with my letter, may be I will write again.

Johnsons, Orange Co., N. Y. BERTHA H.

DEAR UNCLE TRUE AND COUSINS:—As Uncle Mark has proposed to give the cousins a chance to join his Horticultural Club, I hope we may have a good many interesting letters on that subject. We have planted peas and radishes in our garden, but the snow is now six inches deep (April 3d), and the thermometer is eight deg. above zero. On March 26th, we put our flower seeds in the hot-bed, and on the 20th our vegetable seeds, which are now up. My brother and I can do considerable in the garden, and we like to work in it very much. Our grandpa gives us a piece of land every year and lets us take care of it. I noticed another letter from our Swiss cousin. I can furnish you with some more of your fancy pets, in the summer, if you wish them, John, but don't know as they would be profitable pets if you have to bury a suit of clothes every time you caress them. I have a few bulbs of Gladiolus which I would like to exchange for those of the Amaryllis. If any of the cousins would like to exchange and will send to box 1968 with their address, I will send them mine as soon as possible. BOB WHITE.

Rockford, Winnebago Co., Ill.

Sabbath Reading.

RISE, for the day is passing,
And you lie dreaming on;
The others have buckled their armor,
And forth to the fight are gone.
A place in the ranks awaits you,
Each man has some part to play;
The Past and the Future are looking
In the face of the stern To-day.

THE FIFTY-FIRST PSALM.

SINCE the publication of "Gray's Elegy," the fifty-first Psalm of David has been translated into all the languages of the civilized world. New versions of it, in the English, French and German tongues, have been multiplied beyond former precedent. So soon as the language of a pagan tribe has been reduced to writing, it has been made the vehicle for carrying this Psalm to the Pagan mind. When the "Elegy" is translated, it parts with many of its original beauties; but this Psalm retains its glow and power when it is transferred to even the rudest language of the rudest men. It is the favorite Psalm of slaves and freemen, the poor and the rich, the ignorant and the learned. Some of the most beautiful passages in modern literature have been suggested by it, some of the choicest hymns in our devotional poetry are grounded on it. Its words have been repeated by men as they were dying on the battle-field, in prisons, on the scaffold, and also by the kings of the earth as they were breathing out their life in their palaces, and by the ministers of religion as they were bidding farewell to their churches. It was the sacred poem of the Jews; it has been the still more sacred poem of the Christians; it promises to be more and more the fresh utterance of good men in all tribes and all times.

In what manner, now, had David been educated for composing—and he had no leisure for spending eight years in composing—the Psalm which was to touch the sensibilities of the race? We first hear of him as pursuing the occupation ordinarily assigned to "females or to slaves, or to the despised of the family." He is represented to us as carrying around his neck a scrip or a wallet. We read of him as in a conflict with the lion and the bear, as fighting with the giant, as a busy warrior; a fugitive and outlaw, a statesman, a king. He lived in a dark and barbarous age—not only without the aid of universities and libraries, but without the stimulus of literary companions or a refined public sentiment. Still the poem he indited will live, when the poem written by a master of the sciences and of the arts will have been forgotten, and the Psalm will speak to the heart of millions, while the beautiful "Elegy" will be speaking to a select few, and the Psalm will be the more highly prized, as the sentiment of man becomes the more choice and pure.

On what theory shall we explain this difference between the ancient and the modern poem? Various theories have been invented, but that one which most easily explains the disparity is that the modern poet wrote under the impulse of his own genius, and under the influences of his multifarious learning; but the ancient poet was elevated above his own ingenuity by communion with the Divine mind and his powers were spiritualized by the inspiration of God more than they could have been by the largest human erudition.—*Prof. Park.*

FAITH, Hope, and Love were questioned what they thought,
Of future glory, which religion taught.
Now Faith *believed* it, firmly, to be true;
And Hope *expected* so to find it too;
But Love replied, with smiling, conscious glow,
Believe? Expect? I *know* it to be so
T'is heaven wherever Jesus doth abide;
And where He is, I shall be at His side!

FAIR-WEATHER CHRISTIANS.

DISAGREEABLE Sundays sift churches as honestly as the test of "lapping water" sifted the ten thousand troops under Gideon. Those who really want to get to God's house on a wet or wintry Sabbath usually do get there. The richest spiritual blessings are often obtained by those who submit to some hardship in order to do their duty. And what a melancholy spectacle to the eye of our loving Lord must be the sight of His own sanctuary on disagreeable days; and of His own "upper rooms" of communion when His disciples have turned their backs upon Him! For one, I honestly confess that all the trash of the skeptics, from Renan or Huxley down to Ingersoll, do not inspire such misgivings of Christianity as a heart-power as are awakened by the spectacle of delinquent Christians in unfavorable weather. Next to that is the sight of a contribution-box after it has gone the rounds of a congregation who live in "ceiled houses" and keep their own carriages.—*T. L. Cuyler.*

BEGIN all thine actions with prayer, that thou mayest be able to accomplish them.—*Pythagoras.*

PERSONAL ITEMS.

Garibaldi is down sick in Rome, and it is said that he has gone there to die.

Senator Bruce will shortly issue a letter to his colored constituents, advising them not to emigrate to the West.

Use Hop Bitters once and you will use no other medicine. Test it.

Implements and Machinery.

COOLEY CREAMER

Supersedes large and small pans for setting milk.
It requires no milk room. It requires capacity for one milking only.
Impure air, dust or flies cannot reach milk set in it.
It makes more butter, because it raises all of the cream, and the quantity is never lessened by unfavorable weather.
It makes better butter. It requires less labor. It is cheaper.
Butter made by this process took the HIGHEST AWARD at the INTERNATIONAL DAIRY FAIR—and brings the highest price in all the great markets.
Send stamp for the DAIRYMAN to
Vermont Farm Machine Co.,
Bellows Falls, Vt.

A. P. Dickey Fanning Mill.

The Best Fanning Mill in the World. Obtained Centennial Award and Grand Medal. It cleans perfectly Oats, Chess, Cockle and all foul matter from Wheat and Barley. It grades and separates for Seeding and Market, cleans all kinds of small seeds, and will save any farmer its cost annually. Agencies will be established throughout the Middle States this season. Address

Serious Danger

Threatens every man, woman and child living in a region of country where fever and ague is prevalent, since the germs of malarial disease are inhaled from the air and are swallowed from the water of such a region. Medicinal safeguard is absolutely necessary to nullify this danger. As a means of fortifying and acclimating the system so as to be able to resist the malarial poison, Hostetter's Stomach Bitters is incomparably the best and the most popular. Irregularities of the stomach, liver and bowels encourage malaria; but these are speedily rectified by the Bitters. The functions of digestion and secretion are assisted by its use, and a vigorous as well as regular condition of the system promoted by it. Constitution and phisique are thus defended against the inroads of malaria by this matchless preventive, which is also a certain and thorough remedy in the worst cases of intermittent and remittent fevers.

Breeders of Fine Dairy Stock

Should at once investigate the PERFECT CREAMER advertised in another column. It will enable them to realize the largest possible yield per cow, and thus enhance the value of their stock as well as increase *the value* of the product.

Makers of Gilt-Edge Butter

Or those that desire to become such should use THE PERFECT CREAMER, advertised in another column. Butter made by its use, is always rated Gilt Edge, and commands ready sale and an extra price.

Lord & Taylor

Ladies' and Misses' Suits.

OUR Spring and Summer assortments of suits, comprise the following desirable garments, at the very reasonable prices below quoted:

Fancy Bouclette and Serge Suits	$8.00
Summer Camel's Hair Suits, skirts trimmed with Corduroy	11.50
Ladies' Cloth Suits, in gray and *ecru*	12.50
Combination Suits	13.50
Debege, trimmed with stripe and brocade combinations	15.00
New Summer materials, trimmed with Silk	19.00
Striped Camel's Hair, trimmed with striped goods	25.00
Mamie Cloth and bunting combination	23.00
Fancy Camel's Hair Suit, silk skirt	30.00
Black Silk Walking Suit	28.00
Fancy Silk Walking Suit	22.00
Plain Silk, trimmed with brocade	38.00
White Swiss Suits	6.00
Cambric Suits, from	2.50
Organdie Suits, from	16.00

Wrappers.

Calico Wrappers, Spanish flounce	75c.
Tycoon Reps Wrappers	$1.80
Fancy Flannel Wrappers	2.95
Cashmere Wrappers	4.85
White Lawn Wrappers	3.00
White Lawn Wrappers, trimmed with lace	4.00

Misses' Suits.

In Cambric, from	50c.
In Pique, from	$1.50
In Plaid, kilt skirts, from	5.00
In White Swiss, from	4.50

These Suits are all of this season's materials well-made, tastily trimmed, and will bear the closest examination.

Cloaks and Wraps.

CUT-AWAY JACKETS AND WRAPS, IN LIGHT-COLORED CLOTHS; WRAPS IN CAMEL'S HAIR CLOTHS, WOOL SILICIENNES, DIAGONALS, &c., IN ALL THE BEST SHAPES FOR EARLY SPRING WEAR, SILK GARMENTS IN DOLMAN AND MANTLE SHAPES;

ALSO,

ULSTERS IN CLOTH, FOR LADIES AND MISSES IN SPLENDID VARIETY. SACQUES FOR CHILDREN FROM 3 YEARS, IN ALL THE NEW MATERIALS. PRICES IN THIS DEPARTMENT ARE EXCEEDINGLY REASONABLE, AND MUCH LOWER THAN FORMER SEASONS.

☞ SAMPLES OF PIECE GOODS, WITH PRICES DISTINCTLY MARKED, SENT ON APPLICATION TO ANY PART OF THE COUNTRY, SPECIAL ATTENTION TO ORDERS BY MAIL.

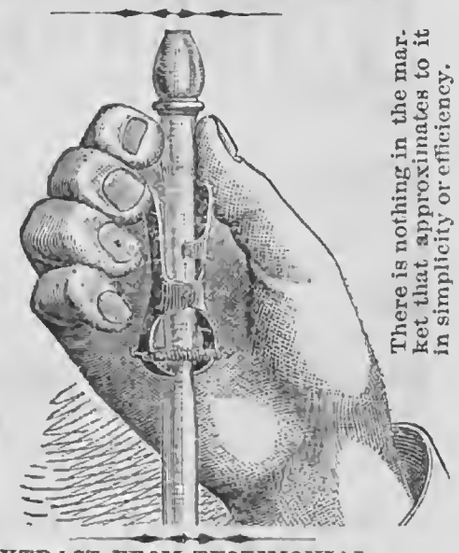
Phelps' Nasal Douche

for administering the

NORWEGIAN BALM

FOR

CATARRH



Pressing upon the wings of the check-spring, opens its mouth, which allows the dilution to flow, and when the pressure is taken off, the flow immediately stops.

There is nothing in the market that approximates to it in simplicity or efficiency.

EXTRACT FROM TESTIMONIAL.

903 Eight Ave., New York, Dec. 17, 1878.

I think your remedy for Catarrh "One of the greatest discoveries of the age." Before using the NORWEGIAN BALM my wife *suffered untold misery for years.* We sought medical aid, far and near, but to no effect. Our regular Physician, distinguished for his knowledge, skill and honesty, pronounced the disease incurable; that it would extend from the nasal organs to the throat and bronchial tubes, and finally to the lungs,—and that death would be the result at no distant day. This was well nigh the case. But in your NORWEGIAN BALM *she found immediate relief;* the extremely offensive odor of her breath, from which she had suffered so many years *entirely disappeared within two weeks* after she commenced to use the BALM. After having used only one bottle, if not fully cured, she feels well on the way. C. C. SULLIVAN,
Produce and Commission Merchant,
155 Chambers Street, New York.

Quart Bottle, $1.00, (*sufficient for Two Months' use.*) Trial Bottle, Twenty-five Cents.

THE CULTURE OF TOBACCO IN THE NORTH.—No. 1.

G. A. GOFF, JR.

TOBACCO-GROWING has been slowly but steadily increasing in favor among farmers in the Chemung valley during the last twenty years. Its culture has proved profitable and it is coming to be among the leading products of our farms. Much has been said and written against its cultivation and use, but the demand for it continues to increase, and our country is receiving more than $30,000,000 annually for leaf and manufactured tobacco, from foreign lands, besides a large internal revenue.

Tobacco is an exacting crop, and success in producing it profitably depends, in a great measure, upon the diligence and thoroughness of the grower, as a little negligence will sometimes cause much loss. The best soil for tobacco is considered by growers in this valley to be river or creek bottom lands consisting of a sandy or clay loam, though good uplands where clay does not prevail, may be made to produce a good leaf. If the soil is not rich, it must be made so by an application of some kind of manure. Barnyard manure is considered the best, though commercial fertilizers are used in some soils with good results. In this latitude it requires about five months for the tobacco plant to make its growth. One-half of this time the plants remain in the seed-bed, during which time they require much care and attention. If a tobacco-grower has a bed of good, strong, healthy plants, enough to set his entire patch, and large enough to be set by the first part of June, he may consider his crop about half raised. A failure in producing plants must necessarily cause loss, as growers are not willing to part with plants until they have made their own settings, and then it is often too late.

For producing the plants, the ordinary cold-frame used by gardeners is employed. It consists of a low box or frame covered with glass. The bed should be prepared in the fall by an application of fine manure, and thrown into a ridge to hasten drying in the spring. Early in the spring, the glass is placed on the frame to exclude sun and rain, that the bed may the sooner become in condition to "work." The soil in the bed is made rich and mellow with muck or well-rotted manure and the use of the hand-rake. A few days before sowing, the seed is mixed with fine muck or sand, and placed by the stove till sprouted. One-third of a pint of seed mixed with four quarts of muck or sand, will sow two hundred square feet of bed and, with good success, will furnish enough plants to set three acres. Much care is required to keep the bed moist while the plants are young and tender. In warm weather the bed will require daily watering, and for the first week or so it is better to use tepid water. When the sun shines hot, the glass must be raised to prevent the plants from burning. If the plants are late, they may be forced by sprinkling them with manure water, or liquid manure.

The task of weeding begins as soon as the weeds are large enough to pull, and must be continued as long as they appear. The glass on the bed may be dispensed with entirely after the plants get well started and the nights become warm. The plants should be large enough to be set by the first part of June, and plants of the best size are those having leaves about two inches long. While the plants are growing, the ground where they are to be set should be prepared to receive them. The soil is usually plowed twice, once in the fall and again in the spring just before setting time.

Chemung Co., N. Y.

Rural Architecture.

A FARM DAIRY BARN.

AFTER the dwelling-house, the most important convenience on the farm is a good barn. Indeed in some parts of the country, notably among the Pennsylvania Dutch and along the Shenandoah Valley, the barns are far more pretentious and costly structures than the dwelling-houses. In view, therefore, of their utility, the amount of money often expended on them and the length of time they last, it is very desirable that they should be well constructed on a good plan at the outset. Hence we have of late thought it to the interest of our readers to devote a considerable amount of our—of their—space to the topic of barn-building, and now place before them a representation in detail of a convenient farm dairy barn.

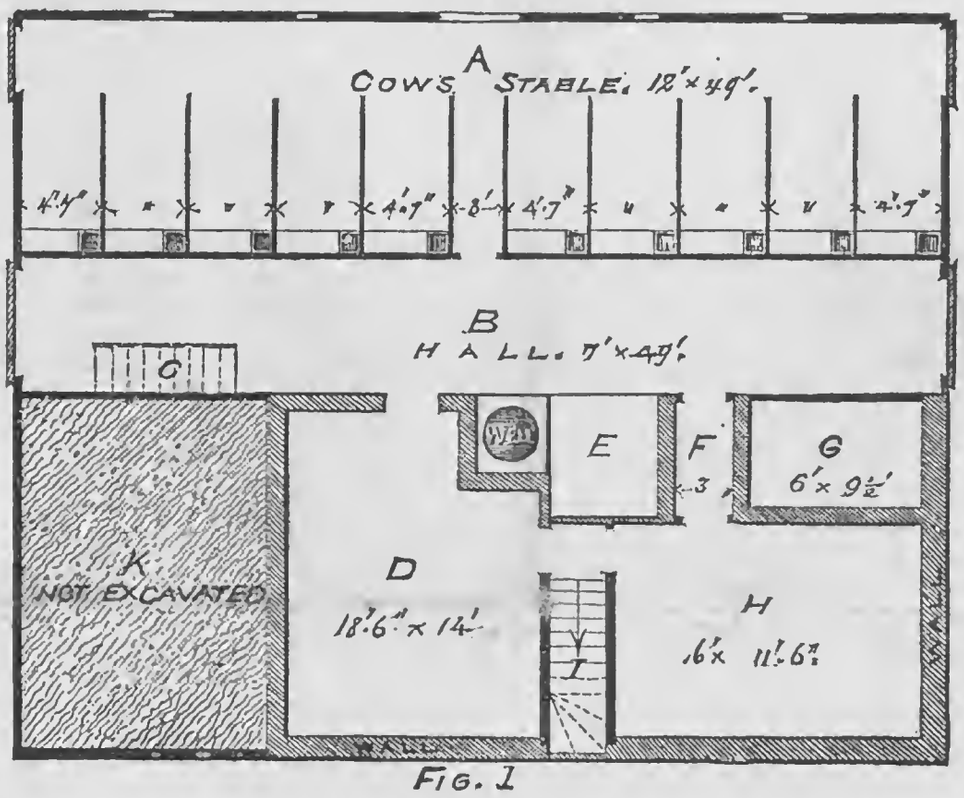

FIG. 1

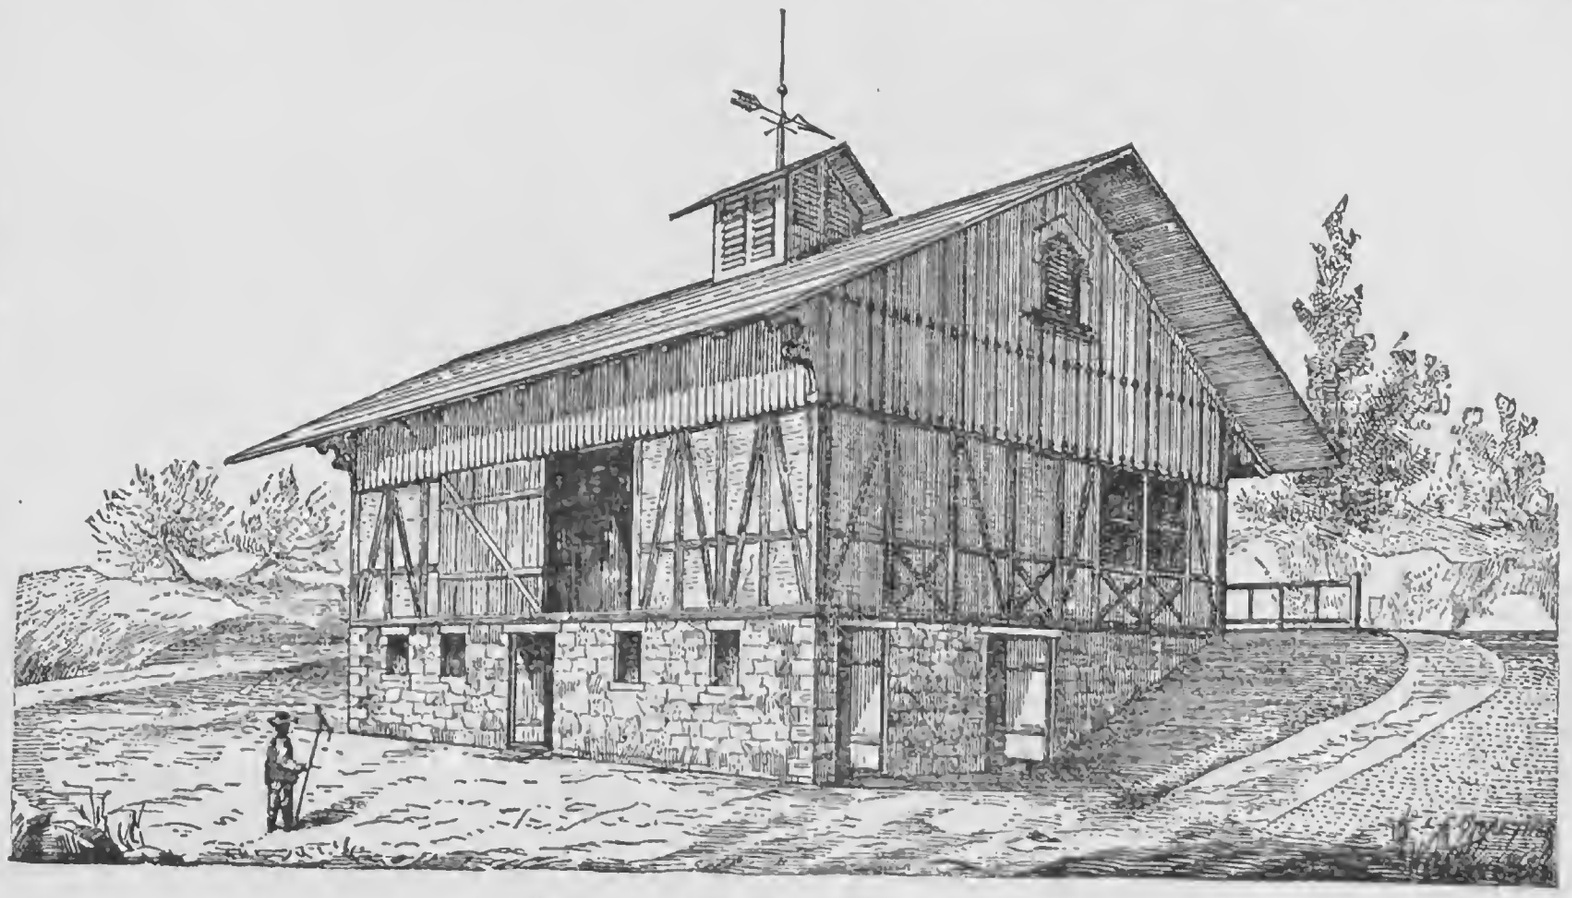
PLAN OF FIRST FLOOR.

The elevation shows a side and end view of the building which is 40x50 feet. The basement story is eight feet high in the clear; the upper story, sixteen feet from sill to plate. The sketch shows the material and method of construction so plainly that a lengthy verbal description is unnecessary.

Fig. 1, is the ground-plan. A, is the cow stable affording room for ten cows. B, is the hall-way, wide enough to drive a wagon through on removing the movable stairs at C. D and H are frost-proof root and feed cellars; the latter is also designed to contain a root-cutting machine. E is the landing for hay and cut feed from above, and next to it is a well from which the stock can be supplied with water. F is a passage three feet wide, and G a bin or box for mixing feed. At I is the stairway leading to the floor above, see Fig. 2 page 279. On this floor A, B, C, and D, are grain bins. E is the harness room, and F the stairway to basement. G is the horse stable, the entrance to which is on the back side of the barn. H is the spacious barn-floor, and I, I, bays for the storing of hay, straw, etc., while K is a cutting room and L a shoot for passing feed to the basement. The dimensions of each part are marked thereon, and the clearness of the pictured plan obviates the necessity of further description. The building, the plan of which is here given, stands on the farm of C. E. Ross, Hamer, Paulding Co., Ohio.



FARM DAIRY BARN.—Elevation.

Horticultural.

HARDINESS OF RASPBERRIES.

E. P. ROE.

I WAS interested in your paragraph on the hardiness of the "Pride of the Hudson," and of Raspberries in general. I would like to give you the history of my Raspberry in respect to its endurance of frost. For three years, in the garden at Newburgh, where it originated, it never received the slightest protection, and during the winter of '75-6 the mercury sank to 25 degrees below zero on one occasion. In the fall of '75, preceding this same severe winter, I removed a number of canes to my place at Cornwall, and left some standing, from three to six feet high, as I particularly wished to test this question of hardiness. I naturally thought that if the variety was weak in this respect, canes that had been moved and set out just before winter, would show it. They were planted, also, on top of a hill and in an exposed place. Not a bud was killed, and both on my place and in its original home, they were alive to the tip. In May, '76, I put out quite a number of pot-grown plants that had been started in a greenhouse, and they averaged three feet of growth by fall; and these young plants, and those remaining in the variety's original home, were not injured at all in the winter of '76-7.

In the mild winter of '77-8, there was a change in this respect. That I did not wait for any one else to discover and state this fact, is proved by the marked passages taken from my catalogue, sent out in September '78, by the thousand. As *soon* as my Raspberry developed faults, I stated them plainly, and in advance of any one else. Its good qualities never rested on loud praise from myself, for I invited the most *experienced* fruit growers in the country to see it, and give *their disinterested opinions*. From first to last, I have told the public all that I knew about it, and think I should be given credit for this candor. The Pride of the Hudson has been injured again during the past winter, but scarcely more than the Brandywine growing near it. I think it will be found that the Pride of the Hudson will flourish wherever the Franconia thrives, and under the same treatment, and that its beauty, size and delicious flavor, will always give it pre-eminence for the home garden. The fact that it surpassed everything at Boston last summer, and received the first prize from the Mass. Horticultural Society, is something that cannot be explained away.

I now ask with you; "Is there any hardy red Raspberry?" I know that even the Turner has been killed in this region during the past winter, and the "*Cuthbert*," which for years has been tested in the East and West, the light sand of New Jersey, and the heavy soil of our region, and was thought to be "iron-clad," has been found injured in two instances to my knowledge this spring. I am, perhaps, at present more interested in this Raspberry pecuniarily than all other parties put together, for I have invested in it largely, and yet I candidly state this fact, in accordance with my rule to give the *faults* as well as the good qualities of fruits, as fast as I learn them. And I shall show no more favor to my own pets than to other people's. Never before have I heard of the Cuthbert receiving the slightest injury. For several years and in widely separated localities it has been entirely unharmed, but I can learn only of two instances where it has been injured during the past winter, that, as you say, has injured everything in your Experiment Grounds. In the severe climate of Michigan, it has escaped unharmed. I *now* regard it as one of the most hardy Raspberries in existence and the coming market berry. I prove my faith by my works, as I am planting it more extensively than all other Raspberries together. But if any one should ask, "Is it absolutely hardy?" I would answer, "No, nor do I know of any absolutely hardy red Raspberry, and I have tried about everything."

Cornwall-on-the-Hudson.

[We should be pleased to hear from any of our readers who have tested the Pride of the Hudson, how it has stood with them. Mr. Roe, as well as ourselves, merely desires to place the facts before the public. We have half-a-dozen plants received from Mr. Roe last spring. But it was late when they were received—they did not make a fair growth during the summer, and so we covered them last fall.—EDS.]

THE FARMER'S GARDEN.

THE garden is not a luxury only, but a necessity to the farmer who wishes to have an attractive and healthful bill of fare; and it seems very strange, indeed, why it is so badly neglected by many farmers. One reason, however, I think is, that it is usually in some corner near the house, and so small, and planted in such a manner, that all the labor of weeding and hoeing has to be done by the hand. Now, I believe in a large garden and in planting the rows the whole length, leaving space enough between the rows to work a cultivator. By this method most of the work can be done by the horse, and in such a garden it is a pleasure to work, while in the old-fashioned one of one or two rods square, it is a back-aching, disagreeable job, and no wonder it is left to grow up to weeds.

The location of the garden is of great importance. I prefer a gentle slope to the east or south, so that the young plants may receive the sun early in the morning. It should not be very steep, for if it is, much damage will be done by the rains of summer; and it should also be protected from the north and west winds, by a high fence, or evergreens set along the border.

The garden should be of sufficient size to allow of experiments being tried there, before being carried into practice on the farm or on a larger scale. New varieties of seeds should also be tested here. No one can have better vegetables than the farmer; and a good supply should be provided for the farmer's wife to prepare for the table in summer, as well as a lot stored for winter use. With a good garden to go to, the housewife need be at no loss to know what to get for dinner; and it is cheap fare as well as being wholesome and easily prepared. F. H. D.

Meadowbrook Farm, N. Y.

THE CLEANEST ROOT.—In a RURAL editorial an inquiry is made for the cleanest root, one which will not hold the dirt. Webb's Yellow Globe comes the nearest to this standard. They have but a single (tap) root, and may be gathered when the soil is not too wet, perfectly clean. They also yield largely and are very nutritious. The next in order is the Mangel, and the last the sugar beet. If Mangels are allowed to get dry and are then knocked together, the most of the dirt will fall off. There are so many fibrous roots on the sugar beet that the dirt is retained. Lane's Improved does not have so many small roots and may be gathered cleaner. This variety is the result of a careful selection for several years of the French Imperial Sugar Beet by a Vermont farmer. It is claimed that from 30 to 40 tons are raised per acre, at a cost of eight cents a bushel. F. D. C.

THE GREGG RASPBERRY. — Writing from La Porte, Ind., Mr. J. L. Bodge tells us follows of the new Gregg Raspberry: "I have seen twelve plants growing on a bleak, barren drift by the side of the Mammoth Cluster, last spring. I think this the time to judge of its hardiness. It stood the winter as well as the Mammoth Cluster. I pronounce it hardy (not iron-clad). Several others were killed nearly to the ground."

Floricultural.

GERANIUMS.

THE Geraniums most generally advertised at present are very fine, but decidedly inferior to some that are in the country and not for sale. Mr. White, of Chicago, has imported from time to time, the best selection I have seen. As they are not for sale, I will name a few of them with a few others procured by me from other sources: (1.) Sir John Moore—bright scarlet, white-eyed. (2.) General Outram—very dark crimson. (3.) Sir Thomas Hammersley—good enough for any one. (4.) Marginata—an exceedingly fine flesh and white. (5.) Napoleon—much like Outram in flower, but not otherwise. (6.) White Clipper—now well disseminated, very fine. (7.) Mercy Grogan—white-eyed. (8.) Attraction—finer than General Grant. (9.) Marthus, (10.) Princess of Wales, (11.) Santley, (12.) Metcalf. — all four most admirable. These make a good dozen that will gratify one who really loves flowers and understands them. Many of the newest varieties are in no way an improvement. Although the list of doubles has been generally enlarged, Gloire de Nancy stands well to the front.

A Geranium should have character. A slightly larger flower at the expense of a well-formed truss is no gain. A failure, like Le Nigré, should not be sent out. It never opens, and has no beauty—a mere twist of dark-colored petals. Startler is very large-petaled, but in no way equal to others of the same style. All that I have named are really distinct, superior and well individualized every way.

Of the dark-zoned, Black Douglass is the best. Lady Pollock holds her own well among those of that style now so well known. A few of the fruit-scented Geraniums are to most exceedingly agreeable both for house and garden.

There is no plant now before the public more to be relied on in rain or drought, in all soils, with bad culture and, better still, with good treatment, than the Geranium. In summer and winter it is always bright, not tender and so easily propagated. It is not tawdry but bright and cheerful. It is not likely to grow tiresome like Dahlias, and, above all, it affords great pleasure from the ease of raising new and fine varieties from seed. I have received several that are quite equal to imported varieties.

Those who would grow cuttings must remember to put them in moist soil and then, without letting them get positively dry, not water them any more than simply enough to keep the dirt from cracking. If you try seed, sow in a cold-frame and transplant after they are three or four inches high. Cuttings do well thrust into the open ground in May, and they will soon bloom.

To preserve them through the winter, denude them of leaves mainly, and crowd the plants into a shallow box of earth and set it in a dry cellar. E. P. POWELL.

Oneida Co., N. Y.

IVY.

IF Ivy plants, that have been kept in doors during winter, be put in the ground, on the north side of the house, for the summer, they will be benefited by the change. Such treatment renews the strength of the plants, making them better for house culture, the following winter. The Ivy is so hardy that it will bear being put out-of-doors very early in the spring. I find it better not to take the plants out of the pots, but to "plunge" them. A little common lime put under the pots, serves to keep earthworms out. When ready to remove ivy plants to the house in autumn, replant if necessary, but in pots only a size larger than those they are taken from. The scale insect that sometimes infests these and other hard-wooded plants, can be destroyed by washing in soapsuds, but they must be rinsed immediately after in clear, soft water. The Ivy must be kept free from dust, to preserve the rich gloss of its leaves. Ivy plants should have the support of trellises, to which they can easily be trained in any form to suit the taste. M. G. R.

Arboricultural.

GROWING TREES FOR TIMBER.

PROFESSOR Beal writes as follows with reference to planting trees in Michigan: "There is a long list to select from, both natives and exotics, but there is more or less doubt about the most of them. We must consider the value of the timber of each after it is grown, the rapidity of its growth, its hardiness and freedom from insects. White Oak grows slowly, and for wagons, the quality is inferior to that grown in Indiana and Ohio. The same is true of Hickory, if we take the word of our carriage-makers. There is some land in two or three of the Southern counties of our State, which produces Hickory of the best quality. For this purpose it needs strong clay land, which is valuable for other purposes. There is still some question whether European Larch will thrive in all parts of our State.

Our most valuable timber is Black-walnut, and it is getting scarce. The tree grows rapidly. It thrives south of the center of the State and in favorite places much farther north. The nuts cost something and will not always grow. The squirrels sometimes take out the nuts which are planted. They should be planted in a group by themselves, for they injure some other trees. I feel safe in recommending Black-walnuts. My first choice of trees for timber is White Ash. It is hardy over a wide range of country and on a variety of soils. It is of rapid growth and has very few enemies. The seeds are easily obtained and are sure to grow. It is one of our most valuable trees for cabinet-ware, finishing houses and for farm implements.

I believe the man who plants and takes good care of a small plot of Black-walnuts or White Ashes, will be well pleased with his experiment and receive ample reward by what he learns. I think he will receive in money value full returns for all his time, and the interest on the worth of his land."

PRUNUS SEROTINA. — Robert Douglas (of Waukegan, Ills.) says that this is the most rapid grower of all our valuable Northern hardwood forest trees, making lumber almost equal in value to the Black-walnut; grows freely on any dry land, even if too poor for agricultural purposes; healthy, of upright growth; transplants easily, running its roots deep into the subsoil; consequently well adapted for alternating with Larch, Pines or White Ash, which feed principally in the surface soil. It is commonly known as the Wild Black Cherry.

Pomological.

NURSERY TREES vs. CHANCE SEEDLINGS.

E. J. BROWNELL.

As the season for planting trees is at hand, many will no doubt be asking themselves which will be the most profitable mode of starting an orchard — to purchase nursery-grown trees, or pick up a lot of chance seedlings wherever they can be found, and, after they are well started in the orchard, top-graft them with such varieties as they wish to obtain. Even in this age of improvement there are many who will claim that the latter is the better course, but I propose in this article to review some of the arguments in favor of both sides of this question, and then give some results of my experience and observation.

The advocates of chance seedlings will claim that they get a hardier tree, and that by this mode they can make sure of securing such varieties as they wish, which they often fail to do when ordering from a distant nursery. But is their claim of superior hardiness well founded? I claim that, as a rule, it is not, provided proper care be taken in the selection of varieties that are suited to the climate where they are to be planted. I had almost said nine-tenths, and think I might safely say four-fifths, of all the trees picked up here and there all over a farm, where they may chance to grow, are of stunted growth and irregular in form, and whatever future care may be bestowed on them, they will in the end disappoint the one who attempts to secure an orchard in this way. As to the other objection — the failure to secure the varieties ordered — this can be avoided by purchasing only of such growers as have a well-established reputation; either buying directly from the nursery, or only from its well-accredited agents, for whose transactions the company is responsible.

In my own experience I have never planted a great many of these picked-up trees, though a number of years since I did make the attempt to fill out a few vacancies with such, and it proved in my case both unsatisfactory and unprofitable. The trees were about equal in size to first-class, three-year-old nursery trees; but I presume some of them had been growing at least eight or ten years to attain this size, and I believe that this is often the case with this class of trees. An acquaintance of mine has a fine young orchard, just coming into bearing, all nursery-grown trees, and, being very favorably located, they are remarkable for thrift and productiveness. Some three or four years after this orchard was planted, a neighbor of his gave him the privilege of digging, from a field of his, a lot of seedling trees of suitable size for transplanting. Thinking this would be a chance to enlarge his orchard more cheaply than by buying trees, he accepted the offer. He planted them in a field adjoining the young orchard of which I have spoken, in a situation in every way as favorable, but in the result he was sadly disappointed, a large proportion of these trees now being dead, and those which have survived having made but slow and feeble growth. In another case a friend of the writer planted an orchard of some fifty apple trees, three years ago, about half of them nursery trees and the remainder picked up around the farm. He allowed that there was very little difference to him in the first cost of the two lots, when he took into account the time spent in digging the seedlings. And, after seeing them grow for two years, he also allowed that if he could have had the seedlings transplanted without cost, he had better have paid the full price for the nursery trees.

These and other cases that have fallen under my observation, have convinced me that the nursery trees are the cheapest and most satisfactory; and if I might be allowed to give a word of advice, I should say: "If you wish to plant an orchard, secure your trees from some responsible nursery, buying direct from the nursery, if possible; if not, buy only of a well accredited agent. Be sure that your stock is in good condition before paying for it; then plant properly on suitable land, and give the necessary attention thereafter, and, my word for it, you will not be disappointed. If you wish to utilize the seedling trees on your farm, give them a little care where they grow, and, after they get to a proper size, graft them where they stand, and they will be much more profitable than if you attempt to transplant them to an orchard."

Delaware Co., N. Y.

REASONABLE FRUIT GROWING.

MORE fruit trees will die or be torn up this year than will be planted in Western New York. This is especially true of Apples, which have been for the majority of farmers an unremunerative crop for several years. Large numbers of old orchards have been grubbed out, the owners thinking that a half-dead tree, bearing worthless fruit when it bears any, is an unproductive cumberer of ground. More regard is now had to the lay of the ground on which an orchard is to be located. It will be years again before we see farmers devoting their best lots—five, ten to twenty acres of level, easily worked land—to growing Apples. It takes too long to get trees in bearing, and on such ground the profits lost from not cropping, will be, for twenty years at least, greater than could be got from apples. It is generally understood that a well-managed apple orchard in full bearing is profitable; but in growing trees from the nursery, so much time is lost that wherever land is valuable, it cannot be afforded. We must learn to discriminate in our planting. Lands where the stone crops out frequently, or is very near the surface, are worth little for cultivation, and yet are often strong enough to support good trees. Instead of culture, the ground may be mulched while the trees are young, so as to promote vigorous growth. Then on almost every farm there are odds and ends of places, good for little else, where trees may be planted. In this way fruit may be really made a surplus crop, taking nothing from the production of anything else.

Some other fruits promise better returns than Apples. Wherever Peaches can be grown one year in three they will pay. Here, I think, that with proper care in selecting localities, Peaches may be grown three years out of four. They come into earlier bearing than Apples, and the price of the fruit is always higher. Of course, the trees do not last so long as apple trees; but when they fail, it will amply pay to replace them. The same is true of pear trees. No care or system of cultivation will always avoid the blight, but if the trees are properly managed, the losses from this cause will never be very severe.

Quinces do not succeed in all localities, but where they do, no fruit is more profitable. Quinces are so good for canning, that they will always be in demand, and there are so many places where they do not succeed, that the fruit will always bring a fair price. The quince tree is tender, especially its roots. This is one reason why the trees thrive better by the sides of fences. There they are safe from mangling by the plow, and the snow banks, which in our Northern winters accumulate around fences, protect them from the severest cold. So we should plant quince trees, by preference, along fences, and in out-of-the-way places, not only because they will thus grow where the land would otherwise be unoccupied, but also because these are the best places for them.

As for Grapes, it is safe to hope that the wild excitement which prevailed a few years ago with regard to this fruit, will never be revived. Large vineyards will be planted in localities where the soil and climate are especially adapted to grape growing, and by men who thoroughly understand the business. But so many novices have been badly bitten by planting largely on unsuitable ground that this sort of thing is not likely to be repeated. The great benefit which will remain after all the failures in extensive grape growing, will be the ascertained fact, that some variety is adapted to each locality, and that everywhere all who have even a small piece of land can grow Grapes enough for home use.

Monroe Co., N. Y. W. J. FOWLER.

The Herdsman.

HISTORY OF A POOR FARM—NO. 8.

THE practice of soiling stock is one that specially commends itself to the owner of a poor farm. In no other way can the same area of land feed so many animals, and in no other way can so much manure be saved from an equal number of cattle. With artificial fertilizers to begin with, it is not difficult to grow such crops as will furnish feed for cows in succession throughout the season, so that they may be kept in stables and yards, and all the manure be saved.

With this end in view, I sowed fall rye from early in October up to the end of November, and now when the warm spring weather has started growth, the earliest sowing looks very thrifty and the latest is already covering the ground with green. As a test of the permanent or possibly evanescent effects of artificial fertilizers, this is valuable. This ground has received no manure of any kind since 600 pounds per acre of the Mapes' potato and corn fertilizers were used last year on those crops. I see no better rye upon any of my neighbors' fields, and my friend, Mr. Martin, who is well-to-do, and a forehanded farmer who manures liberally, confesses my early-sown plot is as good as his best. By invitation of Mr. Martin, our usual little *coterie* visited him at his pleasant home across the road. A plain, white-painted house, with the usual green blinds common to New England and by New England people introduced even into the western country, was cosily shaded by evergreens of different kinds. A tasteful lawn lay in front of the house, with winding paths bordered by flowering shrubs, of which the yellow-flowering Currant and the frequent Forsythia or Yellow Bells, were already showing their heads. It was here that we fell into conversation on fodder crops. My old neighbor, averse as he generally seems to be to what he calls new-fangled notions, thought the practice required too much labor for profit.

"Soiling cattle, and cooking food for them, are played out," said he. "How many farmers are there now who cook the food for their cows, as we heard so much of, some years ago? Here's Mr. Martin himself has his steam-boiler in his barn basement and his steam chest is now a house for his Pekin ducks, I believe."

"That is so," laughingly replied Mr. Martin. "I confess I tried steaming food for my cows and gave it up, because I thought the advantage did not warrant the expense, and the steam chest was put out of the way in a corner of the basement where the ducks found it, and appropriated it for their quarters at night."

"What has this to do with soiling cattle?" I asked. "In this case one has no choice, it seems to me; while with regard to cooking or not cooking, the case is otherwise. When there is no pasture, what is one to do? All the pasture possible for me is a few acres of clover which would be eaten down in two weeks, and I expect to make it to last two months by cutting it and feeding it in the stable after the rye has been eaten and before the oats are ready. Here is my plan: The rye from present appearances will be ready to begin cutting in a month or less. There are six acres. If two square rods will feed a cow a day, the six acres will feed 10 cows 48 days. In less than 30 days from the middle of May the clover will be ready to cut. Five acres will last 10 cows 40 days, but before that time has expired a second cutting will be ready on a part of the ground. By the time the clover is finished, or before, the oats I have been sowing to-day, will be in ear and may be begun. After these have been used, the next sowings will come in, and then sweet corn sown on the rye ground first cut, will be ready. A succession of this crop will furnish feed until late in September, with Hungarian-grass sown on the first cleared oat ground, and Long Early Blood beets on the second cleared rye ground for a change. You see there will be two or three crops on some of the ground and a large portion of these that cannot be used, will be left to cure for winter feed. Then there will be several acres of sugar beets and mangels for next winter. There will be six acres in rye; five in clover; five in oats and five in roots, and the rye ground will be planted in corn and the oat ground as well, and there will be some second crop of clover to be cut. I do not doubt I can feed more than 10 cows the entire year on those 21 acres, considering that all the manure that will be made will go on to the land and some artificial fertilizer besides. The 10 cows bring in $3.50 a day, counting among the 10 the dry ones as well, and will continue to do that. Two men costing together $45 a month, and three horses, will do all the work of the farm and the dairy, and there are 44 acres left to be made available for such other crops as can be grown. I cannot say as yet what can be done, but at present, I see no reason to doubt that the plan will pay and leave something in addition. How it may turn out will be a matter for future report."

"Let us change the subject," said Mr. Martin. "I see Fred has got into hot water about his Ayrshires, and that Mr. Hoxie is 'giving him fits' for saying that animals consume food in proportion to their live weight. Here is the RURAL for last week, in which Mr. Hoxie "gets mad" because his favorite Holsteins (he ought to call them Dutch, I believe) are 'sat upon' as you might say, in favor of the Ayrshire cows. Let me read what Mr. Hoxie says:

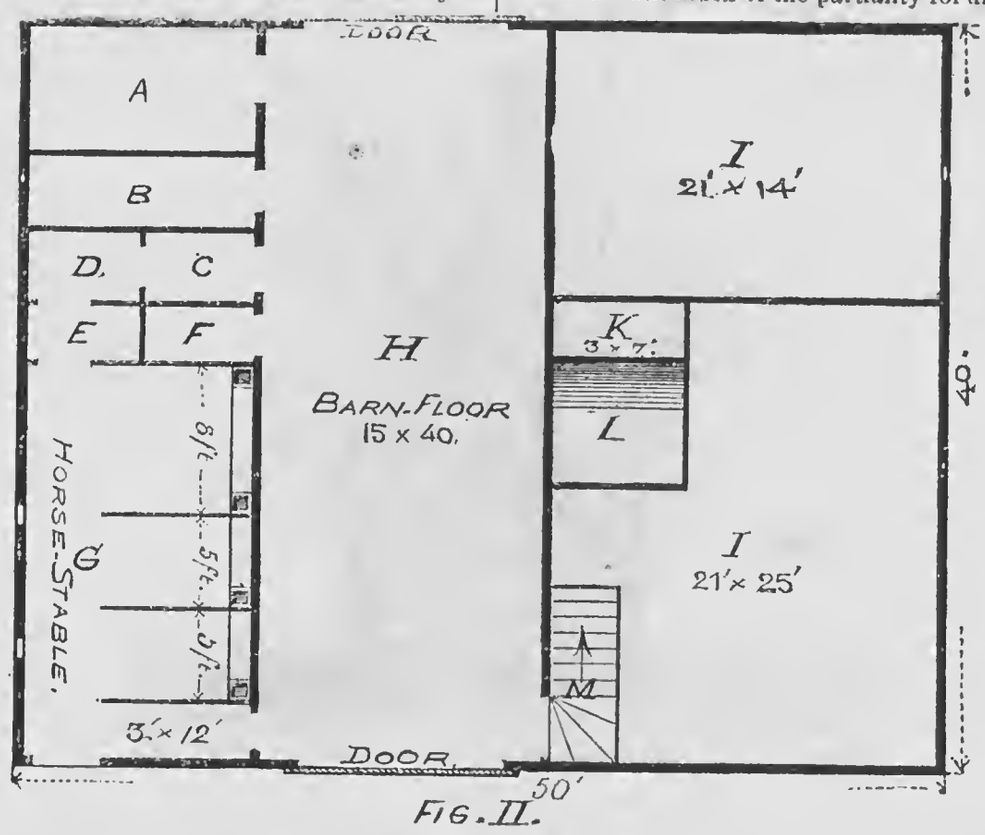


FIG. II.

PLAN OF SECOND FLOOR.—(SEE FIRST PAGE.)

"Well, what of it?" remarked the old gentleman. "Fred is right. Mr. Hoxie does not fight fair. He compares well-built Short-horns with 'coarse-headed gothic-ribbed' ones. I don't know what 'gothic-ribbed' means; but I suppose he means pinched-in, unthrifty ones. That is hardly honest, because if Mr. Hoxie knows anything about cattle, he knows a fine-headed, fine-boned, well-built animal, will consume less food in proportion, than a coarse unthrifty one. There was no comparison of that kind made by Fred. On the contrary, it was of a well-bred, heavy Short-horn or a Dutch cow, with a smaller but equally well-bred Ayrshire. There is no ground for any fair objection in this case. As for my opinion that the Jerseys have ruined the stock of cattle here, I know it to be true and scores of farmers who were induced to change their natives for light grade Jerseys, are now very sorry for it. I think the RURAL should give farmers an opportunity of stating their opinions as well as those who breed cattle to sell to them. We do not want to be led too much by breeders of stock, and I should doubt the judgment of any man who thinks any one breed is the best for every place and every use."

"Mr. Hoxie breeds Dutch cattle for sale," I replied, "and of course he feels more interested in them than he does in any other breed. Like many men who have strong convictions, he fails to give others credit for having equally strong ones which differ from his, and that leads him to criticise unfairly. I know very well, for instance, that 'Jerseys are *among* our most valuable breeds, etc.,' (I excuse the bad expression because the gentleman was a little "mad," no doubt) but to say that they are not the best for milk is not a 'childish attack' nor is it devoid of truth. No milk dairy can use Jersey milk, for good reasons, and it is a question whether Jerseys or Ayrshires are the better for butter; while there is no question at all that no experienced butter dairyman can easily be induced to keep Dutch cows for that purpose, and especially on a poor farm. But where is Fred? Let him come and defend himself."

"Never mind Fred," said his grandfather "he is discussing dairy matters with Miss Martin in the kitchen, and I guess he won't care about Mr. Hoxie's criticisms just at present. He has something in his red book that will meet the case some other time."

"Mary is my dairymaid," said Mr. Martin, "and she has something to say on these matters one of these days. She milks the cows, cares for the milk, makes and packs the butter, and doesn't think it hurts here in the least. She is not compelled to do it in any way, but she chooses to do it, and I have no objection. It is useful knowledge and if a girl fancies it, there are certainly less useful and more objectionable ways of spending time."

CRITIQUES ON CATTLE.—Cattle breeders and owners are immemorially sensitive to disparaging remarks made on their favorite animals or breeds. In this connection a friend writes: "You can't touch a breed without all its friends assailing you; and you can't befriend one, without all its enemies attacking you, too. The more criticism the better; for in a diversity of opinions there is often much instruction. I can show you a pure Ayrshire heifer, two years old, that milks 14 quarts a day and makes eight pounds of butter a week besides giving cream for tea, coffee, pies and things. The best Ayrshires in the country are the herd of W. Crozier, of Long Island. One of his cow's milk was carefully tested the other day and it beat in quantity of cream that of a Jersey cow which he sold a few days afterwards for $1000—there were 2½ inches of cream on 10 inches of milk. But much of the partiality for different breeds is merely a matter of liking; for a man is often apt to look on his own favorite cow or breed as the best, just as in his honeymoon he is likely to consider his own wife the best woman in the world, while regarding his neighbor's as a very ordinary "critter"—though afterwards he sometimes changes his opinion both as regards wives and cattle."

Dairy Husbandry.

ROOTS FOR COWS IN MILK.

M. OAKEY.

A counterblast against their use; objections to them; an excellent substitute; the two compared.

No more roots for me. From this time henceforth I will grow no more of them for feeding cows in milk. From first to last my experience, is against their employment, despite the belief in their merits of the agricultural world. They have, in my opinion, usurped a place which of right belongs to another kind of feed; for cotton-seed meal has the right to the supreme affections of the dairy public, which roots have usurped and are striving to maintain. Here are the counts of the indictment against them.

First; roots are a bother to keep, causing some expense, much inconvenience and sometimes loss. It is a nuisance to dig them out of the frozen pits in which they must be kept, unless one builds a cellar especially for them.

Second; it is an expense of time always, and of either muscle or money, or perhaps of all three combined, to properly prepare them for feeding.

Third; they are dirty and gritty, injuring the teeth and the feed, and hurtful to the membraneous lining of the stomach, while to cleanse them requires so much labor, and is so disagreeable a job in cold weather, as to be a serious objection. It is generally not attempted.

Fourth; they are so cold when taken into the stomach of the cow as to be wasteful of flesh and milk, because the chill they occasion requires considerable vital heat to counteract, and a certain amount of nutriment consequently is lost.

Fifth; they are too watery, and though water is good, too great a dilution of the nutriment in any article of diet is objectionable, requiring too great an expense of vital force to separate the little nourishment it contains, and to cast off the great amount of worthless matter.

Sixth; I have derived very little benefit from their use. If I did not use ground feed, of course there might be more profit in them, but my experience when feeding half a bushel per day of beets or carrots is, that there is hardly a perceptible difference in the yield of milk; That is, it has not increased materially over the yield I obtained from ground feed alone—corn, oats and bran.

Seventh; they do not "pay," for the extra expense is not returned in milk, while they cost more than cotton-seed meal which does pay both in milk and butter, and which also answers the same purpose usually assigned to roots, with far better results and with none of the drawbacks stated above. The meal is not a nuisance to keep; is not troublesome to prepare; is not dirty; is not cold and wasteful, but warm and economical; is not diluted, but concentrated and easily digested; and, furthermore, it returns more than its value in milk. In addition to this, it may also be said that it requires no cultivation to bother one when other farm crops demand attention.

The best statement of beet-growing I can find gives an average yield of 900 to 1,600 bushels to the acre, costing 10 cents per bushel. This beats my efforts "by a long shot," but I accept it as an average in order, in the comparison, to lean as much as possible to the weaker side. Feeding a half bushel per day is an outlay of five cents per cow—result, a little more milk, certainly not over a pint, worth here four cents which do not pay the cost. Cotton-seed meal costs me 2½ cents per pound. I feed three-quarters of a pound in the morning and the same at evening, mixed with the same quantity of ground feed used with the beets or carrots. Cost of 1½ pounds, 3¾ cents per day—result, one cow yields an increase of three quarts; another, 2½ quarts; and this is a pretty uniform average increase. The profit is a saving of 1¼ cents per day in expense and a gain of from 16 to 20 cents in milk. This may be more than the milk is worth elsewhere.

Perhaps I am a very poor root grower. Very well, that would be objection number eight against roots. I am not the first writer, however, who has declared beets have been of no benefit. It would be too cruel to mention the extra value added to the manure, for then think how harassing it would be to the "authorities" who support the use of beets for milch cows, so I refrain from saying anything about it. But no more roots for me. Cotton is king.

Middlesex Co., N. J.

VAN'S VIEWS.

Claims and Performances of Dairy Cows.

IN the recent lively discussion in the RURAL concerning the merits of dairy cows, many statements are made anent the large yields of milk and butter given by some of them. But I am tempted to ask whether any reader of the paper ever bought a cow, of which it was said that she gave a barrel of milk or two pounds of butter a day. If any one has made such a purchase, didn't she deteriorate suddenly after the transfer? I bought a cow that was in prime condition according to the statement of the man who sold her to me; his wife, he declared, made ten pounds of butter a week from that cow's milk.

As none of our cows was able to give milk which would make over seven pounds in that time, I thought the new-comer would prove a bonanza. We kept her nearly one year, and her product during that time was only about four pounds of butter per week for the time she was giving milk. A neighbor who bought a two-pounds-of-butter-a-day cow from a kid-gloved farmer who had sold his farm to be laid out in building lots, paying $100 for her, when common cows were selling for $25, was also disappointed. His cow had a pedigree like that of a race-horse, a broad, straight back, a fine milk mirror, etc., etc.; but she did not perform as well at the pail or churn as some of his "scrubs." Now, both of these cows were put on feed as good or better than they were used to; they were bought of men of good reputations for integrity, so it's charitable to suppose that these men did not accurately weigh their butter but "judged it."

I owned and milked a cow that would fill a fourteen-quart pail (I have measured the pail, it is called a fifteen-quart pail) twice a day from calving time in April till July drought. She was as poor a butter cow, however, as I ever milked. Now, it may be a confession, but I have never known a cow that would average one pound of butter per dry for nine months in the year, and among the Short-horns I have known, I never knew one which would do half that. We bought a cow once, which was a well-bred, large, fine-looking animal. She was seven-eights Short-horn; she was from famous stock; the man who owns her now brags of her—but we had natives which were much better cows.

Now, my friends, these Short-horn breeders out here in Wisconsin are able to control our State fairs. It is impossible to get a fair premium or competent judges for any other breed. One of the judges of Jerseys at our State fair remarked that he knew nothing about Jerseys, and the more Short-horn and the less Jersey a cow had in her, the better he liked her. These breeders are rich and with their fine catalogues and splendid displays (unmerically) at our fairs, they manage to keep up a factitious interest in their ponderous animals. Many a farmer has ventured some of his hard-earned dollars in this breed, only to find, after years of patient, skillful feeding and care, that his butter yield was growing less and less, and that nothing was sure but disappointment.

It is worth one's time to go forty or more miles to look over a herd of this breed. You will be surprised, or at least I was, to find how often the "show" animals fail to breed, and the number of three-teated and otherwise deformed cows that are among the breeders.

"Hasten slowly." Read Mr. Hardiu's article in the RURAL for Dec. 7 1878. Study his table. An old Englishman of my acquaintance, who has a wide experience, says that table is about as he found the breeds to be.

Brown Co., Wis.

Everywhere.

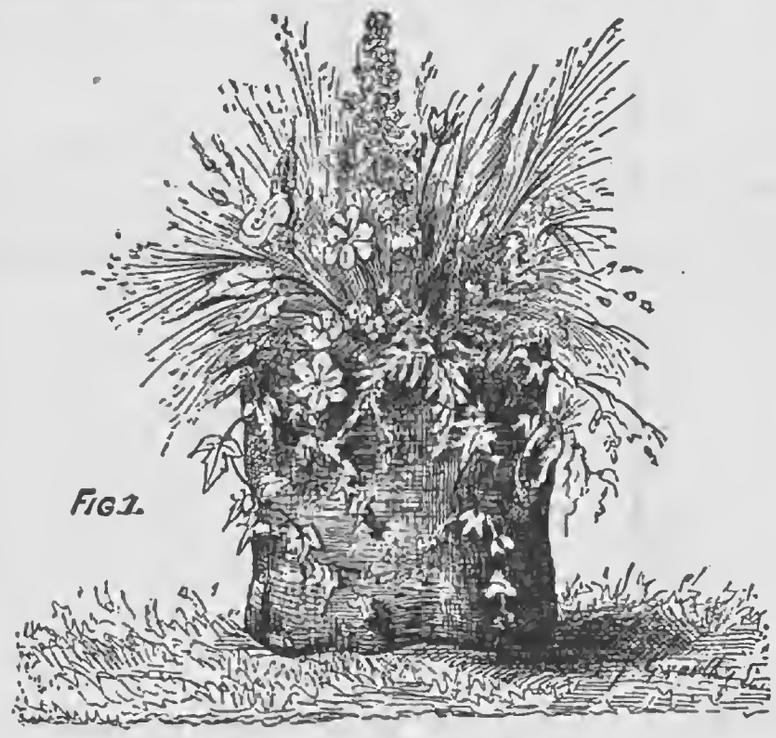
RURAL SPECIAL REPORTS.

KANSAS, Parsons, Labette Co., April 14.—We are not surprised here at our coutinuous and changeable winds, for they are almost of certain occurrence in the spring and the fall, but we *are* surprised with a dry spring. Usually there is great difficulty in having weather dry enough to plant. This year we have not had more than one inch of rain, excepting the December snows, some of which entered the ground in January. There is supposed to be enough moisture in the ground now to cause the seeds to germinate when sufficient heat has been received. Oats are up and look well. Some pieces of winter wheat (no spring wheat here) look fairly; others look poorly. Castor beans and corn will be nearly all planted at the end of this week, four-fifths of the whole being now in the ground. The seed was never placed in a more fitting condition of soil, and it is an excellent aid to a big crop. Our season is fifteen or twenty days later than last, but is as early as the average season. Our Peaches and Blackberries have been affected injuriously by the severe winter, and already there are signs of higher prices for dried fruit. Away off towards Colorado, in the western and northwestern portions of this State, the drought has been felt more than here. The splendid wheat crop of that region last year induced an unprecedented immigration this spring, and there are signs of damage to the crops there, by the return from that region of quite a number of emigrants. The newspapers, of course, say that there has been a splendid rain all along the line, but if not more than we have received during the same storm, it will hardly do any good. The land beyond the 100th degree of longitude must have plenty of rain to make a crop. Two or three wet years have set men to generalizing on the change of the climate, just as they did last winter, when the winters were said to be getting milder, and this winter found their generalizations fallacious. People, however, must have the fatal 160 acres; while, if they would survey the State through, they would discover that of every 160 acres that are settled, an average of over 40 acres are a loss to the owner. Corn in the northern portion of the State sells as low as 10c. per bushel, and as this rate is less than $3 per ton, and as coal is from $4 to $6, the corn of course is the cheapest fuel, and it is thrown about as if it were chips, or weeds, or rubbish. In regard to grass, it can be bought at 10c. to 25c. an acre for hay, and stock are herded and salted for 25c. per head per month. So, forty acres in cultivation at 10c. per bushel for corn, is bad enough, but the product of the grass will not even pay the taxes, so people that *must* have 160 acres are "land-crazy." J. B.

TEXAS, McKinney, April 13.—Our prolonged drought was brought to an end by a heavy hail storm, the like of which was never witnessed here by a white man. I've been a resident of Texas for 30 years, and hail in drifts three or four feet thick, 12 days after it fell, with thermometer often at 70° Fah., I consider a remarkable phenomenon. The belt along which this scene could be witnessed, however, was only from three to four miles wide. We are now busily engaged in planting cotton, having finished drilling pearl millet this week. The Stormproof cotton seed is in great demand, selling as high as at the rate of 75c. per bushel, with a limited supply. There's a fine opening in this country for manufacturers of wood work of all kinds for wagons, reapers and mowers, plows, axe-helves, hoe-handles, etc. We have here an abundance of Bois-d'are, the best kind of wagon timber; still, Racine, Wis., sends us our wagons; while reapers and all wooden implements are likewise sent us from the far North. Fine Pecans, Ashes, Oaks, etc., abound in our bottom lands, still, we go to the wooden and hardware dealers for the implements made of such wood, so that lack of enterprise or capital may be justly attributed to this section. Real estate was never so low here since the troublous days of the Texan Republic, away back before '45. Farms once valued at $20 per acre, could now be bought for one-fifth of that amount. Money is so scarce that usury is popular; for men in debt are glad to be able to borrow enough to pay off old mortgages, at 20 to 24 per cent., and to get it at this rate they readily burthen themselves with new mortgages. Just now we are having copious showers, and farmers are jubilant over their crop prospects. W. N. W.

NEW YORK, Corning, Steuben Co., April 19.—We are having an unusually backward spring, snow to the depth of two inches covers the ground. No seeding has been done yet, and the excessive moisture in the ground will not admit of it within several days. The fallacy of sowing winter wheat late on account of the depredations of the Hessian Fly, is apparent this spring in the innumerable fields which show scarcely any top at all. It is strange how readily farmers adopt almost any new theory at the outset.

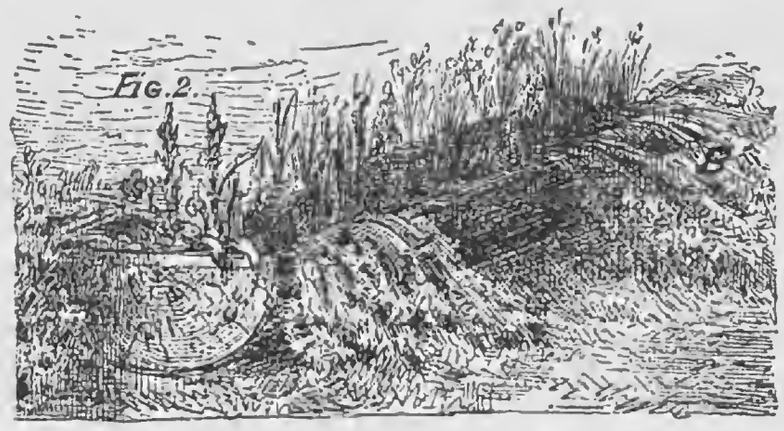
I had intended to sow the barley this week, but a cold storm of rain and snow has changed



SECTION OF HOLLOW TREE USED AS A VASE.

my intentions. I have always been most successful when my seed was sown early, yet it is poor policy to get seed into the ground before it becomes warm and sufficiently dry to be thoroughly pulverized. I shall sow the six-rowed variety; for what is lost in difference in price between that and the two or four-rowed, will be more than made up by the heavier yield. Any good corn land will produce barley and its culture in this section is gaining in extent every year. Nearly as much barley as oats can be grown on an acre, and while oats bring but 30c., barley I have never sold for less than 80c. per bushel. Added to this, the straw is fully equal to that of oats for feeding purposes, the grain superior, while the land is left in fair condition for any other crop. I know men who consider barley stubble fully equal to summer fallow for wheat. In proof that oats are very exhaustive to the soil, we have but to observe the farms about us whose owners grow oats as a principal crop. J. L. N.

NEW YORK, Upper Red Hook, Northern Dutchess Co., April 19.—Winter seems to be unwilling to allow spring to assert her supremacy, and has accordingly presented us with a snow storm of nearly four inches. Farmers are anxiously looking forward for good weather so that plowing may be commenced in earnest; but little of that has been done as yet, and a little garden alone has been made. About ten days later than this last year, the trees were commencing to bloom; but as appearances indicate at present, the buds will not open in a month yet: A larger quantity of manure than usual was made during the winter, owing mainly to the greater amount of straw, and the low prices it has been selling for. Most farmers are realizing that it is far better to convert straw into manure, than to sell it at $5 and $6. per ton. Winter grain generally looks very well, though we have not so large an acreage as last year. Wheat is again growing into favor among us, more being sown each season. Apples have kept a great deal better than usual and are now quite abundant. We have scraped a large number of young apple trees this spring and for this purpose have found that an old iron candle-



HALF OF HOLLOW LOG, WITH UPRIGHT AND TRAILING ANNUALS.

stick is an excellent thing—the most convenient instrument to handle, and one that will do the work to perfection. The small end can be used in the joints of the limbs, and will effectually remove all sorts of dirt. The edges, if too sharp, may be filed a little, so as not to injure the young bark. In cases where the old bark is very stubborn, a glove should be worn to protect the hand, though in most instances this will not be necessary. W. S. T.

VA., Henrico Co., April 22.—The past winter has been quite severe here. We have had but little snow; the ground was frozen only about six inches. Wheat and rye wintered well and are now looking fine. Winter oats did not do so well; spring oats are all up early. Potatoes are about coming through. Fruit trees are all in full bloom, and I do not think they are much injured by late frost. On the 11th of March I took a trip to Wayne Co., N. Y. I found the roads in a fearful condition. There was neither sleighing nor wheeling, while here the weather was like summer, and the roads were dusty. We want more men from the North to come here to take up the land that is lying idle and can be bought for from $2 to $30 per acre. It is true it needs improving, but it is easily bettered and holds improvement. Here we can raise anything that can be raised in any other States, except tropical fruits and some other things that cannot be produced North. I have been here two years, but I do not talk like Holt from Missouri or borrow trouble, because the weather does not act just to suit me. We are looking forward to better times; economy and perseverance will soon bring those happy days about. W. B. H.

OHIO, Tontogany, Wood Co., April 20.—Weather pleasant now; very little frost. Wheat looks well. Last year's crop was good, the average yield in this part of the country having been from 20 to 30 bushels per acre. Corn was a medium crop, average yield 30 to 50 bushels per acre. Oats, too, were only an average crop. Wheat sells for $1 per bushel; corn, from 30c. to 32c.; oats, 20c to 22c.; hogs, $2.75 to $3 per 100 lbs.; clover seed, $3.90 to $4. The farmers in this neighborhood are getting along well with their spring work. They are now sowing oats and spring wheat and making gardens. Farms here are being drained extensively. Tiles are always used with much advantage. Six years ago my farm of 70 acres was lying in the bush, and now it is all improved except 13 acres. I have built a house, barn and other necessary buildings. Land here is a sandy soil with clay bottom and is good for every sort of crop. We have a fine outlet for draining and plenty of all kinds of "privileges" that contribute to make a country prosperous. W. H. B.

WISCONSIN, Arcadia, April 20.—Our spring opened about the usual time, although much later than last year. Seeding for wheat is nearly completed. Many are selling out and going West. Few improvements are being made hereabouts at present—all are waiting for better times. This is a good place to come to settle, if one wants improved farms at a moderate price, together with school and church privileges. There is plenty of wood and water; the soil is a sandy clay and loam. Prices are about as follows: wheat, 80c.; corn, 30c.; oats, 20c.; potatoes, 40c.; butter, 8c. to 10c.; eggs, 6c. per doz.; hay, $8 per ton. F. A. R.

TEXAS, Caldwell, Burleson Co., April 21.—My children as well as myself are great lovers of flowers; the experience derived from the outlay of $100 spent in three years for trees, flowers and vegetable seed, teaches me to go slowly. The weather has been dry for six weeks or more; still everything looks well on land that was broken early and thoroughly. Wheat and Apples scarcely pay their expenses in this county; but all other grains and fruits, as well as vegetables, do well. Our "branch" and river bottoms are the cane-growers' paradise. With a little winter care Oranges bear some fruit here. Wheat is worth 80c.; corn, oats, rye, barley and sweet potatoes, 50c. per bushel; golden millet, $1.80; bacon, 6c. to 8c. per pound; butter, 10c. Chickens and eggs find no market. D. H. H.

MINNESOTA, Howard Lake April 20.—Winter still lingers in the lap of spring. Farmers managed to sow quite an amount of wheat in March by doing it at intervals of good weather. After having a remarkable scarcity of water—wells going dry so that people from the country for miles around, draw water from the Lake here—we had a pleasant rain in just the way the wheat needed it. Slowly and quietly it fell on the 10th inst. but the wells do not fill yet. No 2. wheat from yesterday fell a trifle. It is only 73 cts; corn, 30c; oats, 30c; potatoes, 25c; best butter, 15c. S. A. M.

NORTH CAROLINA, Henderson P. O., Granville Co., April 12.—We had splendid weather during March, and on the 30th Peaches, Pears, Plums, Crab Apples and Cherries and some of the early Apples were in full bloom. On the following night a cold north wind chilled us, and since then the nights have been bleak and frosty, so that our prospects for fruit are entirely blighted. W. M.

OHIO, Atlanta, April 20.—Spring late. Farmers very busy plowing. This time last year some were planting corn. Prospects for wheat, good. Grass, fine but late. Apple trees beginning to bud; all sorts of fruit apparently uninjured. Corn, 35c.; oats, 20c.; wheat, 85c.: horses from $50 to $125; cows from $40 to $60; land from $40 to $60 per acre. A. L.

NEW YORK, Cornell University, Ithaca, April 20.—We have had no spring weather yet worth the mentioning. Ground still covered with snow; no seeding or planting done. President White leaves us in a week. We are sorry that he is leaving us, but rejoice that our country is to have so able a representative at Berlin. N. B. L.

NEW YORK, Sharon Center, Schoharie Co., April 19.—Two feet of snow fell here yesterday and it is still snowing. Prospects for an early spring have all vanished. Hay is abundant; stock scarce; cows are worth $25 to $35; butter, 12c. to 14c.; eggs, 10c.; wages, $10 to $15 a month and board. S. L.

NEBRASKA, Brownsville, April 19.—I have already planted nearly 40 acres of orchard and am still at work. Fruit prospects in this section are good. R. W. F.

Miscellaneous.

A GOOD USE FOR OLD LOGS.

WITH very little trouble hollow logs can be made to serve a good purpose in the rustic decoration of lawns. In Fig. 1 is shown one plan of utilizing a section of a hollow tree. A part, from one to two feet in diameter, with a solid rim from two to four inches thick, is cut to a length of about two feet, set upon end in any desirable spot, filled with good soil in which seed may be sown of plants either of a trailing, or a low upright habit, like Candytuft, dwarf Asters, etc.

Should a larger surface for planting be required, a section may easily be cut six or eight feet in length, and divided lengthwise some distance above the center. Then strips may be nailed across the ends of the larger part; the hollow filled up with earth, and set with such free bloomers as the Petunia and Verbena; or, a strip through the center may be devoted to low-growing annuals, and the sides and ends to trailing vines, as shown at B. in Fig. 2. Leave the bark on, and in the split section bore small holes in the bottom to let off superabundant moisture. When the plants are well established, it is a wonder to many how such mounds are kept in position, as their floral embellishments seem to grow from mounds of solid earth. L. D. SNOOKS.

WHAT OTHERS SAY.

HYGIENIC VIEWS.—At a late meeting of the W. N. Y. Farmers' Club as reported in the American Rural Home, Mr. P. C. Reynolds said that one cause of weakened digestion leading to dyspepsia, is the habit of eating, in hurrying seasons, when very weary. The farmer is laboring hard in the field, the dinner-horn blows, he hastens to the house, sits down to the table and hastily eats his meal. The body is so exhausted that the vital forces are drawn from the stomach, and digestion proceeds slowly and imperfectly; the system is not properly nourished by the food, and, after a while, the horrors of dyspepsia are experienced. No man has a right to allow the urgency of work or

business to override the claims of the laws of health. In the first place, he should not push his labor to the extent of physical exhaustion; and, in the second place, he should, most scrupulously, insist upon resting a few minutes before eating his meals. . . Mr. John R. Garretsee said he had ventilated his cellar by accident. When he married, his wife had always been accustomed to baking in an oven, and so he made an oven in his cellar. She used it for baking once, but it always served as an excellent ventilator. We hear every year of sickness in farmers' families from decaying vegetation in the cellars. . . Mr. Glass said that some years ago, while digging a canal in Pennsylvania, every one employed had the ague, excepting the superintendent, and he never went out until after breakfast.

MR. MECHI'S NOTES.—The following are among the recent notes of the distinguished Tiptree Hall (England) farmer to the agricultural press:

"Manured our land for mangel direct from the covered yard where each young man filled twenty carts in ten hours. Six acres were thus quickly manured without the intervention of a dung heap and twice handling. The manure is now being spread, after which the land will be plowed and subsoiled. . . .
In our thirteen acres (chapel land) the powerful steam plow in 1874 left us a legacy of hard work in every subsequent tillage. It was a great and unprofitable mistake to bring to the surface so much of the glutinous yellow plastic subsoil, and many have had to regret their indulgence in disturbing too deeply these tenacious soils. . . . We suffered less where the land was only steam plowed, and then next year again steam plowed, so that the bad soil was sent down again; but where after steam plowing, the land was steam cultivated, the bad subsoil got inextricably mixed with the better soil, much to the injury of the crops."

CAUSES OF DISEASES.—Mr. Vick says in the April number of his magazine, that our wisest physicians are now looking more to the cause and prevention of disease than to its cure. A few years ago, on the arrival of the physician, after inquiring for the symptoms, the next inquiry was, "Let me see your tongue." Now it is, "Let me see your cellar." He thinks that one-half the diseases of the world are caused by bad ventilation and want of proper drainage, and nearly all the other half by improper food eaten in an unreasonable manner, and by insane pleasure-seeking, foolishly called recreation. Again he remarks, that if air changed color when impure and unfit for breathing, and became red or blue, what a revolution would be made in our houses, and how uneasy and frightened the people would become in some of our public halls and churches. In such cases, Mr. Vick thinks that many long-talkers would be left to teach wisdom to empty seats.

Farm Topics.

SUGAR FROM SORGHUM.

Present Condition of the Industry.

A WONDERFUL interest in the manufacture of sugar from sorghum is arising throughout the length and breadth of the United States, and the production of sugar from this source now bids fair to become one of our most important industries. This subject not only attracts the attention of farmers, but it is a question of national importance; for when we reflect that the enormous sum of $100,000,000 is annually paid by this country for foreign sugars, it may well be desired that the industry should assume such dimensions as will enable the country to retain at least the greater portion of this sum. And apparently there is no reason why this cannot be done.

Competent gentlemen in many different States have, by repeated trials, produced from sorghum, especially from the variety known as Minnesota Early Amber, sugar that is pronounced as good as the best quality of New Orleans sugar. Moreover, cultivators of this cane assert that the production of leaves and seed per acre, irrespective of the stalks from which the sugar and sirup are manufactured, is equal both in quantity and quality, for feeding purposes, to that of corn. So, if the cane is grown as a fodder crop, the sugar and sirup, which may be had for the manufacture, are thrown into the bargain.

The great drawback that has prevented an earlier rise of this industry, has been the inability to crystallize the sugar. This difficulty seems now also to have been obviated, inasmuch as Prof. F. L. Stewart, of Pennsylvania, has discovered a solution which he claims will every time produce crystalization of the sugar both of sorghum and corn-stalks. Moreover, he asserts that by his method of manufacture 2,000 pounds of sugar can be produced per acre. Whether this is substantiated by facts we are not prepared to say, though as yet, we are not aware that it has been contradicted. In February last, sugar-makers from many of the inland States, and gentlemen interested in the business, to the number of nearly forty, met in convention in St. Louis, Mo., for the purpose of organizing a permanent society. A society was formed, to be known as the Mississippi Valley Cane Growers' Association; a constitution was adopted, officers elected, and a general exchange of views took place. Great interest was manifested by the members in the subject of their meeting, and many of these practical men, who had made sugar and sirup from sorghum for upwards of twenty years, expressed the belief that the industry would speedily assume colossal dimensions.

This convention, in connection with the interest taken in the subject by the Agricultural Department at Washington, the perfection reached in the necessary machinery and Prof. Stewart's discovery, all unite to give an impetus to sugar-making, that we trust will prove most wholesome to the country. A staple commodity like sugar, if of good quality, will always find a ready market, and so far, cane growers have been able readily to sell their sugar and sirup at considerable profit. To attain the best results requires, however, experience and some considerable outlay in crushing mill, evaporators and other apparatus. The

Cultivation of the Cane and the Manufacture of the Sugar

appear to be in brief, the following: Though sorghum will grow on any soil, it prefers a rich, sandy, upland one. The land is prepared as for corn, and the cultivation of the crop throughout does not deviate materially from that of corn. The seed is planted either in drills three feet and a half apart, or in hills at the same distance. If planted with a drill, it should be set to drop about six or eight seeds to the foot. Later on the rows are thinned to three or four plants to the foot, and ten to twelve canes may grow in a hill. While the seeds are still soft, just before they ripen, the leaves are stripped from the stalks, the seed clusters cut off, and the canes brought to the mill for the extraction of the juice. At this stage of maturity the stalks have been found by experiment to contain the most cane, or crystallizable sugar, while the proportion of glucose, or sugar from which only sirup can be made, gradually decreases during the growth of the plants, till at this period it is smallest. The percentage of sugar varies much with the variety of sorghum, and the soil upon which it is grown; and the relative proportion of the two sugars will also vary with the same causes; but ordinarily, the Early Amber contains, at this period of growth, while the seed is in the dough, about 13½ per cent. of sugar of which eight to ten per cent. is cane sugar and the rest glucose. It is also found that the crystallizable sugar gradually changes to glucose, if the canes stand for some time after they are cut before the juice is extracted. The juice should therefore be pressed out soon after the canes are cut, if it is desired to make sugar. During the whole process of manufacture, the juice should be exposed to the air as little as possible, as such exposure accelerates souring and hinders crystallization.

When the canes have gone through the mill, the juice is conveyed to a tank large enough to hold as many gallons as can be handled at one time. For the reason stated above this conveyance should be either through pipes or a covered wooden conduit, and the tank should also be covered. A sufficient quantity of juice having been extracted, it is brought into the heater, a large kettle of iron or copper, and here heated to 170° or 180° F., as ascertained by immersing a thermometer in it. As the heating proceeds, part of the albumen in the juice coagulates, rises to the top and is removed by constant skimming. But another portion is held in solution by the free acid in the juice; so, in order to coagulate this, the acid must first be neutralized. This is done, at the temperature named (about 180°) by adding milk of lime, from six to seven pints to every 100 gallons of juice. This being thoroughly stirred in, another layer of scum will soon be formed.

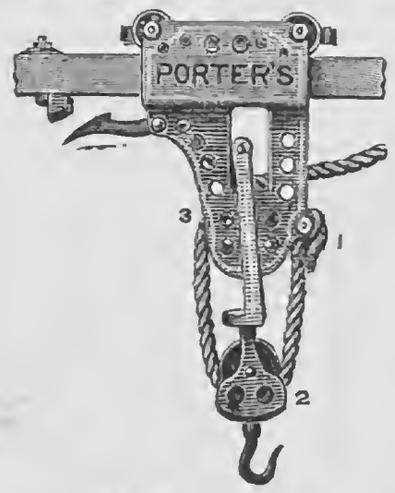
When all of this is removed, the contents of the heater is run into another tank to settle. Here the lime and other impurities sink to the bottom, while the clear liquid is siphoned into the evaporator. This should all be done before it has cooled down below 150° F. At this temperature the sulphurous solution discovered by Prof. Stewart, is added in sufficient quantity to neutralize the lime which otherwise would prove injurious, and to bring the juice back to a slightly acid state, as ascertained by litmus paper. Next, the juice is evaporated as rapidly as possible and put into a cooler for granulation. To facilitate crystallization a machine called a centrifugal mill, has been invented. It is worked by hand, and is similar in its action to the honey extractor. The sirup is put into pans with numerous small holes. These pans are made to revolve at a rapid rate, which throws the sirup out and the granulated sugar remains in the pans.

One hundred and fifty gallons per acre are considered a good average yield, though, perhaps, it falls below this oftener than it rises above it. The Early Amber Cane is superior to the Chinese sorghum, inasmuch as it ripens earlier and furnishes better sirup.

Industrial Implements.

PORTER'S WOOD-TRACK CARRIER

PORTER'S Wood-Track Carrier, of which we give an illustration, is light, strong and durable. It runs on four rollers that work with the least amount of friction, as they travel to and fro over 2½x3½ timber. The "stop" may be placed at any point on the track, and the



construction admits loading either within or from the outside of the barn. The implement as will be seen, is not intricate; there is little to get out of repair; it cannot jump the track, and being made carefully of selected material, it will be found to meet all reasonable demands satisfactorily. Mr. J. E. Porter, of Ottawa Ill., makes an extended line of haying machinery which he would like to submit to the judgment of our readers. Circulars will be sent on application.

METALLIC SHINGLES.

OF the accompanying engravings, Fig. 1 represents the form of an improved metallic shingle, which, when alternately laid, overlaps so as to form a double and water-tight metallic and therefore fire-proof roof. The method of this overlapping is represented in Fig. 2. It is easily seen from these figures that the point of each shingle is held down by the slot or projection at the shoulder of the two shingles of the next course below, while the elevated ridges fit into one another. It will also be seen that the point E of the shingle in each course passes under the raised projection H made for it in the next course below, while the corrugated edge A fits over the corresponding corrugation B in the body of the shingle, and is securely held in place by the point E in the projection H, and also by the manner of nailing, it is impossible for storms to beat under while the point E being settled down, the thickness of the iron fits closely on the central rib of the shingle underneath it. Thus the roof is storm-proof, as the shingles lie closer, have a full three-inch lap, and are fitted to one another. The edge C of the shingle fits closely to the central rib D, while the upper corner of the shingle J, being flattened, serves as an additional guide in laying the roof, as the shingles touch loosely when rightly laid. The corrugation I serves to strengthen and stiffen the shingle. The pitch may be the same as for slate or ordinary shingle roofs, but two inches to the foot are sufficient.

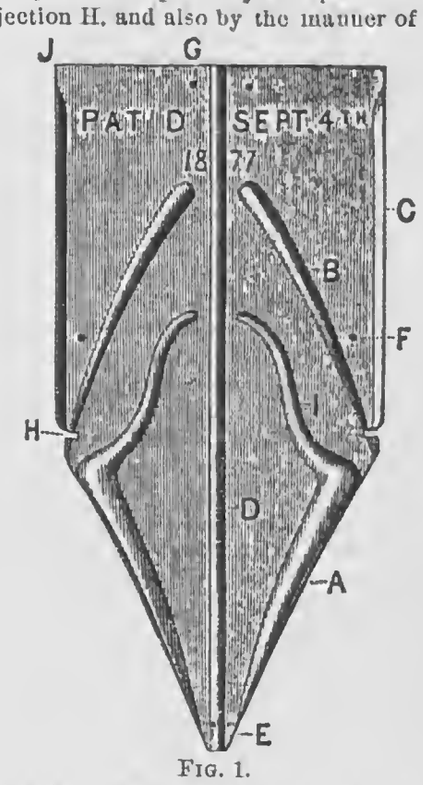


FIG. 1.

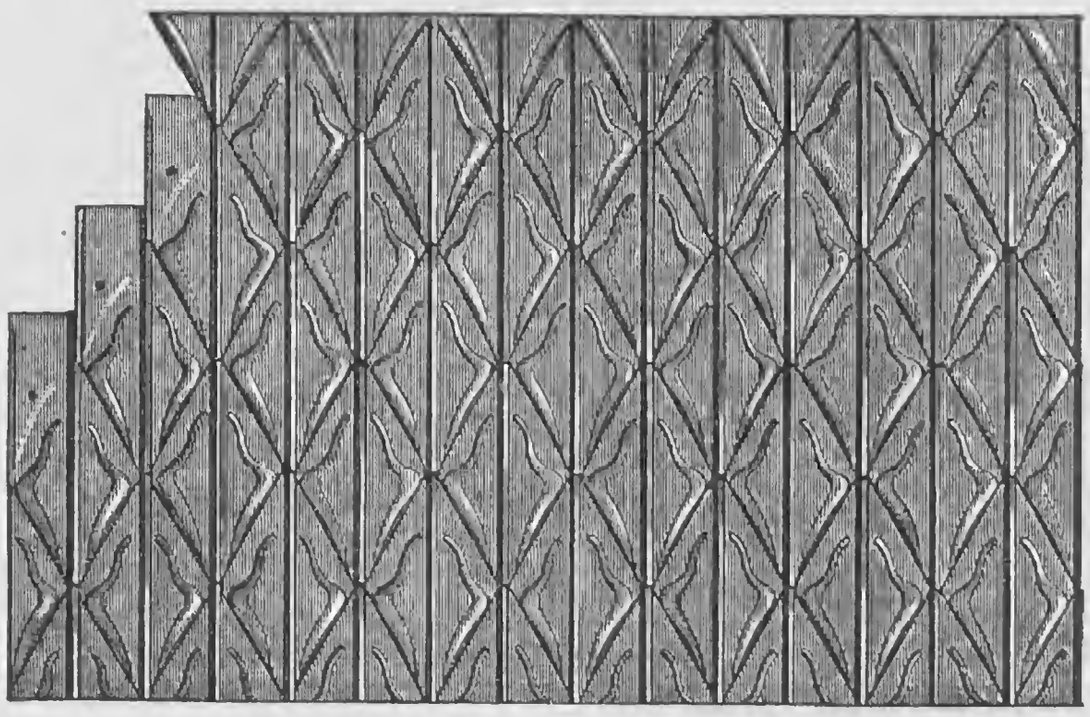

FIG. 2.

The advantages of such a roof over slate are that it is lighter; being less than one-fourth the weight of an ordinary slate roof, it allows the use of much lighter roof-timbers, and produces much less strain on the frame of the building. It is made of wrought metal, and readily adapts itself to the formation of the roof without breaking, and from the peculiarity of its construction, lies much tighter and closer. It is more thoroughly fire-proof. If slate be heated by fire in an adjoining building, it flies into pieces, leaving the building exposed, and this is especially the case if water is thrown upon it while hot. This shingle, being of wrought metal, will not crack or come off, but immediately cools when water is thrown upon it, thus continuing its protection to the building. It will not crack from the action of frost, nor will the nail-holes become worn and broken from the action of heavy winds; neither will it break from the falling of any weight upon it. It requires no solder in laying, as does a tin roof, and, being of thicker and heavier material, will last as long as the building.

The shingles are made of iron and prepared for use in two ways: One is by covering them before they leave the factory with a coat of metallic paint. Experience has shown that they will not rust on the under side, nor in the laps, and if, when they are laid, they receive a coat of paint, to make good any scratches that may have occurred to them while laying them, they will last for years without further expense. An occasional coat of paint will keep this roof in perfect order. They are also made "calamined," a process similar to galvanizing; it is the result of long and patient study and experiment, and is now made public after having been thoroughly tested under varying circumstances, and always with the very best results.

These slates or shingles will not rust; they will stand exposure to the weather on our seaboard, or in any climate, and give entire satisfaction. Iron coated with this composition has been put on trial with galvanized, tinned, and leaded iron, and in every instance the last three have given way and begun to rust, while the calamined shingles have shown no indication of corrosion. A roof covered with these slates or shingles will cost nothing for repairs or painting, unless it is desired to paint them for the sake of color.

The size of each slate or shingle is 8¼x16 inches; a square is enough to cover 100 square feet of roof, or a space 10x10 feet. They are packed in cases for transportation, one square in a case, weighing 140 pounds, and shipped at the lowest freight rates.

The paint is made of well-known and approved material, dries quickly, and will not wash off in storms, or in any way taint or discolor cistern water.

The shingles are in first cost almost as cheap as the usual kind, while the protection afforded against fire, their durability, and attractive appearance, make them the most desirable roofing that has been yet offered to farmers.

The above described shingles and paint are made by the Iron-Clad Manufacturing Company, of Greenpoint Avenue, Brooklyn (E. D.), N. Y.

The Querist.

ANSWERS TO CORRESPONDENTS.

Tobacco Culture in the South.

A Subscriber, Dalton, N. C., being a newcomer there, asks how to cultivate and cure tobacco in that section.

ANS.—The cultivation of tobacco materially differs in different sections of the country. In those States where the cigar tobacco is cultivated, it is the universal practice to make as many pounds per acre as possible. Heavy manuring is the only road to success. Not so where the fancy Gold-Leaf is produced. Not more than six hundred pounds per acre can be made, if the color and texture are retained. If more than this grows, it is too coarse. Furthermore, the finest tobacco of this class is grown on virgin soil without manure. The first step in making a tobacco crop of any kind, is to secure a full supply of early, vigorous plants. This can only be done by taking pains and by exercising judgment in the selection of the land and locality. The plant beds must be in warm places protected from cold north winds.

The preparation of the land must also be done with great care. In fact no crop, and no tobacco crop especially, will admit of slip-shod work. The planting should be done by the first of June and the cultivation should be thorough at every stage. The crop should be topped as it comes in, to eight and ten leaves, as the plant will admit, taking care to prune off the bottom leaves some three inches from the ground.

The crop should be "suckered" and "wormed" at least once a week. Take care that none of the worms or suckers get a start. A flock of turkeys will earn good wages in keeping the worms down. The gathering should commence as soon as the crop matures. Do not go about this in a hurry. Take pains not to bruise or tear the tobacco to pieces. Much is lost at this stage by carelessness. Handle it just as if it were silk.

The different methods of curing are so numerous as not to admit of their being described in a newspaper article. The fancy Gold-Leaf is cured by artificial heat graded by a thermometer which is always kept in the house where the tobacco is cured. The success at this stage is very uncertain to one who does not know how to proceed. It is doubtful whether the fancy wrapper can be made further north than Virginia, Kentucky and Missouri. This however, is not quite certain. The subject of tobacco culture and curing is too extensive to admit of adequate treatment in a brief article such as can alone find admittance here. A full account of the entire matter appeared on pages 486, 518, 538, 550 and 663 of RURAL for 1878. An excellent pamphlet of 27 pages on the matter will be sent *gratis* to our friends by our contributor S. C. Shelton, Ashville, N. C.

Removing an Obstruction in a Cow's Teat.

B. B. K., Fort Wayne, Ind., has a fine butter cow, one of whose teats was useless last season on account of a hard obstruction therein; and he asks what caused it, and how to remove it.

ANS.—Obstructions in cows' teats are by no means uncommon, especially among young animals. The trouble is supposed to result, in many cases, from an improper drying off of the cows in the fall, or from neglect in milking clean. Particles of coagulated milk are arrested in the milk duct, a tissue forms about this matter and adheres to the walls of the passage, in time entirely closing the duct. There are probably other causes, but these are supposed to be the most common. The only remedy is to break through the obstruction so as to unite the two portions of the milk duct, which have been separated by the obstacle. An instrument has been manufactured especially for this purpose. It consists of a small, round tube, inclosing either a double-edged knife or four blades at right angles to each other. The tube, or sheath, is pushed up the orifice of the teat until it reaches the knot, when the blades are pushed out of the sheath, cutting through the obstacle and re-establishing a connection between the parts, for the passage of the milk. Care is imperative to avoid cutting through the walls of the milk duct, and thus causing inflammation of the teat and udder, which might permanently injure the cow for milk. For a few days after the operation it is often necessary at milking time to use the tube—the knife having been taken out—by working it gently up the duct of the teat and through the opening made in the obstruction, in this way keeping it open until the parts are healed. Such obstructions are sometimes removed by using a large knitting-needle, with the point sharpened, to cut through the obstruction; but the operation is a risky one, and many cows have been completely spoiled for milk by an unskillful attempt to remove obstructions in the teats.

Tomatoes on Trellises, etc.

O. T., Millersville, Ohio, says: "In speaking of the Pinus edulis you said: 'Plant in pots an inch deep and plunge into the ground as soon as the rosette of needle leaves appears,'" and he asks whether it is the pot, plant or seed that is to be plunged into the ground; 2, what becomes of the seeds raised on the Department of Agriculture's Experimental Grounds at Washington; 3, will tomato vines run up a trellis like any running vine; 4, in a late RURAL it was said that a yearly volume of it could be bound here for $1 50, and he inquires whether express charges are included in that sum.

ANS.—1. You may plunge the pot into the soil up to the rim and keep it watered, or thump its contents out and plant the same as if it were a tomato. In the first instance, it would be easier to take up the plant in the fall if it were desired to keep it in the house. It would then be already potted, without any disturbance of the roots. 2. The seeds are given to Congressmen and sent to many different centers for general distribution. 3. It will not "run" at all. The vines or stems must be tied to the trellis. It is best to pinch out the shoots so as to direct the strength of the plant to several *main* stems, which may be trained directly up the trellis, which (in this case) is placed directly *over* it. We hope you will give the plan a good trial and let us know how it pleases you. 4. No. That is the bookbinder's lowest price for the style of binding.

Malt Sprouts.

The explanation given as to what malt sprouts are, in the RURAL last week, is not exactly correct. They are really the rootlets, and the plumule, or sprout, which appear in the first process of germination which occurs in malting barley. In making malt, the barley is steeped in water and spread in a layer a few inches deep in a warm room until germination occurs. When this has advanced up to a certain point, which is when the starch of the grain has in large part changed to sugar—and this is the object of the process—the sprouted grain is spread to dry on the floor of a kiln, which is heated from below. Here it is repeatedly stirred and shoveled over until it is dry, when the sprouts fall off or are broken off by the friction. The malt is screened and the sprouts become a waste product. As they contain much nutriment they are a valuable article of food for milch cows, or ewes suckling lambs. They contain as follows:

Water	8 per cent.
Mineral Matter	6.8 " "
Albuminoids	23.0 " "
Carbohydrates	44.7 " "
Woody Fiber	17.5 " "
	100.00

In the carbohydrates is included 2½ per cent of oil or fat. Linseed cake contains 28.3 per cent of albuminoids and 41.3 per cent of carbohydrates of which 10 per cent is fat. It will be noticed that malt sprouts have nothing to do with brewing. The brewers' waste is called "grains" and these are the crushed malt (and corn) which have been infused to make the wort or the liquor which becomes beer when fermented.

Twin Fruit.

W. L. H., Lebanon, Ohio, asks why half of a certain seedling apple tree bears twin fruit annually.

ANS.—We can no more answer this question than we can the question why a plant bears fruit at all. That two apples should grow together is no more singular than that two branches, two peduncles, two leaves, two roots, two tubers, two flowers (corollas), two petals or two carpels should grow together. And examples of the above are often enough met with by those who search for them. The formation of twin apples is owing to the fact that two calyxes or receptacles (whichever theory is preferred) cohere. A longitudinal section shows the ovaries to be distinct. Botanically speaking, the edible portion of the apple is not the fruit, which term is confined to the matured carpels, and as the ovaries are within the calyx tube (inferior), we do not see how twin apples, or any other rosaceous fruit with inferior ovaries, could become twins except by the coherence of the calyxes.

Blind Staggers in a Horse.

J. W. L., Rocky Hill Station, Ky., asks about blind staggers in a horse.

ANS.—Blind staggers is a very indefinite term applied to very different disorders. It may mean vertigo or megrims, sometimes caused by too rich feed and at other times by the collar compressing the veins of the neck and hindering the return of blood from the head. In some parts of the country, especially in the South, a disease is generally meant which consists essentially of congestion of the brain or spinal cord, and in regard to the causes of which little is known, as no competent practitioners have ever studied it. The symptoms generally mentioned in connection with it, might result from overloaded stomach, from impure water, disease of the liver, &c. As treatment of the latter form, give a good purge (five to six drachms of Barbadoes aloes) and follow with one-half ounce each of bromide and nitrate of potassa three times a day till improvement results.

Applying Liquid Manure.

A Subscriber, Keefer's Corners, N. Y., asks how to use liquid manure in a garden, on grass land and about young plants; how strong may it be for grass seed just sown for a lawn.

ANS.—In applying liquid manure to large areas a watering-cart, like those used to water streets in cities, may be employed. For smaller areas and about plants, a watering-pot or other small apparatus would be more convenient. The liquid should be diluted to the color of ordinary tea before application. It is a trifle troublesome to liquify sheep, hen, or other manure, but there is no doubt but that it is the best form in which to apply manure to grass lands and in the garden. It would be well to draw away the earth from about the roots of the plants, apply the liquid manure, and when it has soaked away, replace the earth. It should be used only on growing plants; for if employed when plants are checked by drought, it will be injurious. A couple of times a week is quite often enough to apply it.

Planting Our Corn Gift.

H. C. B., Waldron, Ark., thinks that the amount of corn received by him is not large enough to plant thirty-three feet square of ground, and inquires whether he can use his own judgment as regards the area to be planted, or is it necessary to plant the entire plot.

ANS.—We have a plan to secure justice to all who compete for corn prizes, that it is best we should not make known. Our object is to be able to *detect* any attempt at unfairness. We impose the condition that the corn we send must be planted within a plot thirty-three feet square. It will not answer that part be planted in *one* place, part in *another*. We do not care *how* much of the plot of thirty-three feet square is cultivated—only that the seed we send shall be planted *within* that area. As we have said before, each competitor must write us, when he sends his results, how many kernels he received and planted.

Abscess of the Gutteral Pouches in a Horse.

B. G, J., Decatur, Ill., asks for some cure for a horse that for more than a year has been troubled with a cough and often discharges phlegm from his nostrils, especially when drinking.

ANS.—As near as we can judge, the horse has what is known as *abscess of the gutteral pouches*. Turn him to grass, and always feed from the ground so that the discharge will find its way out of the pouches. As medical treatment the following may prove useful: Take sulphate of iron and gentian root, of each five ounces, bicarbonate of soda, one ounce, iodide of potassa, one and one-fourth ounce. Have these well powdered and mixed, and divide into twenty powders and give one twice daily. If this does not succeed, the pouches will probably have to be opened by a surgical operation which only a *first-class* operator can safely perform.

Keeping Horse Manure.

A Long Island Farmer, has a large pile of horse manure and asks how to prevent it from being burnt up by overheating, until wanted.

ANS.—Horse manure that is free from litter needs the most careful management to prevent dry rot, or what is known as fire-fanging. This is occasioned by the evaporation of the moisture by the heat of the fermentation. The drying up of the water carries off all the ammonia that has been formed, and has been dissolved by it. The consequence is that burned, or fire-fanged, manure is nearly worthless. To prevent this injury it is necessary to pile the manure in flat heaps, out-of-doors, where it can receive the rain or be watered when necessary, and to trample or pack it down very tightly; it should then be turned over occasionally and repacked again as solidly as possible. When managed in this way the manure is kept in the best condition and retains all its valuable qualities.

An Injured Frog in a Horse.

W. M. K., Washington, D. C., has a horse made lame in the foot through the blacksmith's ignorance or stupidity in paring away the frog, so that it has become hard, dry and a little cracked, and he asks for a remedy.

ANS.—The condition of the frog which our correspondent mentions, would scarcely, of itself, produce lameness, and we presume the foot has sustained some injury that has escaped his observation. We would advise the removal of the shoe and a careful examination for the seat of the disease. A coating of warm wood tar, by preventing evaporation and softening the horn, will assist to restore the frog, but this part should never be touched with the knife in shoeing. It is impossible for us to give fuller information without a more definite description of the nature of the disease.

Miscellaneous.

L. M. P. Indianapolis, Ind., says: "The RURAL has very kindly and satisfactorily replied to several of my inquiries so that I am not without hope that it will indulge me in still another favor [It is a pleasure. EDS.] A friend of mine has given me a few seeds of what we, for want of a "real" name, call a *Choice Vine*. She has consulted a botanist in the city, but the vine is a stranger to him, and I come to you for a name. Your circle of acquaintances among flowers and vines is so extensive that I shall be greatly pleased if the following description and inclosed seed be sufficient to suggest the name: The vine is hardy; grows to the hight of six feet or more; has foliage something like the Passion Vine; particularly are the textures alike. The blossom appears in July, and then follows a green ball, probably a half inch in diameter, covered with seeds, to each of which is attached a plume an inch and a half long. When the blossom first comes, it is small and green; as it approaches maturity it becomes larger and white; when fully ripe it is grayish-white.

Father received the vegetable and flower seeds and corn package, for which we thank you. I say *we* for the flower seeds he handed over to my care. I have already sowed most of them in a hot-bed, *all my own*. Am anticipating great pleasure from my flowers this summer. I shall make seedling Geraniums a specialty. I have a great admiration for the Glaucium you sent me last summer. But, unfortunately, I have but one plant remaining. Your article in the RURAL last fall stating that it was a *hardy* plant, did not appear until after I had secured mine safely (as I supposed) in the cellar—all but the one mentioned above which I left in the garden as an *experiment*. Those that I took up *all died*. I shall guard the living one very carefully, hoping to increase my stock therefrom."

ANS.—The seed is that of a Clematis—perhaps C. Virginiana. Perhaps you may desire to send us a flower when it blooms, in which case we could tell positively as to the *species*. C. Virginiana blooms July-August. We hope that you may have success in your seedling pelargonium culture. Probably you know that the flowers are easily crossed. It is better to cross them than to raise seeds indiscriminately, as one can then select parents and produce a larger proportion of desirable seedlings. At least that has been our experience. You will observe that the pollen and pistil of any particular flower do not ripen simultaneously.

D. H., New Milford, Pa., asks, 1, where can he buy Holstein cattle at a reasonable price; 2, if apple and pear trees make a long growth the first year, should they be cut back before the next, and if so, how much.

ANS.—1, Smith & Powell, Syracuse, N. Y., advertise Holsteins in the RURAL, and are a reliable firm; 2. it will depend much upon the natural strength of the variety, and upon the form in which the trees are to be trained. As a general thing it is well to cut off about half or two-thirds of the young shoots, and always cut them over a bud that points in the direction in which the branch is desired to grow.

E. P. F., Farisville, Ks., asks, 1, whether the White Prolific corn advertised in the RURAL by J. M. Thorburn & Co. is the same as that distributed by the RURAL; 2, whether hen manure put on top of a corn-hill would be beneficial, and if so, how much should be used on each hill; as corn there is planted with a two-horse corn-planter, the hen droppings cannot be put in the hill.

ANS.—Yes; as already explained in these pages, the RURAL sold its surplus corn to the above firm; 2, yes, a handful scattered on the hill would be enough in most cases.

M. S. C., Pekin, N. Y., has an English Ivy three yards long in a five-inch pot, and she asks 1, if it should be repotted this spring; 2, her purple Fuschia looks dead, except thrifty, little shoots which come out from the main stalks; is there any cure?

ANS.—1. A pot a size larger will do no harm. 2. There is nothing very alarming in this case. Part of the top of Fuchsias often dies away during the winter rest. Give it fresh earth and cut it back to the young shoots.

E. S. McN.—no address—asks what to mix with harness oil to prevent mice from destroying the harness.

ANS.—By mixing bitter aloes, or jalap in powder with the oil, the mice will be deterred from gnawing the harness or else they will be so physicked that they will never repeat the mischief. The strong, disagreeable smell of these drugs repels the mice.

O. W. F., Blackstone, Mass., asks if he planted pearl millet from the first to the middle of May, whether he could get a crop for hay and another later one for seed.

ANS.—Pearl millet will not seed north of Virginia to any extent. It will not seed at all in the above latitude unless planted in the house or under glass.

Mrs. H. de B. K., Philadelphia, Pa., asks where she can get "Kidney Potatoes."

ANS.—*Kidney* has reference to shape only. A large number of varieties are called Kidney Potatoes. They can be had of any seedsman.

B. F. W., Cambria, N. Y., asks where can he obtain Norway Oats for seed.

ANS.—From B. K. Bliss & Co., 34 Barclay street; J. M. Thorburn & Co., 15 John street, New York.

M. W., Poquonock Bridge, Conn., has a bulb Maderia Vine and, wishing to put it out in

different places, she asks whether the sets can be separated for planting as one cuts a potato.

ANS.—Yes.

J. C. C., no address, asks where can he get stencil tools for cutting his name on plates.

ANS.—Of W. F. Hyatt, 230 Beekman street, or of the Stafford Manufacturing Company, 66 Fulton street, this city.

J. A. S., Gallatin, Mo. As nearly as we can make out from specimen, it is a narrow-leaved variety of Arbor-vitæ. Send us a sprig of this spring's growth, please, when made.

C. M., Colinville, P. O., Ontario.—We cannot tell from the seed what the variety of Lettuce is. We will sow some of it and let you know.

The Poultry Yard.

OUR CHICKENS.

MRS. M. G. RAND.

WE do not keep poultry for profit, as our home is on ground purchased by the foot—not by the acre. It is a *habit* with us to keep chickens, and one we would give up reluctantly, for it is a pleasure to see them about and to attend to their wants.

The poultry-house is twelve feet square, and is never occupied by more than eight or ten fowls at one time. It fronts east, and that side of the coop is nearly all glass. The chickens look very comfortable in their pleasant quarters, and when on the perches they always *face* the window, which proves that they like a cheerful outlook.

Our chickens are regularly fed, principally on wheat and corn, and pure water is always before them. The drinking dish is scrubbed with suds and a stiff brush two or three times every week. A common flower-pot saucer, holding a quart or more, makes a good drinking vessel for chickens. Invert a small flower-pot in the saucer, which will leave room at the edge for the chickens to drink with ease. Such an arrangement prevents the fowls from running through the water. Shallow boxes of air-slaked lime, ashes and gravel, are kept in the coop and renewed often. The perches are washed occasionally with alum-water, and the ends rubbed with coal oil.

When wishing to set a hen, we take a box of suitable size for the nest which is made of clean straw, and sprinkled with sulphur. During the time of incubation, we avoid disturbing the hen, in order to indulge her natural inclination to privacy. Her food while sitting consists of wheat and corn-meal wet with water. The little chickens are not fed until twenty-four hours old, and then on coarse corn-meal. If they are kept in a small coop on the ground, it is moved along a few inches every day or two, to give them a clean place. It is well to open the coop entirely, late each afternoon, to allow the hen to roam at large for an hour, to scratch for the chicks. Food ought not to be left near the coop over-night, lest rats be attracted to it.

Fowls that have to be confined in summer, on account of the garden, should have a yard attached to the coop to run in, and a daily supply of green food and raw meat. A spadeful of earth and a green sod now and then, will give them something to do.

If the poultry-keeper does not wish the hens to sit, they should be put in a small, but comfortable coop for the day, and back on the roost at night. Persevere in this plan *patiently* until the hen is over the "notion." There is no necessity for the cruel practices of some persons in regard to sitting hens. Another lack of humanity is often shown in allowing poultry to go without water in winter, because there may be snow on the ground. The man who is guilty of such neglect, might try *snow* as a substitute for tea and coffee. At all seasons pure water and plenty of it, should be kept within reach of the poultry.

During the molting process fowls need the best of care, as it is a great tax upon their strength to get new plumage. Give raw beef as often as they will eat it, and keep a rusty nail, or any bit of iron, in their water-dish.

We have kept several varieties of fowls, but our preference thus far is for the Light Brahma. We are never without a trio of White Bantams; the dainty little creatures look so pretty on the lawn and are so useful among the flowers, that we could not consent to give them up. It is said that a "sentimental idea prevails that Bantams do no harm." Our experience satisfies us that a few do more good than harm. If allowed among the verbena beds, the flowers will not be destroyed by the cut-worm so troublesome in the month of June. Every family that can do so, should keep a pair of Bantams for the children, but never wound their feelings by serving up their pets for dinner. Sooner keep them until they die of old age. We never find it difficult to get good homes for our surplus Bantams.

There has seldom been a case of sickness among our chickens, owing probably to the regular care they receive, feeding, etc. The poultry-house is so constructed that it is ventilated all the time, without the currents of air reaching the fowls directly. Chickens are not apt to suffer from disease unless neglected. One of the many results of neglect is parasites on the legs. If remedies are not used in time, the fowl becomes unable to stand. The cure is turpentine and sweet oil, equal parts, applied to the scales of the legs. For this trouble turpentine alone is often recommended, but it is too strong, and no more effectual than when mixed with olive oil. So much has been written on poultry that it would seem as if nothing new could be said on the subject to enlighten any one. However, those who engage in poultry-raising naturally like to know something of each other's experience.

Clinton Co., Iowa.

RAISING GEESE.

WHY is the interest in raising geese so small? How can a poultry yard be complete without them? I raised three broods of goslings from one goose last year. The same goose has laid 32 eggs this year. Her time for hatching the second setting is up now. The first setting was destroyed by a new man on my farm, who shook the eggs, thinking they were addled, not knowing that they need four days longer than usual in December and January. Goslings raised last July are hatching now. Every batch of four geese should have one gander with them. I find that when there is only one gander to six geese there are too many infertile eggs. I've had only two eggs of that sort that failed to be detected by testing, since I began keeping geese. My geese are of a pure breed—grayish-brown, knuckle-billed Chinese birds, with large bodies. I consider them a profitable addition to the poultry yard. Unlike the Toulouse and white geese, they are not roamers.

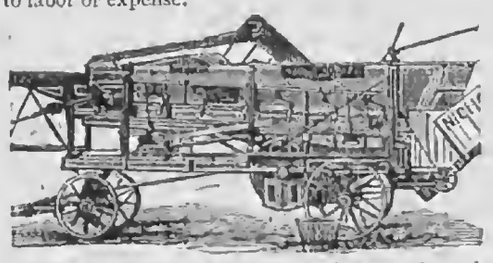
NICHOLS, SHEPARD & CO.,
Battle Creek, Mich.
ORIGINAL AND ONLY GENUINE
"VIBRATOR" THRESHING MACHINERY.

WE are sometimes asked why the prices of our goods are apparently higher than some others of inferior make, and we avail ourselves of this opportunity to place the matter in its true light.

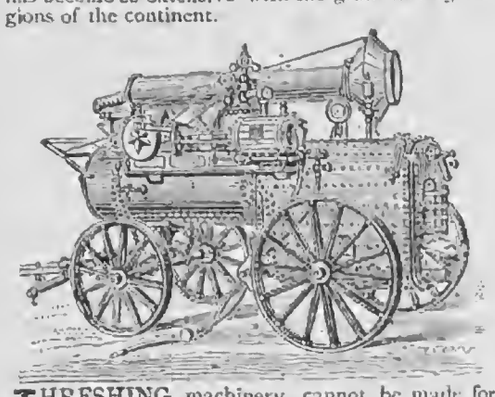
OUR "VIBRATOR" Threshers and Portable Engines embody the best results of our experience and study during our long business career. Whatever would add to their durability, efficiency, and solid excellence, in any particular, has been eagerly seized upon and utilized without regard to labor or expense.



IN this connection it will be pertinent and timely to warn the public against **Cheap** Threshers and **Cheap** Portable Engines. The superiority of our machinery, in all particulars, is now so generally acknowledged that our competitors have no resource but to present the attraction of low prices and long credit. Their goods being inferior, they have to sell them for what they can get. Times are hard; and purchasers, without fully considering the subject, will sometimes allow a lower price to decide them. Manufacturers of "cheap" machines are so set on carrying out competion to its utmost—competition of **Cheapness,** not of Excellence—that they meet "bargain hunters" half way, and furnish them cheerfully with inferior machines at the cheap rate they are asked for.

WE are much mistaken if this is what the public wants or expects of us. Good machinery cannot be made when neither workman nor employer has pride in his occupation; interest and pleasure in the work are both wanting, and both are essential in making good machinery.

OUR mission and business is, to build Threshing Machinery **of the Highest Excellence,** whatever the cost, and, holding firmly to this single purpose, we have added improvement after improvement, until the reputation of our Machines has become co-extensive with the grain-raising regions of the continent.



THRESHING machinery cannot be made for nothing, even with the aid of machinery. Our prices are as low as they ought to be, and, without doubt, as low as they ever will be. Do not be deceived with mere cheapness—**quality always descends faster than price.** Low price, especially in Threshers and Portable Engines, means **Low Quality, with Low Performance and High Repairs.**

THE WAY TO MAKE FARMERS.

JOURNALS "devoted to the interests of country homes" can do no better service than that of inspiring a love for plant life in the hearts of those upon whom the future of the farm depends, namely, the children. It has often seemed to us that children are, in many instances, sickened of farm life because they are required by their parents to do work in which they cannot interest themselves; work which they dread to begin and are glad to end. It is not, indeed, in the nature of children to like work that has no attraction. It is to them synonymous with punishment to the extent that it conflicts with their inclinations. It is not in the nature of any living creature to be pleased with an arduous employment which brings with it no sort of compensation, not even the satisfaction which love for the work insures. Now, if we desire to educate a child, so as to inspire him with a fondness for a special pursuit, we must show that its reward will amply compensate him for the study and labor which it involves. That there is a bright side to farm life none can dispute. That farming or horticulture, if rightly pursued, will—in this country at least—secure to the farmer or horticulturist an ample reward, admits of no manner of doubt. Our object is so to present these occupations to farmers' children in so true a light that they shall have before their eyes the bright side, the reward, instead of the forbidding impressions which naturally arise while performing the hard and dreary work which unthinking parents too often impose.

It has occurred to us that the formation of a "Youths' Horticultural Club" might prove a step in the right direction. First, we would induce the children of our readers to arrange and plant a little garden of flowers, vegetables or small fruits. It matters not how small the beginning. This first garden need be no larger than a hoop. Success with a single strawberry or grape vine, with a single cabbage, tomato, or flower of any kind, would encourage another trial, while failure from attempting too much would, perhaps, discourage from further attempts. In these first trials we seek, first, to amuse the child, and through the amusement to instruct in such a way that amusement and instruction shall finally render all necessary work a labor of love.

In the Youths' Department, as conducted by Uncle MARK, we propose to offer simple, seasonable suggestions in gardening and elementary botanical teachings, in the hope that with many of our young friends a desire to know something of the structure of plants, how they grow, and how best to make them grow, shall manifest itself as the natural consequence. Every spring and fall we receive hundreds of plants, which are sent to be tested in the Experiment Grounds connected with this journal. Of course, as these grounds are already well filled, older plants must be removed to make room for the new ones. Should the Youths' Horticultural Club meet with general approval, we shall be very happy to distribute these plants from time to time (without charge, of course,) among those of the members who seem the most enterprising and deserving, and also to provide them with several varieties of choice seeds every spring.

We now put the questions to parents: "Do you approve of this plan? Do you believe that it is calculated to prove of any real benefit to your children, either simply as an innocent pastime or as possibly influencing them to a higher and more intelligent appreciation of the orchard, garden and farm?" If so, we should ask that you assist us in the carrying out of this plan. We should ask you to explain it to your children; to provide for them a little plat of ground and anything else they may need, such as a watering pot and a small spade and rake. We should hope, in short, that you would take an interest in their work, and even put yourselves out to encourage them in their efforts; assist them in writing to us of what they attempted, how they succeeded or failed.

Finally, all who write for the RURAL might assist in rendering this instructive and entertaining to both old and young, by contributing any notes or suggestions which occur to them. All communications on this subject should be addressed to Uncle Mark, and the names of would-be members should be sent in at once. He will superintend the registry of names, answer all letters that require answers, and promptly attend to the awarding of premiums.

JAPANESE MAPLES.

NOVELTIES are the order of the day. Much of our lives is spent in seeking them. For many of us, indeed, novelty alone affords amusement. Time-worn objects and methods are looked upon with indifferent eyes. As a result of this tendency of the age, we find horticulture also striving for variety of effect. The production of marvels and monstrosities of the propagator's art is of almost daily occurrence. The papers herald them, and chromos emblazon their charms for a presumably delighted world. Naturally, however, some of us become satiated by this *embaras de richesse* and look somewhat askance at all new plants.

We know, indeed, how good some of the old ones are, and remember, moreover, sundry dire disappointments with the new. We confess, for instance, that on first having our attention drawn to Japanese Maples, two or three years ago, our appreciation of their beauty was modified by the consideration that it was not possible that such delicate forms and colors could stand the rigorous changes of American seasons. We fancied the summer alone would scorch their delicate leaves. However, we tried one or two, though the price was high, and soon learned to estimate more fairly their excellent qualities. One, the Sanguineum, had the richest red purple hues in summer we had ever seen. Others were cut and divided into the most fantastic shreds of delicate tissue, rainbow-dyed in color. Again, specimens were shown us so dwarf, as to scarcely reach three feet in a score of years, while others, if well-established, would some seasons grow a foot or more. The leaves in one case were small, almost minute, in another broad and round, suffused with golden shadings in the most exquisite manner. Nature had outdone herself in creating what are technically called "sports." We also began to discover that these seemingly delicate little plants were rugged and tough as an Oak—tougher than some Oaks. Then they were not mere variations of well-known old forms of Roses, Geraniums, and the like. On the contrary, they bade fair to constitute a positively new feature for the lawn. They were not shrubs, but regular dwarf trees with as much of the tree-like development as the Scarlet Maple, only in miniature fashion. This, with their wonderful hues and forms mingling in diverse manner on every leaf, we began to realize, must in time win for them a very distinguished and unique character.

On investigation we found there were a score or more varieties very many of them belonging to the polymorphum species, but others distinctand peculiar types in themselves. All of them, we learned, were very difficult to propagate for various reasons, and some some, as far as we could hear, had not been reproduced out of Japan, except perhaps from seed. The method of propagating variegated-leaved plants by seed is not really satisfactory, as all experts know, on account of the divergence from the original type that is ever apt to occur. Grafting is evidently the true method. We found, in fact, that Japan, in sending her Maples to us, has really much increased the obligations we already owed her for many valuable hardy plants. We felt that in Japanese Maples existed qualities to be developed by combination of colors and otherwise, that might do much to disenthrall us from the overpowering and ubiquitous ribbon planting of the day. Fancy easily pictured beautiful effects of color varied to the utmost, and devoid of all crudity produced by tasteful arrangement of these Maples on the lawn.

It will be readily inferred from the above remarks that our conversion to a belief in horticultural novelties like Japanese Maples, was complete. We do not know but we were betrayed into the weakness of terming them "little beauties" in certain instances. Well, we intend to make up for this lapse into excessive enthusiasm for a new thing by renewed vigilance in recognizing weaknesses in other novelties. Or, rather, should we not say that while we hail with delight a really fine "new plant," the innumerable novelties having few distinctly valuable and differing qualties, must be relegated to the more or less obscure positions where there they belong.

GOOD HORSES—POOR ROADS.

Now that we have got the country so well railroaded, is it not time to put some work, money and "gumption" into the building of our highways upon improved principles, so that we may have permanent, smooth level tracks upon which to draw our loads and drive our nice horses and carriages? We are decidedly of the opinion that our farming towns will find smooth, dry roads, with moderate grades, worth as much to them in money, to say nothing of pleasure and comfort, as the railroad connections for which they have been so anxious, and for which many of them have been so profusely taxed. No country in the world has such good driving horses as ours, but, save in our village streets, no country in Christendom has so few places where they can be driven at a good pace with comfort and safety. And a village street is the "wrongest" place of all for rapid driving.

But, in order to have good roads, we must employ men to plan and superintend them, who understand the business. This ought not to be extremely costly at this time. Our scientific schools and colleges have of late turned out a good many graduates in their civil engineering courses—far more than have been able to fine employment. They ought to be able and willing, and doubtless are, to show about home their skill in their business at a moderate compensation. Give them a chance to do this, and it will encourage others to take up the study. There ought to be, and would be if they could find business, a competent road builder upon scientific principles in every town in the country. And they ought to be, and would be, content to serve their fellow-citizens at a price equivalent to what is paid a minister or a teacher in the same community. The work now expended to a poor advantage for want of skillful direction upon our highways, would, when properly "bossed," make them as good again. The saving in the wear and tear of vehicles and teams, the larger loads that could be carried and the quicker trips that could be made, would very much more than pay the cost of skilled direction. Let the farmers think of this. It is worth while. It will lead to the most needed and most profitable improvement that can be made for the pleasure, comfort and profit of country living.

RURAL EDUCATION.

THERE is a necessity now for a higher grade of education in rural schools. For a few years past there has been a wonderful increase in the number of local journals, as well as in the circulation of special journals published in the large central cities. For one newspaper published a dozen or twenty years ago there are now ten; and for every reader of newspapers or other journals of that time, there are now twenty, if not more. The result of this kind of popular education—and a most valuable kind of education it is—has been to largely increase the stock of information, and to give scope to an immense energy of thought. Where formerly the plainest and most matter-of-fact information only could be received, now matter suggestive of original thought is sought for, and the popular mind is able to entertain and discuss many heretofore unapproachable questions.

It cannot be permitted that the education gained in the school should be of a lower grade than that picked up in the family circle or from papers and books. The school should lead in this respect, and should always be in advance of every other source of information. At no previous time in human history have science and practical industry made such enormous progress. In that respect a thousand years of the past have been as but one day now, and the probability is that the future will completely overshadow the present. Under these circumstances, the system of education needs to be of the most thorough kind. It is certainly true that the day has passed away forever when reading, writing and arithmetic should be thought sufficient knowledge for a farmer's boy. The farmer's boy of this day needs a far higher education than that.

HARDINESS OF PLANTS.

IT is generally understood that "rolling off a log" is one of the easiest things to do. But there is another thing just as easy. It is misjudging the hardiness of any plant. For instance: we have two Globe Arbor-vitæ transplanted at the same time, growing in the same soil and only ten feet apart. Both are exposed alike. One is half-killed by the past cold season—the other has not one leaf injured. If we had had *only* the former, we should have told our readers that "this variety is not hardy with us." If we had had only the latter, we should have said "this variety is hardy with us." It is the same with the common Hemlock. We have not less than thirty trees in various parts of our grounds. Some of them have not been harmed in the least. Others have been seriously harmed. In this case it is evident that those growing in moist soil have suffered the least—though of the others it is impossible to see why some should have been injured a good deal more than others. We might multiply instances. The fact is the word *hardy* is too generic to be of much service to us in conveying trustworthy information respecting the many influences which affect the vitality of plants during the wintry season.

BREVITIES.

HAS anybody ever raised fine Clairgeau pears upon the quince?

SOMEBODY has called the English sparrow "a dissolute, unmusical rover."

DR. WARDER praises the Celestia apple highly, and Mr. M. B. Bateham says he is right.

PROFESSOR CYRUS THOMAS will *not* go to the Agricultural Department in place of Professor Riley, as the papers have reported.

PINUS AYACAHUITE has stood the winter without injury. According to Messrs. Ellwanger & Barry this is not hardy in Rochester.

WE are obliged to say to those still intending to send us novelties to be tested, that we have all we can give proper attention to the present season.

"How to Bud in *Summer*" was the incorrect heading given to a question and answer in last week's issue. *Summer* ought to have been *spring*.

AT this busy season our "News" Department suffers once more from a press of other matter. In future, however, we shall try to give ample space to it.

WE have received a copy of the Report of the Michigan State Pomological Society for 1878. As usual it is brimming over with good things, to which we shall make a more extended reference hereafter.

MR. MANNING, the Secretary, tells us that the meeting of the American Pomological Society will be held in Rochester, this State, at the invitation of the Western New York Horticultural Society. The precise time, however, has not yet been decided upon.

A FRIEND who has had occasion to complain that the present season's small-fruit trade has been entirely *too* small, writes to us in the following affecting strain:

"Where, ah, where do the *trade* winds blow?
Not a tithe of what ought to, comes here I know.
There is a good deal of shopping done——
But *where* the buying is done deponent saith not!"

MR. S. B. PARSONS writes us: "Thanks for your complimentary remarks in Editorial Brevity of last issue. I fear I misunderstood your question. I thought you meant the two best hardy Roses. For Hybrid Perpetuals, my answer was not correct, as Mad. Plantier is a June Rose. Gen. Jacqueminot only is Hybrid Perpetual."

THE new Magnolia Halbana (stellata) is now blooming with us. It began to bloom the 21st of last month. The flowers bear about eighteen petals, white, with an occasional rose-tint, an inch and a half long and half an inch wide, and the fragrance is that of the Tuberose. The species is dwarf and bushy; blooms while but two or three years old, and is, at the "Rural Grounds," perfectly hardy.

IT'S an easy matter for readers of our "Everywhere" to learn what farming operations are under way in all parts of the country. Each reader has in this department greater advantages than if he had in each section friends who reported weekly to him on the subject nearest to his heart and pocket; for in the latter case he would have to puzzle occasionally over cramped handwriting, and often to read a good deal of miscellaneous matter, before finding the scattered items about farming; whereas all the choicest information is here culled from hundreds of letters and placed plainly before him in lucid print.

CORN MEETINGS OF FARMERS' CLUBS.—The late corn number of this journal seems to have been widely suggestive in more ways than one. We find that quite a number of farmers' clubs have set apart special meetings for discussing this topic, and there is certainly no subject more important, and no season of the year more timely. The Amer. Inst. Club of this city, at their last meeting, carried out the programme previously indicated, and ventilated this many-sided question in the presence of a numerous attendance. Pres. Heath, in his opening remarks, brought together the main points of interest with a clearness and brevity showing great power of condensation. Col. Henry, of Tenn., and other prominent agricultural men, took part in the debate, after which Mr. Conrad Wilson called attention to a method of field experiments more comprehensive and systematic than usual, and which evidently excited much interest in the audience. Mr. Wilson has given special attention to this line of investigation for many years, and he now presents his conclusions in a practical form and invites the scrutiny of practical men. After briefly explaining some general principles, and illustrating them on the blackboard, he proposed to enter more fully into the subject and to develop it more clearly at the next meeting. As the limit of time made it impossible then to go through and illustrate the chief points in the argument, this proposition was hailed with satisfaction. As we shall perhaps be able, in the next issue, to give to our readers a clearer statement of the subject, we prefer to present it then entire rather than offer an installment now.

Literary Miscellany.

AN UGLY GIRL.

(Continued from page 270.)

CHAPTER VIII.

SEARCHING THE TOWER.

ALTHOUGH accustomed from his boyhood to athletic exercises and not only agile, but courageous, Noel knew that the feats which are easy enough in the daylight are very difficult when undertaken in the darkness of the night, and with a rough wind to battle against. Even the mere steadying of the ladder by which he proposed to ascend was no easy matter. However, it was finally accomplished; and when he had succeeded in forcing an entrance through the casement on the first story of the building, the men below raised a feeble cheer. The sound was inspiriting, and he went boldly on although the clouds of dust continually eddying round, and his ignorance of his whereabouts almost bewildered him.

A few moments given to exploring the small circular chamber in which he found himself, and then he discovered a door leading to the staircase. It was on the side of the tower next to this that the gale had done most mischief. The outer wall was entirely gone, and in several places some of the steps above and below had been carried away, leaving wide gaps; and added to this the wind poured in through the fissure it had rent, whirling and roaring with a hideous noise that almost deafened him. Yet up this broken staircase was the only way to the chamber in which the lamp Miss Carisforde had lighted at twilight was still flickering. Whenever the gale abated, Noel shouted her name, then listened intently; but either he failed to make himself heard, or she was incapable of replying; yet the next minute the pitiful yelping of a dog faintly reached his ear, and he determined to proceed.

Fastening the lantern to his arm with a rope which one of the men had given him, he now commenced the ascent; taking every step cautiously, for the loosened stones were often dislodged by the slightest touch of his hand or foot. On and on he went, clinging close to some projection, as often as the fierce gusts threatened to hurl him from his exposed and perilous position, but never losing his presence of mind or growing faint-hearted and swinging himself at last to the landing at the head of the flight of stairs with a thankful ejaculation that he had achieved so much of his self-imposed task.

Two doors were now before him; the one yielded to his touch, but on entering, a chaotic scene presented itself. The heavy, antique roof, as well as the highest story of the building, had been dragged down with the fallen wall, and a heap of rubbish encumbered the floor of this chamber which, on the further side, was completely open to the air. Noel shuddered as he thought that the lonely girl he had come to seek might be lying at that moment buried beneath the confused mass of boards, tiles, and furniture on which he was gazing, and he summoned up courage to examine it as well as he was able; but no signs of her presence were to be found, and after calling again without eliciting any reply, except the faint yelp of the invisible dog which now seemed to be as far off as at first, he proceeded to the other door.

It was locked, but feeling that this was no time for studying outward observances, he did not hesitate to burst it open, and found himself in Miss Carisforde's dressing-room. It was here that the lamp burnt as steadily as the gusts to which a casement, shattered by the blast allowed free admission, would permit, but the lady who had tenanted the apartment so lately—one of whose gloves lay at his feet, and one of whose filmy handkerchiefs, steeped in tears, was on the table beside an open writing-desk—was not visible.

Again Noel vainly shouted her name, and then passed into the adjoining bed-chamber. The bed had not been occupied; strange to say, there were tokens to be seen on every side, that some one had been employed in packing for a journey. A small hand-bag, filled with toilet appendages, lay on a chair with a lady's waterproof and umbrella; the half-open drawers of the wardrobe appeared to have been hastily denuded of their contents; a trunk partially filled with books and drawing materials stood near the window, and the carpet was covered with valueless odds and ends generally disinterred at such times.

These things struck Noel with surprise, till he reminded himself that Carisforde Park would doubtless possess no charms for its young mistress, until she had shaken off her grief for the loss of her father, and that nothing could be more probable than that she was meditating a removal to some pleasant watering-place.

But the astonishment which these reflections were banishing returned, when, as he re-entered the dressing-room—satisfied that Miss Carisforde must have quitted the tower earlier in the evening—he happened to glance at the writing-desk already adverted to; for now he saw three or four letters—sealed with the Carisforde arms, and directed in a hand unusually legible for a lady's—lay upon it, and with them a hand-book. A second glance showed him that one of these letters was directed to himself.

What could this mean? He examined the other missives, and saw that they were for Mr. Whitely the solicitor, Mrs. Hurst, and the housekeeper. There was some mystery here which he could not fathom, and trimming the lamp, he tore open the letter addressed to himself.

"My cousin," it began, "you have not only been disappointed but wronged; your mother has told me so, and convinced me that it is my duty to repair the injustice with which my dear father, misled by his affection for me, has treated you. There is but one way in which I can do this, and that is by renouncing the wealth which, believe me, I never wished to possess. Lest you should in your unselfishness oppose my intentions, I am on this point of leaving Carisforde secretly, never to return. To you I resign all that can be called mine, *freely* and *cheerfully*; so do not hesitate to accept it. I shall be miles away before you receive this. I have stated my wishes to Mrs. Hurst and my servants; be good to them, I entreat you, and try to think kindly of ADA CARISFORDE.

Noel was profoundly affected by the few and simple words of this note; in what a pleasant light it placed the mental qualities of this much-to-be-pitied young creature! and how sad was the fate that had married such a noble mind to positive deformity of person! As he refolded the paper, he vowed that if she could be traced to the retreat to which only a few hours since she must have hurried, he would endeavor to win her esteem, and be to her the faithful friend she certainly deserved to possess. As to accepting her romantic renunciation of her rights to the Carisforde property, he knew very well that he could not do so, even had he wished it. The law would interfere to protect her from the impulses of her kindly heart; and he felt seriously angry with Mrs. Estcourt for having, by her silly, avaricious speeches, led her troubled auditor to rashly fly her home in this manner.

The war of elements, as well as the suspense of the servants who waited at the foot of the ladder were forgotten while Noel mused over Miss Carisforde's unhappy fate, and anathmatised Mrs. Estcourt for having driven her away. It was plainly to be seen that she had taken no one in the house in her confidence, fearing, doubtless, that they would oppose the course she had resolved upon. Mrs. Hurst, who was sincerely attached to her, would be as much grieved as astonished; but still she might be able to furnish some clue to the heiress's refuge and wherever it might be he determined to follow her, and insisting on an interview, use no means untried to induce her to return to Carlsforde. If he failed, Mr. Whitely must then step forward and explain to her that, being still under age, her generous scheme to enrich another at her own expense was impracticable.

Perhaps she had not departed from the Park quite alone, as he had been imagining. Hillian Gray was her chosen friend and companion, and the headache alleged as an excuse for remaining in seclusion all day might have been an excuse invented to give her time to carry out the necessary arrangements for this secret flight. It had been no freak of imagination when Noel thought that he detected the rolling of carriage wheels: in a vehicle hired for the purpose Miss Carisforde must have departed; neither could it have been mere fancy that a shadowy figure appeared to him in the library. It must have been on her way to the vehicle in waiting that she entered the room, to bid him a mute farewell. How very much he now regretted that he had not succeeded in preventing her escape. Half a dozen words frankly interchanged might have taught her that he was no party to Mrs. Estcourt's efforts to awaken her compassion for a disinherited peer, and induce her to believe it was her duty to remain where she was.

Musing over these things, he put the letters into one of his pockets, and prepared to return to the house with the astounding tidings that its owner must have quietly slipped away soon after the storm commenced. But he had scarcely reached the landing when the pitiful voice of the dog fell upon his ear once more.

Reproaching himself for having so completely forgotten the poor animal, he now prepared to search for it, and presently was guided by the sound to a narrow passage leading to the turret, in which the steps to that upper floor—now entirely gone—had been situated. The turret had also disappeared, and only a yawning chasm remained to show where it had once been. Was it down this the creature had fallen?

Moving with the caution that was so necessary, he drew as near the brink of the chasm as he dared, and looked over. A few feet below there was a narrow ledge of masonry, and he held the lantern down so that its light might fall upon this, the only projection betwixt his own frail support and the heap of stones on the sward far beneath.

One long, searching gaze, and then a cry of horror burst from his lips, for the first object that met his view was the white and agonized face of Hillian Gray! Intense surprise claimed all Mrs. Estcourt's faculties for some moments. Hillian Gray here!—Hillian, whom—when he had thought of her at all—he had supposed to be safe in her own chamber, or else far away with Miss Carisforde! Great heavens! How came she in such a frightfully dangerous position?

With this question he roused himself to the necessity of rescuing her from it, and all his natural self-control returned to his aid. Flashing the lantern again across her ghastly countenance, he saw that she was unconscious of his presence—that her upturned eyes were glazed with terror, and saw him not; and he feared to speak lest he should startle her into slackening the convulsive grasp of the little hands, which he now observed to be clinging to the woodwork, at which she appeared to have grasped while falling from above.

One incautious movement on her part, and her destruction was inevitable for the ledge on which

THE OFFERING TO THE NILE.

she stood was so narrow, that it scarcely afforded foothold for the unconscious girl and the dog that crouched beside her, moaning with the pain of a broken leg. It was a desperate position, both for Hillian Gray and her would-be-deliverer, and for a few seconds he felt tempted to hurry away and endeavor to procure assistance; but the thought that during his absence her frenzied clutch might relax, nerved him to attempt her rescue unaided.

Fortunately, he still possessed the cord with which the butler had thoughtfully supplied him, and in this he made a slip knot, which he contrived to throw over the girl's head and shoulders. Then, and not till then, he spoke to her, and roused her from the stupefaction of horror into which her frightful danger had thrown her.

"Hillian!—Miss Gray! Look up! take courage! Be brave, and I can help you; but don't let go—don't stir till I bid you!"

The glazed eyes began to stare at his eager face, first vacantly, then with a light in them of returning reason.

"You know me?" he asked, eagerly.

"Yes," was the faint reply. "It is—it is Lord Carlsforde. Oh! save me!"

A rude gust of wind compelled him to draw back and take up a less hazardous post himself till it had whirled by; the dog, with a pitiful cry, slid over the ledge, and disappeared, but Noel retained his hold of the cord, and Hillian was comparatively safe. As soon as he could make himself heard, he addressed her again, and had the satisfaction of learning from her reply that hope was steadying not only her voice but her nerves, and she was able to attend to the directions he gave her.

Fortunately, she was both light and active; but for these aids to his efforts he could not have raised her by his own unassisted strength. As it was, he wound the cord firmly around his body, and then succeeded in getting hold first of one of the young girl's hands and then the other, thus gradually drawing her upwards, till she found herself breathless but unhurt on the small yet comparatively protected space on which he had taken his own stand.

Hillian Gray sank on her knees, and remained in that attitude so long, that Noel at last gently raised her. The storm seemed to be increasing again, as if gathering all its forces together for one last furious attack on the dismantled tower, which was in no condition to withstand it. Every moment they lingered where they were was but exposing themselves to be buried in its ruins, and Noel urged his companion to rouse herself and let him assist her to attempt the descent of the broken staircase.

But she was faint with exhaustion, and her limbs trembled so violently that they refused to sustain her. She murmured a feeble entreaty that Lord Carlsforde would think only of himself and leave her; yet she clung pitifully to his supporting arm, and it was evident she dreaded his obeying her injunction.

To pilot her down so perilous a descent while she was in this prostrate state would be madness, and so he half led, half carried her to Miss Carlsforde's chamber, where he thought he might be able to find a restorative in the shape of eau de Cologne or ammonia.

Hillian's eyes wandered round the room with such a bewildered look in them, that he thought it would be only kind to gently break to her the fact of Miss Carlsforde's departure.

"Do not be alarmed about your friend. She must have quitted the tower some hours since, for I am sorry to tell you that she has, in her mistaken generosity, left Carlsforde secretly. But pray do not give way to any uneasiness on her account. I will go and see Mr. Whitely before I return to London, and steps will be taken directly to discover where she has gone, and convince her that it is her duty to return."

"I do not understand," said Hillian, confusedly. "If Miss Carlsforde leaves the Park—"

"She has left it in consequence, I fear, of some thoughtless remark made by Mrs. Estcourt. These speeches appear to have preyed on the feelings of my young kinswoman, and led her to imagine that she ought to renounce her rights in my favor. When Mr. Whitely or her guardians have seen and made her understand that she is not at liberty to do this, she will be restored to you; so pray do not be unhappy; her absence is only a temporary one, and I shall ask you to make her understand that, although I cannot avail myself of her kindness, I shall always cherish a grateful recollection of it."

Hillian made no reply. Indeed, she had dropped into a chair so pale, so nerveless, that she seemed scarcely able to attend to what he was saying, and Noel reproached himself for having suffered his thoughts to dwell upon his own concerns at a time when her condition ought to be his only consideration.

In one of the essence bottles on the toilet-table he found a few drops of sal volatile, which he persuaded her to swallow, and soon had the satisfaction of seeing a tinge of color return to her lips.

Every moment that they tarried here was now so fraught with peril, that directly Hillian Gray was able to stand, Noel urged their immediate flight from the crazy building. He dared not hint to her how difficult it would be to leave it lest her terrors should revive, and render her incapable of the effort; but, speaking as cheerfully as he could, he guided her to the stair-case.

When, however, her first dismayed glance revealed its ruinous condition, she would have recoiled, if Noel's outstretched arm had not prevented it.

"Courage, Miss Gray," he exclaimed. "I would not ask you to run these risks if I did not know that we may incur greater ones by lingering here. If you will but trust to me as implicitly as you did a few minutes ago, I think I can promise to guide you safely."

"But at what danger to yourself!" she murmured. "Encumbered with a helpless girl, how can you take proper precautions? Ah! if anything befalls you, how shall I ever forgive myself?"

But Noel would not hear this. He pointed out to her how unlikely it was that the tower would stand much longer. The last gust of the blast had brought down another mass of the masonry, and loitering was a folly. At the same time, he told her in emphatic tones that he was firmly resolved not to stir without her. It depended on herself, therefore, whether they endeavored to make their way at once from their terribly insecure quarters, or waited at all hazards till the morning.

Convinced by his arguments, Hillian immediately slipped her cold hand into his. Her heart sank within her, and in her present state of fatigue she felt that it would be easier to passively meet the death that menaced her than make fresh exertions; but another life was at stake besides her own, and by an heroic effort she assumed composure, and pronounced herself ready to follow wherever he chose to lead.

How they compassed the descent of that broken staircase, Noel could hardly tell. It is true that the light feet of his companion carried her safely wherever there was a resting-place strong enough for his own; but there were gaps over which he had to lower her, and then swing himself, which looked so terrible in the darkness, that he dared not meet the piteous questioning in her looks, lest they should unman him. By slow degrees, and not without receiving many contusions from falling stones, they descended until, to his inexpressible relief, he was able to swing her across a fissure into the circular chamber by which he first entered the tower.

Here Hillian would have made a brief pause, but still Lord Carlsforde hurried her on, and having ascertained that the ladder was still there, he assisted her to climb to the casement at which it was placed. But ere she stepped through it, some impulse or presentiment of impending evil, he knew not which, induced him to draw his trembling charge into his arms.

"In case we never meet again, I will say my farewell now. God bless and make you happy always, little Hillian!"

The next instant he had lifted her through the window, and was steadying the ladder and encouraging her to descend it.

"But you will come, too," she pleaded.

"As soon as you are safe, I will follow. For Heaven's sake don't delay!"

Thus adjured, she obeyed him, sinking, almost fainting, into the arms extended to receive her as soon as she reached the ground. But she refused to let Mrs. Hurst—who had pressed forward to embrace her darling—lead her away till his lordship had joined them, and she strained her eyes to watch him as he came rapidly down the ladder.

He had scarcely taken half a dozen steps when the wind came tearing round the building, and Noel was lost to view in the clouds of dust that it brought with it.

Involuntarily the young girl he had just rescued shrank closer to her aunt, who uttered a terrified ejaculation. It was echoed by a shout from the servants, and sounds that struck fresh terror to the excited Hillian. A block of stone dislodged by the gale had struck the ladder to which Noel was clinging, breaking it in half just below where he stood, and when the dust cleared away, there was nothing to be seen but a confused heap of humanity lying motionless amidst the *debris* with which the base of the tower was surrounded.

(To be continued.)

MAGAZINES.

SUNDAY AFTERNOON for May, has the following table of contents: The Room's Width, by Elizabeth Stuart Phelps; The Kingdom of Heaven, by John Bascom; Six Stories in One, by Helen Campbell; Calvin the Sinner, VIII, IX., by Josephine R. Baker; The King's Advent, by Mary Bradley; The Humility of Positivism, by Rollo Ogden; The Mormons, II., by Thomas L. Rogers; Women's Experiments in Economy, by Julia McNair Wright; Making Out, by M. E. Bennett; The Present Standing of Political Economy, by Francis A. Walker; An Excellent Mathematician, Philosopher and Divine, by Susan D. Nickerson; Meg, by Julia C. R. Dorr; A Blessing in Disguise, by J. T. Tucker; A Curious Phenomenon of the Plains, by Alfred Terry Bacon; The Year, by Annie E. Cole; A Night on the "Bitter Lake," by David Ker; A "Neighborly Interest," by Helen E. Smith; The Still Hour, Editor's Table.—Christianizing the Churches; Some Abuses of Journalism; Strategy in Debate; the Current Crazes; Literature.

GIVE US LESS NOISOME NEWS, MESSRS. EDITORS.—Lately we have had a disgusting trial in Washington; the private relations of a base old man and a vile woman have been exposed to public view by one of the most indecent of criminal lawyers, and the newspapers, all over the country, have been printing this delectable stuff for the instruction of their readers. What interest is subserved by defiling white paper with nastiness like this? There is absolutely no justification for it; it is an offense against common decency; it is a disgrace to journalism that it trades in wares of this description and makes money by hawking filth and corruption.

Not only do our newspapers offend by the publication of the vile details of great crimes, but also by picking up and spreading abroad little scandals, little unpleasantnesses in society, little bits of gossip that no sensible or honorable person wishes to know or would suffer himself to repeat. Much of the space of many weekly papers and of not a few dailies is devoted to matters of this description. The tittle-tattle of the neighborhood that is not only silly but poisonous in the extreme is gathered and served up in as appetizing a manner as possible for the entertainment of the whole community. If a woman behaves indiscreetly, the fact, more or less embellished and sufficiently disguised to whet the appetites of the gossips, is likely to appear in print the next day.

If a man commits an error of which he is pretty sure to be ashamed, and concerning which he would be glad of the indulgent silence of his neighbors, there is no mercy for him; he will have a chance to read the record, a good deal magnified, in the local columns. Domestic infelicities with which the public has no business at all afford material for spicy items; business complications are worse complicated by unauthorized reports concerning them; little troubles in the churches which those who have the care of their interests are doing their best to compose are fanned into grave dissensions by references to them in the newspapers. Sometimes, when the details of these small scandals are not given, there are little hints and innendoes that serve to put all the prurient and meddlesome noses in the community on the scent for indecency or mischief. "The skeleton in a certain house in Ward Blank is likely to get an airing pretty soon." "There is a prospect of a row about the music in one of our churches,"—and so on. What excuse or justification can there be for the publication of such items as these? Who is profited by reading them? What interest of intelligence, of morality, of decency is promoted by spreading abroad these miserable details of gossip? The only reason for printing them is that many people like to read them; they make a sale for the papers. But the taste that craves them is a vicious and degraded taste, and the business of gratifying and stimulating such a taste is a bad business.

What is thought of the woman who goes from house to house in her neighborhood rehearsing bits of intelligence like these? What is said of the man who devotes his leisure to the circulation of the current rumors? If it is disreputable for a man to go about ringing his neighbors' door-bells and reciting to them such scandals by word of mouth it is more disreputable for him to print them in a widely-circulated newspaper. The story that a gentleman would not stoop to tell in good society, no gentleman ought to print in his paper. Meddling and mischief-making is just as reprehensible in a reporter as in any other man. The fact that such stuff makes his paper sell is a poor justification. And until the managers of newspapers learn to discriminate with a little more care between the news which the public has a right to hear and the news which is simply noisome or injurious scandal, the business of journalism will suffer a serious loss of respect and influence.—*Sunday Afternoon for May.*

For Women.

CONDUCTED BY MISS FAITH RIPLEY.

A "POSTCRIPT" TO SOME SPRING NOTES.

BY THE EDITOR.

Millinery.

IT would be hard to name the leading style or styles in the way of bonnets and hats. Broad-leaf narrow brim, no brim, flare, cottage, high crown, and low ditto, all are to be seen in endless variety. Even the poke bonnet of other days, or, as it is now called the Madame Jarley, is in the market. No two hats are precisely alike. The shapes may originally have been identical, but the trimming or a deft bending of the shape a little on this side or that has completely transformed its appearance. Every lady can suit her bonnet to the requirements of her face and the result is some very pretty and piquant styles of millinery. If only women with withered faces or high cheek bones, could be induced to wear large bonnets of dark colors, instead of making guys of themselves in dainty, little chip hats with white marabout tips and satin ribbon as trimming, the beholder would be spared many painful sights. So great is the latitude allowed this season to individual taste, that every woman can have a becoming hat, if she will only exercise some taste in the matter. Leghorn, Tuscan, chip and fancy open-work braids are most fashionable. The blended straws also come in for a goodly share of favor. Blue and gray, black and white, cardinal and straw color, black and straw are a few of the combinations in mixed straws. Ostrich tips and feathers are largely worn, as are also flowers, of every hue, and no hat is complete without the addition of a handsome ornament in crystal, crystal and gilt, crystal and silver, or gilt and steel. For shirring and pipings satin is usually employed, while the scarf may be of fancy ribbon-velvet, Breton lace, or some one of the lovely gauze or grenadine fabrics.

A large flare bonnet bent so as to fit closely to the neck was faced with black satin trimmed profusely with jet; the outside had a scarf of silk, a long black ostrich feather, and a cluster of deep flesh roses. A Leghorn with a wide brim was trimmed on the outside entirely with maize, satin ribbon, feathers and large roses, being all of this color. The front was faced with wine-color velvet. A brown and gray mixed straw hat, narrow brim, rolled up on one side, was ornamented with pipings of brown silk, two brown ostrich feathers and a small crystal star. An elegant and unique bonnet to be worn with an olive silk and *damasse* suit, was a cottage shape covered with olive silk; around the crown was a wreath of Brazilian beetles, without a blade or leaf of foliage; an ostrich tip of olive, finished the decorations. A Leghorn, Madame Jarley (or old style poke) bonnet, was a marvelous sight. With its aggressive peaked front, its long maize color ostrich feathers, large bows and cascade of tea roses, it transported one to the Sunday school concert hall, where the "original" Madame Jarley is wont to display her wares. A fine black straw hat, high crown and narrow brim, rolled a little on the left side, was trimmed with jet and pipings of satin, and a long black ostrich feather. At the left side a cluster of half a dozen half-blown bright red silk buds had a very pretty effect. A broad brim hat was edged with fancy crystal braid and had pipings of black satin, crimson roses and feathers for trimming. A novel effect was produced on a maize-color straw by a spray of grasses and exquisitely pretty hazelnuts. For street wear, the "Pinafore," a broad brim, moderately high crown, rolled on one side, promises to take the lead.

Woolens, Cambrics, Organdies and Hosiery.

The fashionable colors in woolen, and woolen and silk goods are *ecru*, peacock blue, sapphire, gray, brown, navy blue and dark garnet. This has reference solely to the *leading* shade, for all of the novelties come in *bourrette* effects. *Momie* cloths have a crape-like surface, and come in either solid colors, or in stripes with brocaded patterns. Chuddah cloth is to be had in all the newest shades. Plain French bunting, 48 inches wide, at $1, is soft and fine, and very much superior to both English and domestic manufacture. It comes in the most delicate as well as the darker shades, and promises to be extensively used in combination with silk. A line of goods—a mixture of silk and wool—has alternate stripes of silk and variegated wool. One design had a pale blue silk stripe, through the middle of which ran a fine cord of blue with a raised design in blue and brown wool, at intervals of about two inches. The alternate strip was of mixed white, blue, cardinal and maize in wool. This style comes also in many other designs, the most *distingue* of which are those in white silk, and gray and black wool. They are 48 inches wide and cost $2 per yard. Soft gray and wood color cloths with brocaded silk stripes in mixed colors, cardinal usually being the leading shade, cost $1.62; width, 24 inches. Pin checks are much worn. In blue with checks of white silk, they make charming costumes for little folks. The tendency to raised designs, which give the goods the appearance of being "tufted" at irregular intervals with bits of bright worsted, is very marked. A mixed white silk grenadine and wool of shaded pale and dark-gray, is simply exquisite. It is composed of alternating stripes; the shaded gray stripe giving the fabric a unique effect. In less pronounced goods there is a great variety, stripes and checks are the principal designs, and gray, wood, *ecru*, are the prevailing colors. Cashmeres are to be had in all the novel as well as the old colors, and the moderate price at which they are offered, combined with their serviceableness, make them a most excellent investment. Many will be glad to meet an old-time favorite in the all-wool *mousselines*, they being, in fact, nothing else than all-wool delaines. They are manufactured in sapphire violet, blue, lavender and in darker colors. An all-wool *mousseline* Princess wrapper in pale blue, made with Watteau plait, and ornamented with satin bows and pretty lace, is a most dainty morning costume for cool days.

Cambrics come in chintz colors and designs with borders and without. English cambric, a more closely and heavier article, is also shown; prices range from 25 to 30 cents. Some lovely Scotch ginghams are shown; large plaids and gay, small figures, on well-covered ground, being leading varieties. Lattice Stripe, something new both in design and material, is so delightfully pretty, that to see it, is to be ensnared into buying it. Imagine something between a cambric and a muslin, white ground, with open-work stripe about an inch wide, the spaces between the lattice stripe being covered with a fine, black vine, and small, purple flowers. They come in some half-a-dozen different designs, and cost from 12½ to 20 cents a yard. English jaconet, a fabric heavier than muslin and a little lighter than cambric, is shown in numberless pretty Chinese patterns. Cost 20 cents per yard.

Linen lawns present the same features that have distinguished them in past seasons, having escaped the bourette effect mania. They come in one or at most two delicate shades and a fine vine or leaf or spray is the design usually shown. They range in price from 10 to 20 cents a yard; the price being determined by the fineness of the material. Organdies are quite as beautiful as ever, but no very new or striking effects are shown in them. Price, 25 to 40 cents.

Momie cloth, satinet and cotilline are the latest novelties in washable materials. The *momie* cloth presents a crinkled surface closely resembling crape. Satinet has a glossy, satin-like surface, which is guaranteed to successfully withstand laundrying. Cotilline is traversed by fine reps of coarser texture, and is covered with fine leaves and flowers. In these goods—*momie*, satinet and cotilline—the figures are small, the ground well covered, and either plaided, striped or mottled. They are nearly a yard wide and cost from 35 to 45 cents per yard.

The display of hosiery is something calculated to delight the soul of the artist in color. More and more is it becoming the custom for ladies to clothe their feet elegantly, and the effect of this tendency has been to stimulate the manufacture of beautiful designs in stockings. The Idlewild Stripe is in lisle thread and composed of alternate stripes of white, black and red. Cost $1 75 per pair. Plain grounds with polka-dots in silk come in all colors at $2 per pair. Madras Cluster is thin and elastic and the rib stripe gives it a showy and pretty effect; price, $1 to $2 per pair. Perforated hosiery in pink and blue, for evening wear, cost $1. They are so sheer that the skin can be plainly distinguished through the open-work. Black spun silks are offered for $1. Unbleached, beautifully embroidered in silk floss, designed to be worn with low shoes, come at $1 50. Mourning stockings in great variety; blacks, purples and grays are sold at from $1 to $3 per pair. Cotton hosiery, in all colors and patterns, cost from 50c. to $1 25 per pair. Balbriggans, excellent quality with clocks, 25 to 50 cents. In children's stockings there is a very great variety. All possible combinations of color are used, but in design they are usually "mottled" and striped with embroidered fronts. In price they range from 25c. to $1 25. Ordinary white and unbleached stockings can be purchased if desired, but very few in these days invest in such unpretentious hosiery.

Silks, Damasses, Foulards.

To own at least one black silk, is the ambition of every woman, and as many of us as can accomplish it, are sure to possess one for church, and a second rather longer and finished with more elaborateness for semi-dress occasions. Every wife should insist on a black silk as a *right*, and neither sullenness, ridicule nor a point-blank refusal on part of the chancellor of the family exchequer, should make her waver in her fixed determination to own a gown of this most desirable material. The prices at which it is offered are too tempting to be resisted. Think of it, those of you who have

had to pay $2 50, $3 and $4 for only a fairly good quality of silk, $1 25 will buy a rich looking, closely woven silk, 21 inches wide, with a pretty lustre. For $1 50 a richly corded silk, 23 inches wide, is procurable, and an investment of $1 75 secures for one an elegant quality of silk. The more expensive grades, $2, $3, $4 and $5, are superior to anything ever before offered. That at $5 equalling in weight and finish what has heretofore cost $7 and $8. A word of caution. The competition is so sharp and the facilities for weighting silks with poisonous dyes are so perfect, that many unscrupulous manufacturers do not hesitate to avail themselves of any and all means to produce *cheap* silks, leaving out every other consideration, and the result is, there are many lines of these goods in the market which are not worth making up. It is well to be familiar with the names of some of the reputable manufacturers. Goods from the looms of any of the following makers can be relied on to give complete satisfaction: *Bonnet, Ponson, Tapissier, Guinnet, Giraud & Co.*

Three lines of silks that seem to me to be especially adapted to those who want rich looking and durable dresses, are the Pride of France, manufactured by *Guinnet*, the American Cashmere Indestructible, and *Giraud & Co.'s L. & T.* Family Silk. The prices range from $1 50 to $5 per yard, being graded according to quality and finish. No mere description of a fabric, however realistic and elaborate, can convey a correct impression of it; to say of a silk that it is rich, or elegant, or heavy, gives one at best but an indefinite idea of it, and those who contemplate purchasing should not omit to supply themselves with samples of standard grades.

In plain colored silks the leading tints are named after the precious stones, Sapphire, garnet, pearl, emerald, amethyst, mosaic, turquoise, and cameo. The idea is a pretty one and the high finish of the silks with their lustre, and sheen reminding one of the lights and shades of the jewels makes the simile not unapt. Peacock blue, peacock green, and some eight shades of cameo—ranging from the most delicate wheat color to almost a brown—are the most pronounced novelties. The prices range from $1.25 to $3.00. For combination with plain silks there come great variety of fancy *damasses*, Pekin stripes, satins &c. Striped fabrics are extensively worn to give tone and style to plain goods. Vestings, cuffs, *tabliers* and broad folds of these showy materials appear on all fashionable costumes. Some of the combinations in satin are navy blue and gold, wine and gold, green and gold, gray and gold, black and gold, brown and gold and black and white. There are satin and watered stripes, satin and *moire* and satin and raised stripes. These come in navy blue and cream, cream and wine, *paon* and green *paon* and blue and in all other possible combinations. The satin and Ratdzmire stripe is a most beautiful fabric. No more elegant costume could be devised than one of cameo silk and satin and Ratdzmire stripe either the same color, or of garnet or some other contrasting shade.

The *damasses* and corduroy stripe, at from $1.75, the raised and narrow satin and gros-grain Pekin stripe, at from $1.75 to $3.50 are also very elegant goods.

In *damasses*, combination of old gold and garnet, gray and blue, gold and olive, and peacock blue on a plum ground are shown. Both in variety of design and of combination, the *damasses* offered this season are superior to any goods ever before put on the market. The samples of black shown me were marvellously beautiful. The designs were as artistic and exquisite as any intended to be developed in water colors or oil.

The highly finished satin surface displays to excellent advantage the raised designs, the effect in some lights being that of embroidered patterns on velvet foundation; in others, velvet embossing on satin. Instead of the small, closely figured designs heretofore so much in vogue, in these newer *damasses* long, graceful ferns, and exquisite, rare, hot-house favorites, are used. Flower, leaf, stem, vine, whatever is attempted is portrayed with amazing fidelity.

Foulard, that favorite of other days, has again come to the front. It will be used mainly for the seaside, house-dresses, and for vestings. Very few street costumes are made of foulard throughout. They come in navy blue, garnet, plum, dark-green, satin face with polka dots, at $1.50 per yard. The foulard stripes for trimming, (a novelty) are in blue and white, cream and gold, blue and gold, and in other combinations; price $1.50 per yard. In summer silks, are the *Jaspe*, ehlutz, *chene* and *Jaspe*, and quadrille effects. There is a great assortment of fabrics of this class, and those who recall the dreary, characterless summer silk of other seasons, cannot but be thankful for what the artist and manufacturer have done in the way of improving these goods. The most diverse and seemingly utterly irreconcible colors are so blended and shaded, and so skillfully introduced, that the beholder is conscious only of most delightful effects. Lying before me is a sample of what I consider the most charming summer silk I ever saw. The colors are plum, sapphire, white, cardinal, and gold; the pattern is quadrille,—but what idea of the beauty of the fabric is communicated by such a bald statement?

This display of novel and beautiful products is pleasing not only as a spectacle, but it is also gratifying as an evidence of improved taste on the part of purchasers. Now, that Fashion has called in the aid of Art, there is no need to fear a repetition of the glaring inconsistencies in color which have offended the eye of taste in past seasons. Every year witnesses an advance in good taste and refinement in dress, and it is not too much to hope that in a little while the purchaser will fitly supplement the work of designer and manufacturer, by evincing as keen a perception of the truly artistic in modelling and embellishing the dress, as is shown in the preparation of the material.

For a view of the very many useful and beautiful fabrics and articles mentioned in this review, I am indebted to Messrs. Lord & Taylor, of Broadway and Twentieth St., New Yotk,

EDITORAL ANNOUNCEMENT.

THE "Correspondents Corner." is crowded out this week.

In response to three or four requests for a model of a garment suitable for an elderly lady I will publish in our next issue cuts of three dresses, two of which can be adapted to ladies of almost any age and the third is essentially an old ladies' gown. I give the three because it is'nt quite clear to me how old an "elderly lady" is. A young lady has petioned me to show her a stylish model for a costume to be worn at a full-dress wedding reception and her reasonable request will be gratified next week.

If the lady who wrote asking for cuts of patterns suitable for washable materials, will send me her name and address, I will forward some illustrations. I cannot offer to furnish them in RURAL, as we have had so much fashionable intelligence lately. If the correspondent can wait until about the 1st of June, I can promise the illustrations about that date.

THE OFFERING TO THE NILE.

OUR engraving on page 285, illustrates the sacrificial rite practiced annually to propitiate the God of the Nile. In earlier ages a young and attractive girl was selected garlanded with flowers, and at a given signal consigned to the cruel waters, but latterly an effigy is made to do service instead of a girl. Whether or not His Spiritual Excellency of the Nile is cognizant of the deception practised on him, is not recorded. The inundations however continue much the same as when humans were the victims.

THE WOMAN'S CLUB.

THE TRUE SERVING OF GOD DOES NOT CONSIST IN BUILDING COSTLY CHURCHES.

HELIOTROPE calls on me to bear in mind the "Widow's Mite" and the jewels the daughters of Jerusalem contributed to the building of Solomon's Temple. I do not find it recorded that the "treasury" into which the first named cast her all was disbursing funds for the erection of a synagogue, and before my statement about Christ's having set us an example in being content with "upper rooms" can be disproved, Heliotrope must be prepared to state postively that money was being collected for some such purpose. If she cannot, the reference to the Widow's Mite proves nothing at all in this controversy. If the ladies of Jerusalem chose to give their jewels, for the beautification of the Temple, they were giving what was necessary neither to their happiness nor their well-being and no one could object to their so doing. My argument in the communication to which Heliotrope took exception, was directed against encouraging and commanding people to deprive themselves of necessities to help defray the cost of expensive churches. The system of religion which enjoins the "ornament of a meek and quiet spirit" as preferable to costly apparel can hardly be made to countenance the building of churches out of the sufferings and privations of the poor and (as not infrequently happens) by fraudulent representations. If a woman should spend all her substance on "Sunday clothes," and claim that she was serving and honoring God by appearing in His house handsomely attired, would we be at all blinded by her statement? Would we not know that vanity or a love of beautiful clothes and not a desire to honor God was the main spring of her course of action? And to apply the same test to churches are we serving God or simply gratifying our own pride or delight in sumptuous surroundings when we call to our aid all that art can devise and money command to embellish the sanctuary?

I'm at a loss in what spirit to take Heliotrope's statement that "the good Father will not let her (the sewing girl) want because she denied herself to help along His cause." That she means it seriously is evident, but that any one who has had the least experience in the life that surges around us, can make a statement so utterly opposed to fact is certainly amazing. If there is one lesson which is being constantly impressed on our attention, it is, that there are no providences in matters of worldly advancement. It is not the godly man, the one who gives his all to the Master, but the man of talent, enterprise and industry who secures wealth and achieves distinction. He may also be a holy man, but that element contributes not at all to his success. The woman who inherits, marries or makes a competency is "provided for" whether she is religious or not, while her poor sister who through lack of energy or opportunity has never succeeded in saving money, ends her life as a public burden though she has served God from her youth.

Our hospitals and poor houses are filled with those who have lived near to God, and who have sacrificed much for the Master. Not infrequently godly people have absolutely starved to death. How would Heliotrope like to be thus "provided for?" There is no truer saying than that "The Lord helps those who help themselves." If one is willing to sacrifice health, strength and money for the cause of Christ, his reward will consist in the consciousness of well-doing, and not in the possession of comforts or money acquired through Divine interposition. The Lord will most certainly not work miracles in finance for the benefit of good people. "What ye sow that also shall ye reap." The seeds which produce material comforts and worldly prosperity are, as I said before, talent, industry and energy; they may be accompanied by the highest spiritual excellence, but quite as often they are not.

Personally, I admire beautiful church edifices, and think them in keeping with our advance in civilization and refinement. The exquisite appointments and charming artistic effects, minister to our love of the beautiful and cannot fail to refine us; but I do object most strenuously to its being insisted on that it is a matter of *duty* to adorn the church, and that we are *serving Christ* by subscribing money toward buying a carpet for the altar steps. Ladies will neglect their family duties for weeks, and work themselves sick preparing for a fair, the proceeds of which are to be devoted to paying for a new organ, all the while deluding themselves with the idea that they are working in the service of the Lord.

Probably Archbishop Purcell was possessed by the same idea, when he furthered (?) the cause of Christ by building churches and theological schools out of the funds entrusted to him, thereby reducing thousands of worthy people to pinching want.

Be honest in the matter. We want a fine church, not because we can worship better in it, nor because we have reason to believe we are doing God's will by building it, but it will gratify our pride or our taste for elegance and beauty to worship in a handsome edifice. JACQUELINA.

TEMPERANCE; CHURCH BUILDING; CHURCH ATTENDANCE. ROUGE FOR THE LADIES.

"A GLASS of sherry wine added just before serving is a great improvement," "is part of a recipe clipped from a leading paper. It may be an improvement, but I venture to affirm, it is a dangerous one. I am glad the RURAL does not publish such recipes, and I wonder how mother's can prepare food from them and serve it to their sons, with no fear of the consequences. How can they make wine and beer, and giving it to their sons and daughters and claim that "it is perfectly harmless" contending, perhaps, the while for Prohibition? Our young men and (I may safely add) young women are not safe; though, every saloon should be closed, throughout the length and breadth of our land, until wine and liquors are swept from every table and side-board. It is woman's work to do this, and when we have accomplished it, "the axe" will strike the root of the evil, "and we may cry Prohibition," with bright hopes of success.

I wish somebody could give us the history of the "church edifice" that the sewing girl contributed "quite liberally" for. All churches are not "artistically frescoed," nor do they all have "costly altar-pieces." I remember the self-denying efforts, made a few years ago, in a Western town, to build a plain church structure; and more than one "Widow's Mite" was cast into the "treasury" before the work was completed, with nothing indispensable. A young lady was censured for contributing more than her friends thought expedient, but she is far above want to-day, and I would say to those who hesitate to give, through pecuniary fears, "Wherefore, if God so clothe the grass of the field which to-day is, and to morrow is cast into the oven, shall He not much more clothe you, O ye of little faith?" I think with Sarah—many are "hindered from attending" church, yet I think the fine churches and rich dresses would hardly keep them away if they were made to feel, they were welcomed. Have we no responsibility in the matter? I once heard the remark, "I never go to that church, they're too stuck-up to suit me." I remembered I had heard similar remarks from others in reference to the same church. Soon after a new church was organized, when a good number entered the poorer fold, that might have been gathered into the richer one. A kindly word, a pleasant smile, would cost us nothing, yet would be of value to our poorer sisters, and they would forget their plain dresses and be made to feel at home though their surroundings were beautiful and costly. Now, my dear Washtenaw, as far as I have had experience, "happy families" are much more desirable than "fighting" ones; consequently I think as Dr. Watts does, about "children of one family," yet I think you are decidedly wrong when you say "women are justified in using powder or rouge." I cannot see how it will "add to their attractiveness." Lady Maude said she had done nothing but her duty (in "Weaker than a Woman") when asked what she had "done to win such a royal dowry of blessing from young and old, rich and poor?" "It is the little deed of love, the little act of kindness" unselfishly bestowed, that makes up a beautiful life, and the lady is most attractive who has the greatest charms of mind and heart.

I am encroaching, yet if criticising the gentlemen, is in order, I would like to express my high appreciation of Professor W. J. Beal's letters on "Country School-houses." Education, &c. I have been much interested in them, as every country woman, (and man, too,) should be—they certainly ought to be heeded, and I hope will do much good. BITTER SWEET.

A TALK ABOUT DISH-WASHING.

THERE seems to be a low murmur of dissatisfaction, like the rumbling of distant thunder, heard from the numerous wives and daughters of farmers, because there are so many dishes to wash, and only one way to perform the, to them, disagreeable task. In large establishments like penitentiaries, and reform schools, the dishes are washed by steam, but such an appartus cannot be kept in every house. Occasionally we read of a machine being invented which does the work well, but for some unknown reason, it does not exhibit itself in hardware stores, and agents fail to bring it to our doors. So we conclude the invention is a failure. We might apply to Edison, his genius would doubtless soon supply the kitchen with the desirable article, but most likely it would be like some of the patent churns in that it would require as much time and labor to cleanse the machinery, as to wash the dishes in the old way.

But why need we complain so bitterly of washing dishes three times a day? How much better off would each housewife be, provided the dish-washing could be dispensed with. In nine cases out of ten, there would be no higher culture, no greater advancement in morality no more physical strength acquired. Instead, there would be a great deal more gossip retailed, and scandal would be rife throughout the length and breadth of our land, to such an extent, that true friendship would be unknown. Families would be still more frequently broken up by harsh words, and petty quarrels caused by jealousies; and the courts of justice would find longer lists of divorce cases to be tried.

As it is the custom of all civilized people to use dishes, at meal times, it behooves us as housekeepers to be thankful if we have an abundance of pretty china-ware. To complain because we must with our own hands, make it clean after using, seems a sin. Mothers often teach their little daughters to do fancy work, such as embroidery, drawing or music, that they may please papa and their friends, with some of their artistic work. The child is eager to learn because she likes to do what she sees her mother do, with seeming pleasure. Now if she never heard mamma complain of those dreadful dishes and was allowed to work with her at the kitchen table, and taught to do the work in the neatest and best manner because *this* work was just as much of an *accomplishment*, and added even more to the comfort and happiness of the family, than a pair of handsome slippers, a beautiful drawing, or a brilliant rug with impossible cats and dogs, that have occupied months of time, there would be less complaining, by the future housekeeper, at least.

Occasionally one repines because she has no time for intellectual pursuits. Just to think of all the best part of one's life being spent in washing dishes for a half a dozen persons—more or less. "It is too great a sacrifice;" says one. It is a great pity that those who have a gift for higher work, provided there is any—"higher work"—could not find it out before they take upon themselves wifely duties and family cares. But let us see about this sacrifice of time, for whom do we wash the dishes? For husbands, fathers, mothers, brothers and sisters, and they in return are working for us. In most cases doing all in their power, to make our lives comparatively happy. Would we consider it a sacrifice of time and talents to wait upon any one of them during a long and severe illness, even until our physical strength was completely exhausted? or would we consider it a sacrifice if we were required to give up life itself to save the family from destruction. Now when we wash dishes, we are adding to the comfort of our loved ones just as much as though we were nursing them through a long and tedious illness. And we have besides their society, and know that they are able to converse, with us, advise us when we need counsel, and cheer us when we are inclined to despondency.

Washing dishes is undoubtedly woman's work, and I have no doubt Mother Eve clapped her hands for joy when she found she could occupy a part of her time in washing the dishes, which I imagine she found in quaint patterns just outside of the Garden of Eden.

Even in these days of inventions and progress, Eve's daughters must follow the old, old occupation, though it does take the time we would like to spend in intellectual culture. But if we are exceedingly anxious to cultivate our minds or to develop certain God-given talents we can dispense with something less than the prescribed number of changes in a fashionable wardrobe and with several yards less of trimming to each suit, and thus gain quite an item of time for home culture. MAY MAPLE.

LIGHT ON THE SUFFRAGE QUESTION.

A SAPIENT local editor of an adjoining town has brought the closing argument against woman suffrage, in reviewing, and with a certain cautious reserve, praising a lecture of Susan B. Anthony's on the subject of the ballot, he says, "*but* in spite of her arguments there yet remains, besides the bearing of arms, *the mending of the highways*, rather an unfeminine accomplishment, but always associated in the public mind's eye with the qualifications of an elector." Miss Anthony might better, after this, stay at home and call her mission a failure, if the majority of her audiences are to be men of such calibre.

However, in the village where this same editor resides, not one of the lawyers, doctors, merchants, bankers or editors, were ever known to injure their spines, or take the starch out of their collars, by working on the roads; and it would be as surprising a sight to see one of that class holding a scraper, or taking the stones out of the highway with a hoe, as it would be to see the milliners and dressmakers of the same place engaged in the business; although every woman owning property there is promptly called on to pay her tax for the repair of those same highways. The work is let out by contract to individuals, who hire such assistance as they need, and the work is done much more efficiently than any lily-handed clerk or dignified editor could do it if he were inclined. And when men, who on other subjects are counted candid and intelligent, are capable of using such arguments against women, there is something warped about their judgments and sense of fair play. It is what we call the "Old Adam" cropping out with stately hypocrisy, trying to make out a case where there is none. It is the same sentiment, manifested in a less straightforward way, that I heard a man express a few years ago, a man who had a wife and grown-up daughters, who said "he hoped he never should have to go to the polls with a woman or a nigger."

Fortunately for human progress people are not all alike, and there are many fair-minded men who do not feel as if they lost any masculine dignity by owning that taxation without representation is just as wrong in principle where women are the sufferers, as if they themselves were concerned. There are many, too, who freely admit that women ought to vote on the temperance question, because it so closely affects their welfare; and it looks as if the time were not far distant when men who have survived the indignity of going to the polls with the despised colored man, will have to endure the presence of a woman there also. Domestic Economy.

CONDUCTED BY EMILY MAPLE.

PEN THOUGHTS FROM EVERY-DAY HOUSE.

ANNIE L. JACK.

Fruit in Spring.

"PLEASE, more beets!" It is the cry of the little ones these days, when the stomach claims something as a blood purifier, and it is always best to keep on hand a store of sound onions, carrots, beets and celery for spring use. I think every mother has noticed, at this season of the year, how the children of her household are subject to slight billious attacks, how a small cut is hard to heal, and pimples abound. There are not, at least in this climate, the usual facilities for exercise and ventilation, hence these small disorders appear on the surface of the body. Apples in New York are cheap; it is surprising to read the markets and see that a barrel can be bought for two dollars. It is wisdom for every household to use this nutritious fruit as freely as bread, and while pleasanter to take than drugs, the constaut use of apples by children is often a preventive of doctors' bills.

Fruits, raw or cooked, contain sugar in large proportion and possess those very necessary ingredieuts in the structure of the body—phosphorus and sulphur. So, it is plain to be seen that the child who has access to the apple barrel will not need so much the "brimstone and treacle," or other blood purifier that was once deemed necessary every spring. Of all fruits the apple is most easily digested when properly masticated, and the person who for his supper partakes of bread and baked apples, will furnish more healthy nutriment to his system thau if he had chosen broiled steak. The use of all kinds of fruit is conceded as valuable in their action on the blood, in scrofulous and scorbutic habits, and it is to be hoped the day is past when a farmer's home will be considered complete without its wealth of fruit, more valuable than gold.

HINTS FOR THE HOUSEKEEPER.

MARY BEAL MC'LOUTH.

WHEN "Harvest apples" are two-thirds grown, and before the seeds ripen, cut them up and core. Cook with the skin on a few minutes, over a quick fire. We consider this a rich treat.

Fruit of any kind has a much better flavor if the sugar be added before cooking it. Small fruits are good dried, if sugar is added and the fruit scalded; then skim out the berries, boil the liquor down and pour over. Soak a half hour in cold water before cooking for the table.

You can make of an old candle mold a punch for taking out the cores of apples for baking. File it in two in the middle and sharpen the small end of the upper half.

Graham flour must be kept bug-tight, or, before you are aware, it will be full of webs and worms. A butter tub is very safe and convenient to store it in. Have a tight-fitting cover, hoops tacked on and the outside painted.

Have a tin pail made with a cover to keep your bread in. The diameter should be the same as that of your bread-tins; the same size at top as at the bottom, and sixteen inches high. It can stand on the floor in the pantry, and so save many steps down cellar. Bread and cake will keep moist, and do not mold as soon as they would in stone.

Gem irons should be greased and smoking hot when bread, biscuit or cake dough is put in.

We, as a family, prefer cracked wheat to oatmeal. Sift, and put the coarest over the fire in a large amount of cold water. Cook two hours, salt, and stir in the remainder. Do not make it as thick as meal mush. Eat warm with sugar, or if cold, a sirup made of sugar. Mush of any kind is nicest taken out in bowls, and covered with a plate to prevent the surface from getting dry.

Buttermilk is best, and sour milk the next best for freshening beef, pork or fish, and will preserve beef for several hours. I soak salt fish eighteen hours in buttermilk, with perhaps one quart of water; change every six hours; then rinse, dip in flour and fry in as little grease as possible, until well cooked through and very brown. Many cooks swim fish in grease, and do not cook long enough. Better put in a little more pork gravy or suet when half done than so much at first. In freshening, always put the skin side up so the salt can have a chance to settle to the bottom of the dish.

If you have beef, either fresh or corned, that is tainted, soak the same as fish, boil an hour or so, throw away the water and put in fresh to finish. When it comes to the table, you will be surprised that so good a dish was made out of such poor material.

Always pour water over potatoes before paring them. It's so much cleaner, and will save paring them the second time.

From now until time for new potatoes—unless your potatoes are very mealy when cooked—draw off the water, dry thoroughly, running a fork through them to let the moisture pass off, sprinkle over them a little salt, pour over some rich cream, and let come to a boil.

To prepare raisins for cake, chop in a wooden bowl, with a chopping knife.

Cotton flannel is nice for iron-holders. Cut them *round*, and save burnt corners.

Pour the water out and set the tea-kettle where it will freeze. The lime will crumble off.

Have a hole bored through one end of the molding board, so it can be hung up. Always use the same side and have the other side painted.

Paint the outside of the butter bowl; I think its a preventive against its checking.

Quicksilver mixed with white of an egg and applied with a feather to every crack and crevice in a bedstead, will kill bed-bugs. If you are moving into an old house, put some around the mop-boards and in the cracks of the room and under the edges of the paper, if there be any loose. You'll never see any more of the pests unless they come from some other place.

Burn or bury, in some deep, secluded place, those old boots and shoes, and don't have the the back yard filled with an unsightly "mess" of rubbish. Take the old tin-ware to the creek, if you can't get rid of it any other way.

Study how to economise time and labor, consider *once*, how many steps you take getting breakfast, and see if you can't do the same work with less labor to-morrow.

When leaving a room always wait, and ascertain if there is any article which you ought to take with you.

A WORD TO MOTHERS.

WE all know that the early spring weather is trying to the health, and that children particularly need watching over, to protect them against colds, sore throat, etc. Imperfectly ventilated school-rooms and unsuitable clothing, are fruitful causes of sickness among the little ones. The mother may not be able to control the former trouble, but she can the latter. Many mothers think they are doing their children justice, by sitting at the sewing machine hour after hour, making ruffllings and plaitings as numerous as useless. Sometimes they keep on stitching until they become so weary and nervous as to speak impatiently to the children they are toiling for. Would it not be better to think less of ornamentation and more of comfort? Garments ought always to be neatly made, and if convenient, trimmed to a reasonable extent. The matter of elaborate trimming is often overdone, with no better motive than a desire to excel. The writer has seen little girls that tottered under a weight of velvet and ermine, yet they actually shivered with cold. Surely, it was not the lack of clothing, but the unequal way in which it was distributed that made them uncomfortable. The furs kept the head and throat unnaturally warm. The sensitive feet and limbs which needed the most warmth, were barely protected by the thin stockings and fine kid shoes. If the little girls so dressed live to reach womanhood, the delicacy of their health is wondered at. If they die early, there is a great deal of talk about "mysterious Providence." It is important in the dress of little children, and girls in particular, that the weight of their clothing should be supported by the shoulders; that the entire dress should be loose about the waist, and the limbs and feet so protected as to be always warm and dry.

Lyons, Iowa.

DOMESTIC RECIPES.

Mint Sauce.

CHOP up enough fresh mint to half fill a teacup; add a tablespoonful of moist sugar, two-thirds of a teacupful of vinegar and half a teacupful of water. Let the whole stand a few hours, that the flavor of mint may get into the vinegar.

MRS. KATE BRADY.

Butter Sauce for Boiled Fish

Beat one cupful of butter to a cream with a tablespoonful, not heaped, of flour and a small teaspoonful of salt. One must judge, however, of the quantity of salt by the freshness or saltness of the butter. Chop two hard-boiled eggs into dice and put into the sauce-tureen. Just before taking up the fish, pour a cupful of *boiling* water over the creamed butter and flour, and stir over the fire until it thickens. Let it boil up and turn at once over the eggs in the tureen. Stir together and send to the table.

MARY B.

Baked Shad.

Stuff with a dressing of bread crumbs, seasoned with butter, pepper and salt, and wet with milk; sew up carefully, lay in a dripping pan, and pour over a cupful of hot water; cover and bake one hour, basting in the meanwhile with butter and water. When done, take off the cover and brown; add the juice of a lemon to the gravy, and thicken with a spoonful of browned flour. Garnish the fish with thin slices of lemon.

MRS. GARDNER.

Maple-Sugar Sauce.

Shave off half a pint of sugar; add a small teacupful of water and let simmer; add three tablespoonfuls of butter, mixed with a small teaspoonful of flour; grate in a little nutmeg, boil for a few minutes, and serve with puddings, waffles, etc.

VERMONT GIRL.

QUESTIONS ANSWERED.

Crisped Crackers.

Mrs. L. McCurdy wishes to know how crisped crackers are made.

ANS.—Split butter crackers in half with a sharp knife; butter and place on tins in a *quick* oven to brown. They are very nice served with coffee and fruit for dessert, or for luncheon with coffee and cheese.

Canning of Fruits, Corn and Okra.

New Beginner asks how to dry and can blackberries and other fruits. Also, how to can corn and okra, and which kind of cans to use, glass or tin.

ANS.—TO DRY BLACKBERRIES: They may either be spread in shallow boxes and covered with mosquito netting, to prevent flies reaching them, and left to dry in the sun and wind, protecting from rains and dew; or, to ten pounds of berries allow one pound of sugar, and enough water to just dissolve the sugar; put over a slow fire and scald; dip out the berries onto earthen-ware dishes, and boil down the juice, when a few spoonfuls may be added to each dish. We prefer to dry them prepared in this way in the oven and on the back of the stove.

TO CAN BLACKBERRIES, &c.: For preserving fruits of all kinds, we think glass jars preferable to tin, and those jars with a glass top, rubber band and a screw-ring have given with us, the best satisfaction. Fill the cans with perfect fruit, sprinkled with sugar in the proportion of one-half pound of sugar to a pound of berries; lay the glass covers on and place on straw or broken plates in a wash-boiler of luke-warm water. The water should come within an inch or two of the tops of the cans. Let come to a boil, note the time and boil twenty minutes. Draw to the back of the stove; take out the cans and if the berries be not covered with their own juice, pour in a little diluted sirup of sugar and water to fill them to the very rim; wipe the top of the can perfectly dry, put the rubber in place and screw on the ring as tightly as possible. Screw down again and again as the cans cool, causing contraction of the glass. Some prefer to cook their fruit in a porcelain kettle with sugar added in the proportion of one-fourth or one-half pound to a pound of fruit. There are several ways for preparing glass cans for hot fruit. The jars may be filled with cold water and gradually heated or placed empty in a cool oven and in that way heated. Again, many are successful and never break or crack a jar, by simply placing it on a towel wrung out of cold water and wrapped closely about, so as to exclude the air. Place a silver spoon inside and fill.

TO CAN CORN.: Cut the corn from the cob when not too old; fill tin cans and seal up by soldering on the lid; punch a small hole in the lid and place in a large pan of boiling water, which should come almost to the top of the can. Boil in this bath one-half hour, or until the steam escapes freely from the aperture. Take out and seal up with a drop of solder. Return to the hot water and boil from three to four hours. When cool, if the canning has been perfect, the ends of the can will be slightly concave.

OKRA: We have never seen or heard of its being canned, but know of no reason why it could not, as well as asparagus, beans, peas, etc.

THE HAGERSTOWN (Md) AGRICULTURAL IMPLEMENT MANUFACTURING COMPANY, are the only manufacturers of a Horse Rake with a locust hub and twenty steel teeth. They also manufacture a Grain-Seed and Fertilizing Drill, and a new "Victor" Double Clover Huller. See new advertisement in this issue.

In Murray & Lanman's Florida Water the most debilitated and nervous can find relief. Used freely in the water of the bath, its effect is almost marvelous, so strengthening and bracing, and withal so exquisitely agreeable.

The vigor of youth given to the aged and infirm by using Hop Bitters. Try it.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, April 26th, 1879.

BEANS AND PEAS.—The demand for medium beans has the tameness of spring; selected most saleable. Business in marrows is steady enough to support late figures. White kidney a shade easier; reds have again advanced. Pea beans nominal. Green peas $1 70 steady, with light receipts looked for. Southern B, E, peas, $2 50@2 55 per 2 bushel bag; Canadian, in bulk and bond, 75c. Medium beans, choice, $1 30@1 32½; fair to good, $1 15@1 25. Marrow, prime, free on vessels, $1 40; fair to good, $1 20@1 35; pea, $1 20@1 35; white kidney $1 35@1 55; red, $2 80@3 00; black, $2 15@2 25. California Lima, $4@4 25.

Receipts for week, beans, 6,816 bush.; exports, 410 bbls.; do. peas, 1,547 bush.

BROOM CORN.—Most of the offerings are of low grades; the stock is at firm prices.

Brush and short broom, choice, ₰ ℔., 5½@6½c; do. common to good, 4½@5½c.; hurl, good to choice, 3½@4½c; do., common to fair, 3@3½c.; red and crooked, 2@3c.

BUTTER.—The movement in new is quicker and steadier as quality is more in consumers' favor. Sellers dare not trifle with prices as spring weather seems to be set, and accumulation mean loss. Supplies have sold out quite clean; sales for near-by outside use adding to local wants. With better lines of State tubs and fresh Western dairy, creamery butter has dropped comparatively close to selections of other styles. No dealers express faith in better entry prices than the present ruling ones. Old has merely its former position of catch trade. Purchasers mark low for fair or season-worn grades, and are usually met by holders. Orange Co. pails will lead best demand for a time. They formerly ruled the summer, but creameries have dethroned them.

OLD BUTTER ranges at 7@12c. for State, Welsh tubs, half tubs and firkins; creamery, 10@11c.; Western June firkins, 7½@8½c.; poor to fair factory, 5@6c.; grease, 3@4½c.

NEW BUTTER.—State pails and half tubs, choice, 16c.; good to prime, 14@15c.; fair to good, 12@13c.; Welsh tubs, choice, 15c.; good to prime, 12@14c.; fair to good, 13@14c.; poor to fair, 8@11c.; State creamery, best invoices, 19c.; good to prime, 15@18c.; Western, best invoices, 18@19c.; fair to prime, 16@17c.; imitation creamery, 12@15c.; Western, dairy, fair to best, 12@13c.; factory, 9@13c.; common, 6@8c.

CHEESE.—Shipments for the week, 1°,3'9 boxes. The stock is working down slowly, but yet there is every prospect of the old supplies being well closed out within a fortnight, and the market will be in a position to receive the new make. Prices are easy, but no very sharp changes occur.

Quoted at 7½@8c. for fine lots; 6@7c. for good; 5@6c. for fair; 3@5c. for skimmed; 3½@5½c. for half skimmed. Wisconsin factory, fine, at 7c; do. good to prime, at 6@7c.; Western factory, fine 7c.; good and prime, 5@6c.; do. full skimmed, 2@3½c.; do. half skimmed, at 2@4½c.

Receipts for week, 6,850 boxes.

Liverpool cable, 49s.

Steam, 25@27s. 6d.

COTTON—Has, with frequent fluctuations, reached a higher basis, with much the same line of influence referred to latterly in the general statistical position, and the fear that the new crop will be affected by the exodus of laborers to the West. Closing prices are for April, 11.73@11.74c.; May, 11.74@11.75c.; June, 11.94@11.95c.; July 12 11@12.12c.; August, 12.25@12.26c.; September, 11.83@11.84c.; October, 11.33@11.35c.; November, 10.9.@10.99c.; December, 10.72@10.93c.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted:

	Uplands	*N. Orleans.*	*Texas.*

Strict good ordinary	10⅛	Middling	11 5-16

DRIED FRUITS.—New process apples, all grades, are lower, being plenty. Shippers are working coarse-cut stock of the best quality moderately. Raspberries are higher. Peaches are slow. Cherries and blackberries are quiet. Quotations are for evaporated apples, 10½c. for best; do. fair at 8@8½c.; State plums, 13½c; Blackberries quoted at 4½c. Peaches—Peeled Georgia, 7@7½c. for poor; 8½@9c. for fair to good; 10c. for prime; choice North Carolina, 12@13c.; good do., 9@10c.; unpeeled halves, 3@3½c. quarters, 2½@3c. Pitted cherries, 20c. Apples—New, 2½@2½c. for Southern quarters in bags; 3½@4c. for prime sliced; do., fair and good, 3@3½c.; State at 3½@4c. for new sliced; and 3½@4c. for quarters; Western at 3½@4c. for new quarters. Raspberries, 30c. bid.

Exports for week, 100 bbls. apples. A sale of 10,000 bbls. unpeeled peaches, halves, reported at 3c.

EGGS.—Receipts for week, bbls.; do. last week, 17,500. A good list of fairly cheap spring items in market calls off a good portion of trade, that would be otherwise directed to eggs. Receipts are moderate, but there is some accumulation in store, and buyers are aware of it. Duck eggs, 14@15c.; goose, 20@22c.

Near points, hen, 12@13c. doz.; State and Penn., 12@12½c.; Western, 12c.; Southern, 10½@11½c.; inferior S. and W., 10c.

FLOUR.—Slight concessions in prices gives more vigor to home trade dealings, but the exporters move slowly. There are full supplies, as the close winter extras have found more favor, and they are difficult to get, except at an advance.

Latest sales are within the range of $3 25@3 60 for inferior to very choice superfine State (fancy lots a shade higher); $3 00@3 85 for poor to good extra do., odd lots and lines; $3 85@4 15 for good to very choice do.; $3 25@3 60 for inferior to very choice superfine Indiana, Iowa, Michigan, &c.; $3 50@3 25 for very inferior to good shipping extra do., and $3 85@4 15 for good to very choice extra do.; common to about choice white wheat extras, $4 00@5 00; choice to fancy do. at $5 15@6 15; red and amber winter wheat, inferior to very choice trade and family, at $3 90@5 75; round hoop Ohio at $3 80@$4 15, selling mostly at $3 90@4 10; and trade and family brands of do. at $4 25@5 75, the latter rate for very choice; St. Louis, $4 00@5 00 for very inferior to good extra; $5 00@5 85 for good to very choice (with a few very fancy brands up to $6 50); Minnesota clear, very inferior to fancy, at $3 60@4 75, few brands going above $4 50; Minnesota "straight," very inferior to strictly choice at $4 25@5 75; and patent poor to strictly fancy at $5 25@8 50, few brands going above $7 50; unsound stock at from $2 25@5 00; city mill extra at $4 70@5 25 for West Indies (the latter rate for very fancy in new packages; chiefly at $4 70@4 90; do. for England $3 60 3 85; do. trade and family extras, $5 25@6 25; do. for South America, $5 10@5 10 for fair to very choice; No. 2 at $3 35@3 15 for poor to choice.

FRESH FRUITS.—A recent turning over of apples has shown Baldwins to have kept the best. Some fine ice-house lots are offering. These have to be used so quickly after being opened, that all retailers do not like to handle them. Spitzenburgs, $3@3 50 bbl. Greenings, $3@3 50. Baldwins $2 75@3 for fair to choice lots; sets, $2 25@2 75. Exports of apples thus far this year, 82,600 bbls.; same time '78, 14,700 do. The remnant of cranberries quoted, $7@8 50 ₰ bbl; do., crates, $1 25@3. Elegant specimens of Char strawberries are coming; some crates equal the appearance of northern summer pickings. Supplies have run liberal, and easier rates have ruled than quoted to-day. Good to prime, Char. and Fla., 50@75c.; poor to fair, 15@25c. Pecans are doing better, as retailers have stocked up to some extent. Hand-picked Va., $1 25@1 50; other, 9 @12 15; shelled, 4½@5c.)

GRAIN.—Wheat early in week was low r, but reports of drought at some western points towards the close impart more vitality to lower in winter wheats and they closed stronger; spring stock continues weak.

Latest sales are of No. 2 spring at 98c @$1 01; No. 3 spring at 90@91c.; rejected spring at 75@75½c.; ungraded spring, in lots, at 84@88c; ungraded amber at $1 07@1 10; No. 2 amber, at $1 09½@1 10, ungraded red at $1 05@1 12; No. 2 red at $1 12½@1 13; No. 3 red at $1 07½@1 08; ungraded white at $1 09@1 11½; No. 2 white at $1 09; extra white $1 13; white State at $1 11½; No. 1 white at $1 11@1 11½; New York No. 2 red, May option at 99½c.; No. 2 amber, May option, at $1 10½; do., June option, at $1 1 ½; No. 2 red, April, at $1 13 do., May, at $1 12½@1 13; do., June, at $1 13; No. 1 white, April, at $1 10@1 11½; do., May at $1 11; do., June at $1 11½. Corn has been declining but left off active at a reaction in prices; sales at the close are of New York No. 2 at 43½@43½c. afloat; New York steamer mixed at 42@42½c; No. 3 at 40@40½c.; ungraded western mixed at 42@41½c; New York No. 2 white at 43½@46½c.; New York steamer white at 42½@43½c.; New York low mixed at 43½c., and yellow Western at 44c.; New York No. 2 April at 43½c., do., May at 43½@43½c.; do., June, at 43½@44c. steamer mixed, April, at 42½@42½c.; do., May, at 42½@42½c. do., June, at 42½. Oats have declined with fair sup

plies offering: sales of New York No. 2 white at 34½c.; New York No. 2 at 31½@31½c.; do., June option at 32¼c.; New York No. 1 white at 37¼c.; New York No. 3 white at 33½c.; New York No. 1 at 32c; New York No 3 at 31½c.; white Western at 33@35c.; mixed Western at 31½@32c; white State at 34½@37c.; No. 2 Chicago in store quoted at 30½c. Barley, feeding, 46c., other grades quiet.

HAY AND STRAW.—Prime hay is wanted at spring prices, but other qualities are freely offered and are easy in price.

Sales at 40@45c. for shipping, and 70@75c. for retail qualities. Straw at 35@45c. for long rye, and 30@35c. for short rye, and oats at 35@45c.

Exports for week, 2,100 bales.

HONEY.—Comb nominally, 7@10c.; strained, 6@7c.

HOPS.—Emmet Wells says: "There has been a moderate call from brewers, but the export traffic has dwindled down to almost nothing. Prices remain the same as last quoted. Stocks are not heavy here, yet they are ample enough for the little business doing, and, with a knowledge on the part of buyers that they can fall back upon the inter or for supplies at any time when needed, no apprehension is felt of a famine in hops, and trade will most likely jog along in the usual quiet way for the next two months to come, without any important change for the better, unless the market in the meantime should become influenced by unfavorable crop reports.

Quotations are for New York's, new crop, choice, 9@12; New York's, new crop, medium, 7@8; New York s, new crop, low to fair, 5@6; Eastern, 6@9; Western, 6@9; Yearlings, 2@4; Olds, all growths, 1@2; Pacific coast, nominal, 8@12.

LEATHER.—Hemlock sole is quoted at 18@19½c. for light; 18½@21c. for middle; 18@21c. for heavy; and 16@18c. for good damaged.

MAPLE SUGAR.—Recent receipts have deprived the market of novelty, and prices are in buyers' favor. Fair to best, light quality, 7@10c.; strup, 75c. in tin.

OIL-CAKE.—Western is in better demand, quoted at $27.25@.7.50 per ton.

POULTRY AND GAME.—Supplies larger and prices falling. This market room obtains a surplus, as city killers do not operate heavily while there is a chance for steady competition in country-dressed.

Spring chicks, 75c.@$1.25 ₩ pair; N. J. fowls, 12c.; Western, 12@12½c.; Southern, 12c.; roosters, 6@7c. Turkeys, N. J., 15@16c.; Western, 14@15c. Ducks choice, 90c@$1; other, 65@75c.; choice geese, $1.50@1.75. Southern and Western, 75c.@$1.37. Pigeons, 25@40c.

Frozen poultry out of market. Prices in buyers' favor, but still good for owners.

Turkeys, best fresh killed, 19@20c.; the latter for Pa. dry-picked; other, 15@18c.; fowls, choice, 13@14c.; other, 11@12c.; capons 26@27c.; slips 23@25c.; ducks, best, 17@20c. Dry-picked spring chucks, 45@50c.; winter broilers, 30@45c.; do. roosters, 21@22c.

The game law stops the sale of wild ducks after May 1st. Shot pigeons $1@1.37. Pigeons in good demand with scant other game.

English snipe, $1@1.12 ₩ doz; plover, 90c.@$1; small snipe, 30@40c. Wild pigeons, $1.75; canvas backs, 75@90c.; red head, 50@60c.; mallard, 35@45c.; black, 35@40c.; common, 15@25c. Season most over for wild ducks. Tame squabs, ₩ doz., $2@2.50.

PROVISIONS have tended higher with a freer demand for supplies. Mess pork quoted at for old mess on the spot for ordinary at $9.12½@9.25, and new mess, ordinary, at $10 25 10 10 and $10 15 asked for new for April May at $10 10 bid and $10 15 asked; June at $10 20 bid and $10 30 asked; and July at $10 25 bid and $10 40 asked. Bacon at $5 for long clear and 5 3-16 for short clear. Lard—Western steam, at $6 27½ for spot lots; 6 25 for May; $6 32½ for June; and $6.37½ for July. Beef hams at $17@18.25. Stearine at 6¾@ ¾c. for best. Tallow at 6½c. for prime. Beef—Extra India mess, $20@22, as to quality; packet, $11@11.50; plain mess, $9.75@10.50; extra mess at $10.50@11.50.

SEEDS.—Grass are slow; clover quoted, 6@6½c. for prime and 6 @6¼c. for choice Western. Timothy at $1.35.

SUGAR.—Refined at 8¾@8½c.; for cut loaf and crushed, 8½@8¾c. for granulated and powdered; 7¼@8c. for soft white and 6@7¼c. for soft yellow.

TOBACCO.—Export movement is higher, and the inquiry from the home trade slack, with prices steadily held.

VEGETABLES.—Exports potatoes since Jan. 1st 49,041 bbls., do. '78, 76,217. Market fairly firm. Warm weather has started some sellers in the inside rate, but very choice stock is unchanged. Southern truck abundant and in good demand. Early Rose and Eastern, $3 50@3 75; State, choice, at $2 75@3 25; fair to good, $2 50@3; Peach Blow, white, in bulk, $3@3 50; red, $2 75@3 25; Prolific, $3; Peerless, State, $2 37½@2 75; Jackson White, $2 75@2 87; (outside rate per double heads). Sweet potatoes, Md. & Del., $3 50@3 75. Onions, red and yellow, $2 75@3 25. Squash, marrow, $3 50@4 00. Cabbages per 100, $6@10; R. turnips, per bbl., $1@1.25; beets, 75c.@$1 00; carrots, $1@1 12. Horseradish per bbl, $6@7 Southern items—String beans, Fla., per bush, cr., $2 00@3 50; green peas, Chas. and Sav., small, $1 50; asparagus, Chas. and Norfolk, doz. bunches, 50@75c.; kale, $1 75; Baltimore, ₩ bag, 75c @$1; spinach, Baltimore, ₩ bbl., $2 00@2 25; radishes, Norfolk, ₩ 100 bunches, 25@75c.; cabbage, Sav., new, ₩ bbl., $3 00@3 50; Fla. cucumbers, crate, $3@6; onions, Bermuda, ₩ crate, $1 25@1 50; tomatoes, box, $1 25@1 50, potatoes, $8 Hot-house rhubarb, ₩ 100 bunches, $4 00@6 00.; radishes, ₩ 100 bunches, $4@6; cucumbers, large, ₩ doz., $1 50@2 50; mushrooms, ₩ lb., 50c.; lettuce, selected, 37@75; ₩ doz.

WOOL.—There has been a very sluggish market this week, and prices have ruled easy on account of the advanced season to the new clips.

Ohio, Pennsylvania and Virginia—XXX and picklock, 36@37½c.; XX, 34@34c.; X, 33@34c.; No. 1, 33@35c.; No. 2, 32@33c; common, 28@30c.; combing, 36@ 38c.

New York, Michigan, Indiana and Wisconsin—XX, 30@32c.; X, 29@31c.; No. 1, 31@33c.; No. 2, 27@30c.; common, 26@28c.; combing and delaine, 34@37c.

Iowa, Vermont and Illinois—X and XX, 28@30c.; No 1, 30@33c.; No. 2, 27@28c.; combing, 33@36c.

Missouri, Kentucky and Tennessee—Washed fleece, 30@33c; unwashed fleece, 18@21c.; unwashed combing, 22@25c.

LIVE STOCK MARKETS.

BEEVES.—Receipts for the week, 9,629 head; do., last week, 8,084 do. The market lulled on Wednesday, and has not revived since. Buyers aim to keep their stock down to a sure selling limit, as the weather is bad for meats that cannot be readily protected. To-days steamers take out 520 quarters beef. Light, medium steers sold at 9@9¾c. ₩ lb., to dress 56 lbs.; fair to good do., including several car-loads of Colorado cattle at 9¾@10c., to dress 56 lbs., and prime steers at 10¼c., to dress 56@57 lbs. And a car-load of fat, still-fed bulls changed hands at 8¼c. ₩ lb., live-weight. Exporters were not operating.

COWS AND CALVES.—No new features; the style of stock arriving ranges, $30@50. No inquiry for fine milkers.

VEAL CALVES.—Market decidedly lower; 4¼c. is seldom quoted as the top for live. N. J. and Buck's Co., 4¼c.; good do. and best State, 3¾@4c.; other grades, 2½@3c. Hog-dressed best, 5½@6c.; fair to prime, 4½@5c.; common, 3@4c.

SHEEP AND LAMBS.—Receipts for the week, 20,823 head; do. last week, 20,145 do. Demand moderate, but supplies not heavy enough to force concessions from sellers, quoted, 5½@6¼c. for wool sheep and $4.25@5.70 for clipped. Selections of Ohio have sold for England. Lambs, fair to choice, $@$ head; common, $2@3.50.

SWINE.—Receipts for week, 28,923 head; do last week, 30,904 do. Firm at the close at $3.75@4 ₩ 100.

Country-dressed pork, light, 6@6½c.; medium, 5½@6c.; heavy, 5@5¼c.; city, 5@5½c. Pork tenderloins, &c.

New Advertisements.

FINE TEAS supplied to *consumers* at prices *lower than ever known before.* These *fine qualities* seldom reach the interior, being sold only in large cities and among the very wealthy. Send for *reduced price-list*, and compare with other houses.

IMAGINARY TRAVELS.

MY DEAR NIECES AND NEPHEWS:—A very clever Frenchman, a long time ago, diversified the humdrum of life by falling ill, and indulged in the excitement of trying how near he could approach Death without actually falling into his skeleton arms. During his convalescence time dragged its slow length along, and to break the tedium he amused himself by imagining that he was making a series of the most delightful voyages. He would select some familiar object in the room—a chest of drawers, for example—and the wood of which it was made readily suggested the country in which it grew. Here, then, was the vehicle; it only remained to equip it with the wings of fancy, and the sick man was instantly leagues away in some delightful land, where "it was always afternoon." By the time he had become well again he had made many such trips, and exhausted the resources of the room. He published an account of his fanciful wanderings, under the title of "Travels Around My Room" (*Voyages Autour de ma Chambre*), and to this day De Maistre's is one of the most entertaining books in the French language. Anglo-Saxons are restless beings. From the earliest times they have indulged their propensity for roaming, and there are few places that the intrepid Englishman or inquisitive Yankee has not visited. The result is that those whom circumstances compel to remain at home have at their command a very extensive library of travel, that, rightly used, can be made to yield almost as much enjoyment as if the reader had visited personally the scenes described. Few, to use a mining term, do more than work a surface claim in this mine of amusing and instructive knowledge. The greater number, even of the shoals of tourists that annually leave our shores for foreign countries, go and return with no addition to their information. The most lasting souvenir of Paris is the memory of a good dinner at the Cafe Anglaise, or the splendid bargains in silks to be had at the Bon Marche, while they are within a few minutes' walk of the Place Vendome, without thinking or taking the trouble to learn anything concerning the stirring events commemorated by the column that adorns the locality.

What I wish to suggest from the foregoing, my dear young friends, is that we, perhaps, may travel at home in imagination, with almost as much pleasure, and certainly more profit, than scores of our envied friends who make the Grand Tour. Our preparations for the voyage need *not* include an infallible remedy for sea-sickness, but our luggage should comprise a good atlas, a traveler's hand-book (Harper's European Hand-books are as good as any), and books of travel that are explanatory of the places we propose to visit.

It has been wittily said that most good Americans when they die, go to Paris. We will do better; we will live and travel farther. We will make incursions into lands where there are dates not half so dry as those of history, mount camels and ride over arid wastes without incurring the expense of a dragoman; experience a fair amount of the pleasure of a trip up the Nile and go to Rome, staying as long as inclination prompts with no uneasy forebodings that our letter-of-credit has become exhausted, or that the malaria is dogging our footsteps.

Aside from the pure pleasure of such an imaginary tour, the young traveler, with the aid of atlas and itinerary, has had photographed on his mind a clear impression of many countries, physically, politically, and socially. He will be able to talk entertainingly to his friends, and he will form habits of study and reflection, that will always be a safeguard against senseless and mischief-making gossip.

My idea is to suggest a tour, naming the points to be visited, rapidly sketching the principal historical and physical features, and then giving a list of the books to be consulted for extended descriptions. After the lapse of sufficient time, the RURAL would expect an account of the trip in the shape of correspondence, embodying the result of what had been learned concerning the places, with reflections suggested by books perused.

Perhaps this little plan may not appeal very strongly to my relatives. In that case we will not travel this summer. If, however, you care to embark with me, I shall expect you to apply for passage not later than May 17th, and those who conclude to go, must promise to remain with me until the voyage is ended. We will send an account of our journey to the RURAL, that the lazy boys and girls may read of the good times we are having, and be envious accordingly. While we are becoming bronzed by foreign suns, (through the medium of the library), Uncle Mark may cheer us with moral disquisitions on the advantages of having a "good time."

I shall not start with less than a party of fifty of my relatives. UNCLE TRUE.

A TRIP TO THE WOODS.

IN every-day life, it is often the case, that people have golden opportunities and precious pearls, lying at their feet, which can be had for the trouble of picking them up, but are rejected from the very ease with which they can be obtained; while something of much less value, but beyond reach, is eagerly grasped at. So it is with our flowers. There are many treasures in the woods and meadows, which we perhaps pass by daily without giving them the least attention, while we seek the pets of the garden that are more difficult to obtain, but otherwise may be no better than their sisters of the fields. I have thus seen plants cultivated in greenhouses in Europe, that may be found on every field and by ever roadside here in America. Among others the very common Poke or Garget Weed, *Phytolacca decandra*. If the members of the club are willing, we will cast aside this prejudice and take a trip into the woods and meadows on one of these fine days of early May, in search of flowers. Each member must provide him or herself with a pair of thick boots, a small spade or a trowel, and a basket in which to carry home the plants. In meadows and near streams in sandy soil we may find our four wild species of Lilies, all well worth cultivation. The leaves are of a light-green color and grow in whorls or circles around the stem. In June and July they bear large bell-shaped flowers that vary in color with the species, from a light yellow to scarlet. The Canada Lily (*Lilium Canadense*) grows two to five feet high with spotted flowers. The American Turk's Cap (*L. superbum*) is also spotted within, of a red color and grows from four to six feet high. There are still two others found mostly in the South. If planted in the garden now and supplied with water, they will bloom during the summer.

The violet family has a great many representatives in the fields, that may be grown in the garden. They bear white, yellow and blue flowers. The Pansy and Sweet Scented Violet belong to the family; it will aid you in finding the wild ones if you study the appearance of these. They are of low growth, some of them creepers and nearly all bloom in April and May.

Among the Lobelias are also several worth cultivation, especially the Cardinal Flower (*Lobelia cardinalis*). It grows along streams and in low places, throwing up a stem two to four feet high, which bears large, showy, dark red flowers. The Virginia Creeper must be well known to all of you. It is one of the handsomest vines found in the temperate zone and ought to grace every farm-house in America. Dig up young plants and plant them near the wall of the house, or by some old cedar trunk in the garden. Tie the vine to the wall or trunk till it gets a good start, then it is usually able to hold itself up. It can also be used to inclose your gardens. Plant young plants about a foot apart, and with hooks keep the vines in place on the ground. I must here caution you against mistaking Poison Ivy (Poison Oak) for this beautiful climber, as people who are not good observers, will sometimes do. Poison Ivy has *three* small leaves (leaflets) on each leaf-stem (petiole), while Virginia Creeper has *five* leaflets.

The Columbine (*Aquilegia*) is also a handsome flower for your gardens. It grows about two feet high and blooms in spring and early summer. It is common in rocky woods.

The Marsh-Marigold, sometimes called Cowslip, which blooms in marshes in the spring, the little blue Forget-me-not, found near streams, and many others may be gathered; but those named will be enough for our first trip. Dig them up carefully with a ball of earth adhering to the roots, and when planted, shade them from the sun for some time. You can find many others worth planting. The real lover of plants sees beauty in every flower. Above all, you should strive to become good observers. Use your eyes well. When a flower, leaf, or plant attracts your attention, notice how it looks; its color, shape and manner of growth, so you can recognize it when you meet with it again in some other place. To use the senses well forms the basis of all scientific investigation, and is a privilege open to everybody, yet how few persons there are who improve this privilege.

PEANUTS.

All of my relatives are, no doubt, acquainted with peanuts, as at least one stand for the sale of this article may be found in every village in the country. Some of you may have sent envious glances at the peanut-man who, of course, can eat as many as he pleases while standing all day behind his little counter, cheerfully turning the crank of the steaming retort. You need not be envious, however, for you can raise enough yourself to roast and eat, and besides learn something about the curious manner in which these nuts grow. Fill three-inch pots with light, loamy soil, and plant one nut in each, about an inch deep, first cracking the shell, but do not remove it. If the pots are set in a warm place, the nuts will soon sprout. In the latter part of May or the beginning of June, thump out the plants and set them in a warm, sunny place in your garden, and watch their growth. The plants bear small yellow flowers, and when these drop the pistils elongate, pushing themselves into the ground where the nuts are formed. If in its growth the pistil strikes a stone, a piece of board, or for any reason it is prevented from entering the ground, no fruit will be formed, showing that though the nut is a real fruit, the result of a flower, it is still necessary for it to develop in the ground like a potato.

UNCLE MARK.

EARLY VINES.

A HINT to those who are desirous of early melons, tomatoes, cucumbers and squashes will be of value, I think. Go to a pottery and have a hundred or two hundred small pots, two inches across the top and one at the bottom. Plunge these in your cold frame or hot-bed, in rows; fill with dirt, and put two seeds in each one. If both come up, destroy one. Let them grow here till the second or third leaves show; then transplant to their hills in the garden. The advantage is that you can transplant vines without disturbing the roots or checking growth. Lima beans and vines are especially in need of some such method. In this way a month of growth can be secured from middle of April to middle of May. The vines will then be out of the way of bugs before they appear. Nast can picture the surprise of the striped bugs when they find themselves too late for breakfast.

This method is quite superior to the use of inverted sods. It is, of course, understood that beans and vines cannot be started in a hot-bed in the usual way. It is better even for tomatoes, peppers, cauliflowers, &c., to start them in pots. The cost of the pots will not exceed two dollars a hundred, and they will last, if well baked and stored properly when out of use, for ten years. I have them in use since 1867, and three-fourths are still sound.

It will still be well to make sure against all failures by having on hand a few boxes, with mosquito netting closely tacked over the top. Press these down over the transplanted hills. Most of the advertised plant protectors are perfectly reliable. P.

PATCHES AND HEROES.

"THREE! four! five! How funny!" cried the girls. "Hurrah!" shouted the boys. What were they counting? Yes; the patches on poor little Constance's dress. She heard every word and the boys' loud laugh. Poor little heart! At first she looked down, then the tears came with a great rush, and she tried to run home.

"Cry-baby!" said the boys.

"Don't want her to sit next to me," said Ella Gray.

"What right has she to come to our school?" whispered proud Lily Gross.

"There! don't mind a word they say," exclaimed Douglas Stewart, leaving the group of rude boys and trying to comfort Constance. "Let me carry your books," he continued. "Cheer up! It is only a little way to your home, isn't it?"

Constance looked up through her tears to see the bravest boy in school at her side.

"I live in the little house under the hill," said Constance. "It isn't like your grand house."

"No matter for that. It has pretty vines, and climbing roses, and it's a very nice house to live in," said Douglas. "I dare say you are happy there?"

"Yes; I don't want to come to this school again," said Constance, softly.

"Oh, things will be all right in a day or two," said the boy, kindly. "Never mind them just now."

They had been talking of heroes a little while before; they had been wishing to be like Alexander and Cæsar and Napoleon. There was not a hero among them except this same Douglas Stewart, who dared to stand out before all his schoolmates and befriend this poor, forlorn little girl.—*S. S. Visitor*.

HIDDEN GULFS.

1. 'Tis his mat I assure you.

Sabbath Reading.

"THE COURT OF JESUS CHRIST."

ALTHOUGH "church courts" are a thing quite unknown to the New Testament, they are sometimes justified upon the ground of their practical advantage in making all things to be "done decently and in order" in cases of discipline. The court recently in session upon the case of Mr. Talmage, Brooklyn, can certainly not be cited as an example in proof. Here is a glimpse of its proceedings:

"There was one very ludicrous scene, when the Moderator tried, during one of the pauses in the middle of the drollery, to have a hymn sung. The opening line of that which was suggested, "Blest be the tie that binds," fairly brought down the house, and a suggestion of the Lord's Prayer was equally mirth producing. But nothing excited so much merriment as the Moderator's proposal that, on the failure of the hymns, they should pass a few moments in "sacred silence." This was more than the audience could bear, and they doubled themselves up with laughter."

The wranglings and bickerings of the counsel were equal to those of any police court; and the whole thing a farce and disgrace, not alone to the Presbyterians, but to the Christian name, and ought not to be permitted to pass without general rebuke. These outrageous proceedings, be it remembered, took place in a tribunal whose official title is "the court of Jesus Christ."—*The Standard*.

PRESS ONWARD TOWARD THE MARK.

CERTAINLY if there is any man in the world who has a right to look for success and to go forward with the assurance, that success though delayed, will come at last in answer to persevering effort, it is the man who puts his trust in God, and uses all the appointed means with diligence to the end. If other men, by mere force of will, bending all their energies through life to the accomplishment of a single definite purpose, have succeeded at last in winning triumphs which have sent their names down through history with honor, what incouragements has the Christian to attempt great things and to expect great things, ever knowing that while he works, it is God himself who is working in him and by him! In this battle of the good against the evil, no true labor is ever lost. In the battle of truth and right, which is always God's own battle, as well as ours, success is bound to come, success is assurred from the beginning. In this battle, all we have to do in order to feel the inspiring incentive of certain victory at last, is just to know that we are on the Lord's side, and then to fight on manfully to the end. And what if we fall in the conflict? It is only to wear the crown of success at last.—*The Interior*.

"BEHOLD YOUR KING."

Go back to the day of the Crucifixion; follow the feeble and faltering steps of the Victim as He passes through the streets of Jerusalem on His way to Calvary; witness the scene of torture and ignominy which followed. Is this the King that was promised? Is this His coronation? All experience all history, all our affections answer, "It is." To a suffering, and not to a triumphant Christ the thoughts of a tempted, perplexed and sorrowing race instinctively turn. It is the memory of that love which was stronger than death, mingled with the consciousness that the sacrifice had become necessary to our reconciliation with God, that has enthroned the Crucified One forever in the heart of man.—*Dr. James Walker*.

AN evil-minded and malicious professor of religion always appears worse to the public view than an evil-minded and malicious person who is not a professor of religion. This fact has often attracted attention, and it is attributed to a contrast between a black life and a white profession. But there is certainly more in it than this. One who has been trained in the doctrines and morals of the gospel, when he gives way to envy and malevolence and hate certainly can exceed depravity, in its crude state, in all the arts of those evil passions, and he scarcely ever fails to do it. Like a wandering star, the greater distance the fall the profounder will be the plunge. It took Lucifer, Son of the Morning, the brightest star in heaven, to become that ineffably contemptible criminal, the Devil. So it takes a professing Christian, when he surrenders himself to evil and malevolent passions, to excel all other men in evil conduct.—*The Evangelist*.

SAY, what is honor? 'Tis the finest sense
Of justice which the human mind can frame,
Intent each lurking frailty to disclaim,
And guard the way of life from all offense
Suffered or done. *Wadsworth*.

WE picture death as coming to destroy; let us rather picture Christ as coming to save. We think of death as ending; let us rather think of life as beginning, and that more abundantly. We think of losing; let us think of gaining. We think of parting; let us think of meeting. We think of going away; let us think of arriving. And as the voice of death whispers "You must go from earth," let us hear the voice of Christ saying, "You are but coming to me!"—*Norman McLeod*.

FOR a long time I felt myself to be a lost sheep, not knowing on whom to rely; and now, with the deepest consciousness that I have at last attained rest, I exclaim, "The Lord is my Shepherd. What is there that can harm me?" And as I look forward into the future, I exclaim, with David, "I shall not want."—*Tholuck*.

SO surely as the day and the night alternately follow one another, does every day when it yields to darkness, and every night when it passes into dawn, bear with it its own tale of the results which it has silently wrought upon each of us, for evil or for good.—*W. E. Gladstone*.

PERSONAL ITEMS.

Alexander H. Stephens was so poor when he commenced the practice of law, that he had to live on $6 per month.

Gen. "Dick" Taylor, son of President Zachary and a brilliant confederate leader during the civil war, died Saturday week in New York where he was visiting, at the age of 53. Richard Taylor studied at Edinburgh and graduated at Harvard in 1854; he was for a time his father's private secretary in the campaign in Mexico, and became a planter in Louisiana, his native State, soon after. He was the most fiery of secessionists when the time came, distinguished himself in the Shenandoah valley and elsewhere, but especially in his defeat with 8,000 troops of Banks with 40,000, near Mansfield, La., in May, 1864; and when the Confederacy surrended he was lieutenant-general in command of the department of Alabama and Mississippi. Gen. Taylor was a richly gifted, attractive and companionable man, so that he had very many warm friends; he was brave, honest and enthusiastic, and a most conscientious rebel; he thought that he was a competent historian, and has acted accordingly in magazines and now in a book. But while death removes him from the temptation to write bad history, it also deprives the country of one of the brightest minds and best fellows it contained.

Parents, do not use vile drugs or nostrums in your families, but use pure Hop Bitters.

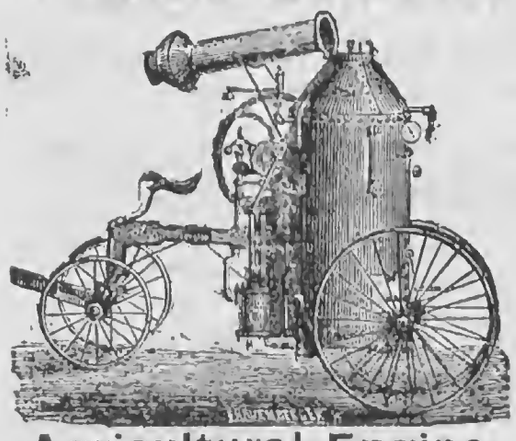
BATAVIA "MONITOR"



Agricultural Engine.

Most powerful for its weight of any Engine built. Simple, Strong, Durable and Safe. Requires no Leveling, and is Complete in all its parts. Illustrated Circular and Price List sent on application to

BATAVIA PORTABLE ENGINE CO., Batavia, N. Y.

Implements and Machinery.

COOLEY CREAMER

Supersedes large and small pans for setting milk.

It requires no milk room. It requires capacity for one milking only.

Impure air, dust or flies cannot reach milk set in it.

It makes more butter, because it raises all of the cream, and the quantity is never lessened by unfavorable weather.

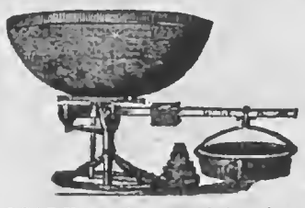
It makes better butter. It requires less labor. It is cheaper.

Butter made by this process took the HIGHEST AWARD at the INTERNATIONAL DAIRY FAIR—and brings the highest price in all the great markets.

☞ Send stamp for the DAIRYMAN to

Vermont Farm Machine Co., Bellows Falls, Vt.

A Perfect Butter-Salting Scale.



Every pound of butter salted alike. Salts from three-quarters to one and a quarter ounces to one pound of butter. No MISTAKES. Will WEIGH ANY ARTICLE, from ½ oz. to 64 lbs. No Dairyman or Butter-Maker should be without one of these SCALES. Warranted to give satisfaction, or money refunded. Sent C. O. D., or on receipt of price—$5. Send stamp for Circulars. Address

The Blessing of Strong Nerves

Is recoverable, not by the use of mineral sedatives, but by a recourse to effectual tonic treatment. Opiates and the like should only be used as auxiliaries, and then as sparingly as possible. Vigorous nerves are quiet ones, and the most direct way to render them so is to reinforce the vital energies. That sterling invigorant, Hostetter's Stomach Bitters will be found all-sufficient for this purpose, since it entirely removes impediments to thorough digestion and assimilation of the food, so that the body is insured its due amount of nourishment, and consequently of stamina. Rheumatic tendencies and affections of the kidneys and bladder are also counteracted by the Bitters, which is besides a pleasant medicinal stimulant, infinitely purer than the raw excitants of commerce, which react injuriously upon the nervous system.

Lord & Taylor

Colored Silks.

WE INVITE ATTENTION TO OUR LINES OF NEW SILK GOODS, SATISFIED THAT A CAREFUL EXAMINATION AND COMPARISON WILL RESULT IN THE OPINION THAT WE REPRESENT OUR GOODS EXACTLY AS THEY ARE.

WE HAVE A FINE ASSORTMENT OF **LOUISINES**, IN ALL THE NEW COMBINATIONS OF COLORS, SHOWING VERY PRETTY DESIGNS.

QUADRILLE CHECKS, IN BRONZE, SAPPHIRE, NAVY BLUE, GOLD MIXTURE, PEACOCKS, &c., &c. THESE GOODS HAVE FINE DAMASSÉ EFFECTS, WILL NOT CRUMPLE OR WRINKLE, AND EMBRACE A GREAT VARIETY OF VERY CHOICE PATTERNS.

SATIN-FACED FOULARDS, COMBINATION STRIPES, WITH PLAIN FOULARDS AND SILKS TO MATCH. ALSO, SATIN-FACED FOULARDS, IN ALL THE SHADES AND COLORINGS, WITH WHITE POLKA DOTS. ALL DESIRABLE GOODS.

NEW LINES OF **PLAIN COLORED SILKS**, IN ALL THE MOST FASHIONABLE SHADES AND COLORINGS, WITH DAMASSES TO MATCH FOR TRIMMING COMBINATIONS.

ALSO,

Black Silks,

OF ALEX. GIRAUD, LYONS, MANUFACTURE. THESE SILKS ARE OF STERLING VALUE, AND THOUGH OFFERED LOW, ARE VALUED AT A MUCH HIGHER FIGURE THAN THE FOLLOWING, AT WHICH THEY ARE OFFERED:

21 inches, $1.25 per yard.
24 inches, $1.30 per yard.

THESE SILKS ARE EXHIBITED AT THE BROADWAY ENTRANCE,

ALSO, A SPECIAL GRADE OF THE

Lord & Taylor Family Silk,

WHICH WE HAVE DECIDED TO OFFER FOR THE NEXT THIRTY DAYS AT THE EXCEEDINGLY

Low price of $1.50 per yard.

THE L. & T. BLACK SILKS ARE REGULAR WIDTH, AND FULLY GUARANTEED FOR WEAR. IN THIS GUARANTEE WE HOLD OURSELVES READY TO REPLACE YARD FOR YARD ANY NOT WEARING AS REPRESENTED.

WE CONFIDENTLY INVITE A CRITICAL EXAMINATION OF THESE GOODS, FEELING THOROUGHLY SATISFIED THEY ARE THE CHEAPEST IN THE MARKET.

PLAN FOR A CREAMERY.

A CORRESPONDENT asks for a plan for building a creamery, with information as to appliances, furniture and method of working. Just now there is considerable attention given to this subject on account of the low price of milk and cheese. We consider it of doubtful utility to "change horses when crossing a stream," and just now farmers are certainly in the water up to their chin, and some are in danger of going under. Perhaps it might be well to consider how far greater economy and effectiveness in the management of present business might avail to better one's condition, rather than risk the hazardous experiment of a change just now. But there are doubtless many who could well consider economy and effectiveness in connection with the use of a creamery, as there is certainly no other method of handling milk and cream for butter-making so cheaply and efficiently as in a creamery.

A creamery will cost from $1500 to $3,000 fully furnished for 150 to 600 cows. It is obvious to one with but inconsiderable experience, that the cost is in a smaller ratio the larger the creamery may be; a small one may cost $10 per cow, while one four times the capacity may cost but $5 per cow.

The building may be plain, but should be made with double walls having an air-space between them for the purpose of keeping the temperature even, although with the present methods of keeping milk in refrigerator vats or coolers, the temperature within the factory may become of secondary account. A house with a wing would probably be the most convenient, as it would furnish room for the creamery in the main building and for the cheese factory and store-room in the wing. The upper floor of the main building would serve as living apartments for the dairy people. The plan would be something like that shown at fig. 1. The main building (*a*) would be 75 feet long by 25 feet wide for a large creamery, and 50 by 16 for a small one, and the wing (*b*) 50 by 25 feet with an engine-house (*c*) as shown. A covered drive-way (*e*) is at the front, where the wagons deliver the milk. The milk is received on to a platform where it is sampled and weighed, and then run through a long tin spout into the vats in the milk-room (*a*). It is necessary to sample the milk of each patron, so that it may be tested as to its quality each day in the usual test glasses, or cream gauges. It is obvious that in a creamery the value of the milk is regulated by its richness, more or less, in cream.

When in the vat the milk is cooled and left for the cream to rise. It is then skimmed and the cream taken to the churns in the butter-room (*d*), where it is made into butter in whatever churns may be selected, these being operated by a belt from the engine in the room *c*, in the rear. A rail track is laid around the milk-room and into the butter-room *d*, upon which a light car can be run for the conveyance of the cream to the churns. Two churns should be provided. If the common dash churns are chosen, these are operated by a rocking arm attached to a crank; if rotary churns are used, a pulley on a shaft placed between the two, as shown, will convey the required motion. After the milk is skimmed, it is pumped into the vats in the cheese-room, where it is curded, and where the curd is prepared for the press. An elevator is placed in one corner of the room by which the cheeses are conveyed to the curing-room above. An ice-house (*f*) is to be provided and supplied with a sufficient stock of ice for use in the summer. This should have a communication

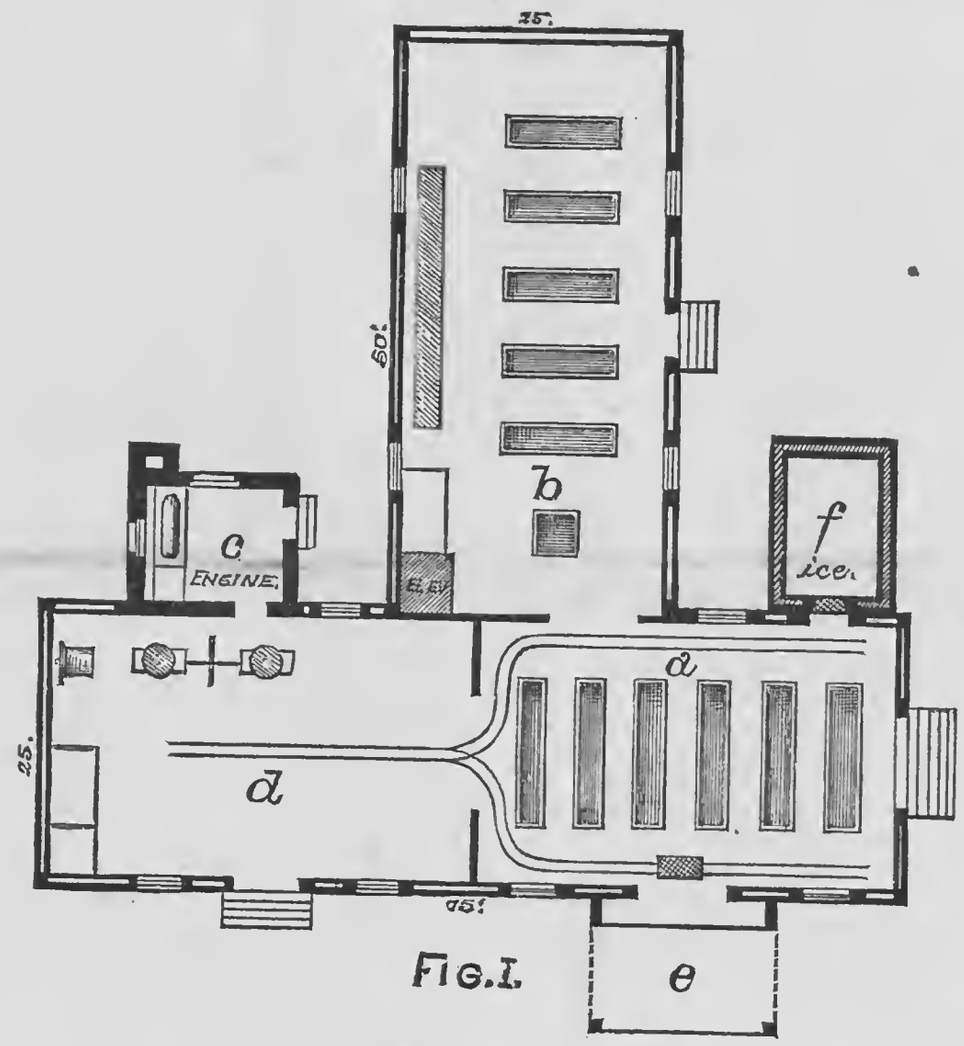

FIG. I.

CREAMERY.—GROUND PLAN.

with the milk-room for convenience in procuring ice, and the rail track may be laid to the door. The elevation of a building suitable for the purpose is shown at fig. 2.

A three or four horse-power engine and boiler are sufficient to furnish steam for heating, and for doing all the mechanical work. The methods of operating a creamery and cheese factory, which should be worked in conjunction, are varied according to circumstances, and the amount of capital that is invested. The most economical and profitable methods include all the labor-saving appliances and the most effective processes for securing quality in the product. It is in the proper use of these that the advantages lie, which turn the balance to the side of profit. For instance, in a recent case which comes to our knowledge, a part of the milk which was operated under the best of the ordinary methods, returned $1.21 per 100 pounds, while the remainder worked up under an improved process, returned more than $1.50 per 100 pounds. It is obvious that we cannot here describe these different processes; but those whom it may concern can easily become acquainted with them by visiting a few of the best creameries, which can be pointed out if required hereafter. For before investing in a new enterprise in which skill is needed to make capital productive, one should always seek the practical information obtainable only by inspection of similar undertakings successfully conducted.

FIG. II.

CREAMERY.—Elevation.

Dairy Husbandry.

THE RAISING OF CREAM.

O. S. BLISS.

SEVERAL days ago my attention was directed to an article in the RURAL of the 29th ult., entitled "The Raising of Cream," but the pressure of more immediate duties has prevented even the reading of it till this sitting. I can ill afford the time for a discussion of the subject, and but that a very earnest appeal has been made to my duty to the dairy interest to do so, I should insist on being excused from it. The writer truly says there has been a great striving to understand the true principles of cream rising, and a detailed account of the labors and studies in that field would supply matter for the dairy columns of the RURAL for more than fifty-two weeks.

A fundamental error of most of these "strivings" is indicated by the term "cream rising" or the "rising of cream." There is no such thing as "cream rising." Cream in common with all other matter is inert and cannot act or move except as it is impelled by some external force. Cream does not rise but is raised. The object of these "strivings" should be to determine what force does actually raise the cream and what influences may economically be brought to bear upon it to render it efficacious.

One prominent source of error resulting from experimenting in this department, is the standard of judgment in testing results. To illustrate: I am reported as saying at one of the Utica meetings this winter, that I always used the same quality of milk in making my experiments. I did not say any such thing. But, in answer to the question how many pounds of milk it would take to make a pound of butter by a certain described process, I said that I never applied that test on account of the variable quality and condition of milk, depending upon breed, feed and other circumstances; that I esteemed it, with possibly one exception, the most fallacious of all tests; that in all my operations the test was applied to the quality of the residuum; that this was not determined by setting the skimmed milk aside to see if cream would rise on it after it had been treated for cream, and often so treated, that the cream could not rise, however much there might be of it; but by the most exact scientific method available to practical men in their own dairies—the determining of the specific gravity by actual weighing in a properly-adjusted bottle and with a delicate balance. This test covers the whole ground, whereas the amount of cream or butter produced, however large, may still be only part of the whole, and lead to erroneous conclusions.

The writer of the paper under consideration asserts that "pure cream is simply ungathered butter," and that the mechanical gathering of the cream makes butter. There are chemists and microscopists who hold to the same opinion; but the preponderance of opinion on the part of this class of observers, is very largely in favor of the theory that the butter globule is surrounded by a pellicle of nitrogenous matter. The various specific-gravity determinations of milk, cream, butter and butter-milk, strongly corroborate that view, and the quality of the butter-milk fully confirms it. If the merely mechanical gathering of the butter were the whole of churning, there would be no material

difference between the skim-milk and the butter-milk; whereas, under every circumstance in which butter is produced, whether from new or old milk or cream, the quality of the residuum is very different from skim-milk. It has been reported the past season, that there is a cow in Ohio whose cream is pure butter. I would go farther to see such a cow than to see all the elephants, white-mice, *et cetera*, that Barnum ever owned.

The writer discusses specific heat. He says: "For under this law when milk is rapidly cooled, the cream globules cool faster than milk." The fact is, milk absorbs or radiates heat much more rapidly than cream, as I have proven by hundreds of experiments, while the capacity of cream for holding heat—technically known as its specific heat—is *said to be* greater than that of milk. This is only an apparent contradiction which, though not inexplicable, must be passed over at this time.

The theory that currents in milk obstruct the raising of cream, and that only an uniform temperature is effective, is in direct conflict with the facts in the premises. Cream is raised by the effect of gravitation, but not when the influences affecting this law are conflicting. There is good authority for saying that the whole of cream is never raised by the best method. Few persons appreciate the waste attendant upon the most popular of these. Milk freshly drawn from the cow, at blood heat, is in its best physical condition for separating out its cream under the operation of gravitation; but, kept at that temperature, it will not do it. If the milk be kept from parting with its cream by agitation, and the temperature be raised or lowered to the "fixed and uniform temperature" of the writer, no matter what it may be, and then set till Doom's-day, it will not part with its cream. Different milks act differently under such circumstances. All will throw up some of the cream; a few will throw up a considerable part, but none will throw all or nearly all.

Cream rises best under a falling temperature, and much better when cooled at the top than when cooled either at the bottom or sides. There is nothing mysterious about this either. It is in strict conformity to natural laws. When uncreamed milk is cooled, the milk, or serum, parts with its heat much more rapidly than the cream, and is contracted first, and the difference in the specific gravity of the two is increased, favoring the rising of the cream. But when the cooling influence becomes "uniform and fixed" the opposite effect is produced. The actual expansion of cream under the influence of heat, or contraction under the opposite influence, by the change from one "fixed temperature" to another, averages about as two to one in skim-milk.

If the milk is cooled at the top, as it is to a greater or less degree, of necessity, in all the quick systems, uniformly favoring currents are established throughout the mass under the law of convection; whereas, bottom cooling tends to impede this favorable action, but does not entirely prevent it on account of the specific levity of the larger globules of the cream. Side-cooling induces a system, or rather two systems of cross currents, one inward at the bottom, and another outward at the top of the mass, which to a greater or less degree, according to several circumstances, counteract the favoring influence of direct vertical currents.

The theory that cream is carried down by the descending currents, is untenable. It is due to the failure of the theorist to distinguish between the force of a stream flowing along, as a river between its banks, and the mere interchange of position between particles of a mass in a close vessel. The downward current is produced by the excess of the force of gravitation exerted upon one portion or particle of the mass over that exerted upon another lighter one, lying lower down in the mass, which must give way and move upward before the first can go down. Gravitation always acts downward, but there can be no downward motion or current without a corresponding upward current and *vice versa*. If the particle of milk going downward could attach itself to the lighter particles of cream, it would by this means buoy itself up as often as it would carry the cream down. There is, in milk, a sort of viscidity which prevents the free motion of the particles among one another, and which is a great obstacle to cream raising; as the temperature falls it is intensified, but it does not amount to any such attaching force as is implied in this theory. On the other hand, the action of cold does actually increase the natural repugnance of cream for milk, which is only in degree unlike that of oil for water, and causes mutual repulsion between the two, instead of attraction. Another writer, thinks this principle of repulsion sufficient to account for all the effects of cold upon the milk—a necessity he is driven to by his persistent adherence to the specific-heat dogma, and an unavoidable admission that cooling does cause the separation of the cream in some, to him, mysterious way.

Our writer says: "Cold setting is effective, not because it is *cold* setting, but because it is setting *at a fixed and uniform temperature*." The statement is wholly untenable. Everybody who practices cold setting knows that the best results are obtained by putting the milk into the setters just as soon and as warm as possible from the cow, and persistently cooling it *after* it is so set. Nobody ever practices setting in the manner advocated, and nobody could if he would, unless he kept his milk at the natural temperature. Cold setting is progressive cooling—nothing more, nothing less. The allusion to the common experience of every dairyman, that in cold weather he experiences difficulty in getting his cream in the common pans, does not prove anything for his view of the subject. The difficulty with the common pans in winter is that the cooling is upon all sides alike, and the milk sooner attains that happy "fixed and uniform temperature," with absence of currents, which the writer has so long and so arduously sought for, and of course, without motion or action among the particles of the milk, there can be no separation or rising of the cream. If instead of the common tin pan, which is an excellent conductor of heat, the old-style, thick, non-conducting earthen pan, warmed before straining the milk into it, were used, there would be little difficulty in getting the principal part of the cream in cold rooms in cold weather, especially if the pans were deep enough so that the cooling from the atmosphere of the room did not take place before the necessary currents were fully established.

But the winding-up sentence of this theorist caps the climax. He says: "The sole and only point to be observed is the entire abolition of currents in the milk by the preservation of an absolutely uniform temperature." That, of course, implies the abolition of cream, for until Nature's laws are suspended, no cream can be raised without both an upward and a downward current in the mass. I still believe it will be found better policy to work in harmony with Nature than to attempt to nullify or divert her efforts in our behalf.

The Herdsman.

RELATION OF WEIGHT TO PRODUCT IN DAIRY STOCK.

PROFESSOR E. W. STEWART.

Lack of Experimental Investigation Here.

DAIRYMEN are now beginning to inquire anxiously as to the most profitable dairy stock, and they seem interested in all the incidental questions relating to that subject. Among others the effect of size upon the economy of milk production is now under discussion; and each side seems to find a solution of this in accordance with its own practice or predilections. The keeper of Holsteins, Short-horns, or their grades, believes the larger cows produce the larger profit; but those who delight in the deer-like, little Jersey, and the moderate-sized Ayrshire, are tenacious in the opinion that the small cow yields the larger profit; that is, that the smaller cow yields more product for a given amount of food. The views of both sides, however, on this subject appear to be mere matters of opinion, not being based upon comparative experiments of their own.

But this question has been pretty well settled, in some of its important phases, by experiments in Europe; and it is a little surprising that there is no accurate experiment with any of the dairy breeds on record in this country, showing the relation of food to product. It is certainly discouraging that among all our agricultural colleges, many of them located in dairying States, not one has carried out an experiment to solve this question. A few days' feeding with the weight of animal, amount of food and product, noted, would be of little use. The experiment needs to be carried on for months, carefully noting the weight of the cow at the commencement and at various periods, the daily ration of food and product of milk, with chemical analyses of the milk at stated periods, and the result in butter and cheese. This, carried out for a season, with at least ten of each breed, would furnish a basis of facts upon which this question could be solved; and it is an economical problem second to no other relating to any specialty of agriculture.

European Experiments.

The relation of weight of animal to food and product of milk has received considerable attention in Germany and France.

Baron Ockel of Frankenfelde, experimented with Ayrshires and Hollanders. The average weight of the Ayrshires was 806 pounds, and of the Hollanders 1,016 pounds. The experiments proved that the Ayrshires eat 3 3-10 pounds of hay to every 100 pounds live-weight, whilst the Hollanders consumed 2 8-10 pounds. The Hollanders required 1-60th of their live-weight as food of support; while it required 1-50th for the Ayrshires. He then tested the principle on different sizes of the same breed. He took four Holland cows, the two heaviest of which weighed 2,112 pounds on June 14, and the lighter two weighed 1,537 pounds. He fed them in two lots—the heavier in one and the lighter in the other. The experiment lasted sixteen days, with the following result:

	Lucern eaten by the cows.	Milk given by cows.	Milk for 100 lbs. of Lucern.	Lucern eaten per 100 lbs. live-weight.
Heavy cows	4,921	310 qts.	7.4 qts.	14.6 lbs.
Light cows	3,859	240 "	5.5 "	16.0 "

Here heavier cows of the same breed, with the same treatment, consumed relatively less food than the lighter, and, besides, yielded a greater return of milk from it. In 1852 a series of experiments was carried on at eleven different places in Saxony, by order of the Royal Agricultural Society, through a period of five years, the cows selected being some of the best "scrubs," together with Allgaures, Oldenburgers and Hollanders, the latter two being of the same breed. The results per year were reported as follows, with common feed and common care:

The scrub cows averaged	1,437	quarts	per year.
" Allgaures "	2,334	"	"
" Oldenburgers "	2,220	"	"
" Hollanders "	2,062	"	"

With the best feed and care:

Scrub cows averaged	2,365	quarts	per year.
Allgaures "	3,060	"	"
Oldenburgers "	3,712	"	"
Hollanders "	3,232	"	"

One dairy of Hollanders, of 190 cows, averaged 4,076 quarts per cow per year. In regard to the size of cows, Caspori made eighteen experiments in feeding milch cows with a view to ascertaining how many pounds of hay, or its equivalent, it required to make 100 pounds of milk. He found that in Prussia, 100 pounds of hay given to Hollanders, made 25½ quarts of milk; and the same quantity fed to the Allgaures, made 30.98 quarts of milk. At eleven dairies in Saxony, the value of 100 pounds of hay produced in Oldenburgers 25.40 quarts of milk; in Hollanders, 26.10 quarts; in Allgaures, 30 quarts; and in scrubs, 23.65 quarts.

Villeroy's experiments resulted as follows:

Hollanders	28.93	quarts	per 100 pounds hay.
Yorkshires	27.45	"	"
Devons	19.13	"	"
Herefords	15.97	"	"
Jerseys	26.33	"	"
Allgaures	27.61	"	"

These experiments nearly all point the one way, and show that the heavier the animal the less proportional food it takes to support life and the greater the surplus to be made into milk, or into flesh in animals designed for the butcher. This also appears philosophical and what might be expected. And it is probable, to say the least, that careful experiments, carried out on a large scale, will corroborate this view. The point as to the economy of small cows for the production of butter, is not settled by these experiments. It may well be that the small Jersey cows, bred especially for yield of butter, are the most economical for that specialty; but let us not assume this till it has been thoroughly proved. In feeding for beef or mutton, there can be no doubt that the larger animals are the most profitable in localities to which they are adapted.

FOUNDATION OF A GOOD JERSEY HERD.—Mr. Charles L. Sharpless, Philadelphia, has sold to T. S. Cooper, Coopersburg, Pa., the Jersey bull Chelten Duke, price $500. This was the bull of the Centennial Prize Herd, and was out of imported Duchess, that made 13 pounds of butter per week on grass alone, and if pushed with grain, would have made a much larger yield. He was got by Pilot, jr., whose dam was imported Jenny that made at the rate of 17 pounds of butter per week. Mr. Cooper has also engaged to arrive, heifer calves out of the imported cows Milkmaid (that was bought at Mr. Gilbey's sale), Black Bess and Tiberia, three of the four cows winners of the Centennial Herd Prize; so that he will soon have the foundation upon which to build one of the best herds in the country.

The Horseman.

HORSE DELUSION.

COL. F. D. CURTIS.

GRADUALLY it begins to get into the mind of the average farmer that raising trotting horses doesn't pay—at least for him. It may pay somebody, but that somebody is not himself. 'Tis true the papers say that "Joker" has been sold for a thousand or more; but young "Dexter," now five years old, that has a very "promising gait," and has never earned a cent, for he was too valuable to work, has not been sold. "The price for such a colt is low—not a bagatelle of his true worth. Such a stepper as he is worth $500. Why people ought to snap at him at that figure." "He will go one of these days, when a man comes along who can appreciate him." "Why, I should not be surprised if he brought several thousands yet. See what Bonner pays, and this colt is a grandson of 'Hambletonian.'"

And so the delusion is kept up until young "Dexter" "eats himself up" several times, and the skeleton buggy is worn out, and then in despair and disgust the owner sells him for $125—all he is worth—and the trotter goes into the horse market and wears out before some light wagon or perhaps a street car.

Not one "promising colt" of trotting stock in twenty-five is ever worth any more than the average value for horses designed for drudges before light carts and trucks and street cars. Here they are really unfitted for the work required of them, as they are generally too light in bone and muscle, and consequently break down early. The time spent in fussing over trotting colts by the time they are five years old, and in training them, is worth all they will average in price when sold, take the country through. Such a colt must not work, as it would spoil its gait and spirit; so it does not earn anything, and grows up a dead loss and leaves the breeder in debt. The account might be made up in this way:

YOUNG DEXTER.	Dr.
To use of sire	$25 00
" keeping dam one year without work	20 00
" wintering first winter	15 00
" keeping second year, hay and oats	40 00
" do third do do	40 00
" do fourth do do	40 00
" do fifth do do	40 00
" skeleton buggy or sulky	73 00
Total	$305 00

If a colt had been raised large enough for a carriage or cart horse, or to be used on a heavy truck—which kind of horses have a fixed value and are in constant and permanent demand—at three years of age it might have been put to work and earned its keeping, and, when five years old, it would bring from $200 to $300, according to its style and size. These are the colts for farmers to raise, especially in the Eastern States. They will always bring a paying price, for they are good for farm work or any sort of service. They must be not less than sixteen hands high, with as much natural style and action as possible. It is not necessary that they should be "trotters," but they should be good easy travelers. Let the breeding of trotting horses be confined to the large breeding farms, where the business is systemized and expert trainers can handle them; and then a large proportion of the demoralization connected with fast horses, and much of the damage to farmers in trying to breed and train them, may be avoided.

The Swine-Herd.

HOG PENS AND HOG CHOLERA.

Now that summer is approaching, hogs, if confined, should be turned out to pasture. Many a farmer keeps his pigs in a little yard or pen, often near the house, where the mud is as deep as they can wallow through. He throws their feed in the mud, from which they must pick it as best they can, and clean water is something that they do not get from one year's end to another. Yet such a man will wonder why his family have the fever and his hogs the cholera! I have seen hogs kept in this way, or, worse yet, in floored pens which were never cleaned, until at killing time their bellies were full of small ulcers; and such meat is packed and shipped to the East as prime mess pork! Places where filth always reigns supreme are the fattening pens connected with distilleries. I believe that such places have as much to do with spreading disease among hogs as among cattle. So far as I have ever known, when cholera makes its first appearance in any district, it has nearly always been among the swill-fed hogs of distilleries or flocks treated as described above. I do not claim that in great cleanliness we have an infallible preventive of cholera; but I do claim that with cleanliness and proper variety of food, the appearance of the malady would be less frequent and its victims fewer; that farmers by little care and attention might save themselves much loss. Men shut a pig up in a filthy pen and give him filthy garbage to eat, and then abuse him because he is an unclean animal; but let them give him a clean place to stay in, clean food and clean water; in short, treat him as well as other stock, and see if he is not as clean as other animals. Now, farmers, try a little wholesome cleanliness with your hogs and see if they do not pay better. V. J. EMERY.

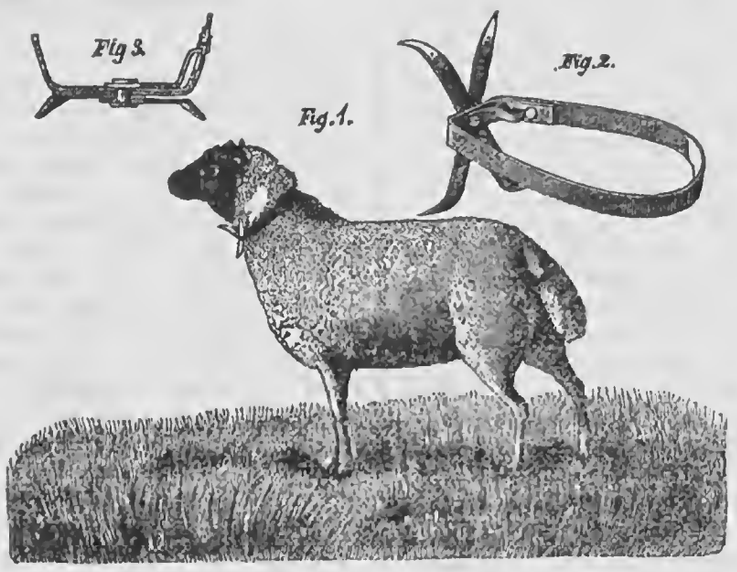
Henry Co., Ohio.

Sheep Husbandry.

PROTECTION FOR SHEEP.

Dogs are the greatest obstacle to the successful keeping of sheep. As there is no other kind of farm stock that may be made so profitable as sheep,—to say nothing of their value as furnishing a material for a useful domestic manufacture in the shape of spinning woolen yarn and knitting woolen goods, occupations which have unfortunately fallen into disuse mostly on account of the decline of sheep-keeping—it is not too much to believe, that the United States could profitably support 100 millions of these animals, if the ravages of dogs could be prevented. This is not at all impossible. It is our business to surmount difficulties. The greater intelligence of mankind is made of poor account, if it cannot find a way to overcome the sagacity or the instinct

of a brute; and it is one of the chief ends of man to overcome the difficulties that are met with in procuring subsistence and the means for comfort in spite of the injurious attacks of the lower animals, insects included, with various other pests which interfere with the success of our labors. We believe that a way may be found to overcome all these; and every hint to this effect is useful. We give herewith a method described in a German paper, by which sheep may be enabled to resist the attacks of dogs. It consists of a metal collar furnished with sharp, steel spikes, as shown at Fig. 2, and applied as shown at Fig. 1. At Fig. 3 is shown more in detail, the manner of fastening the spikes and the collar. The collar may be made of light hoop iron, and the fastenings may consist of small bolts with nuts. The spikes are held in the same way, and the collar is opened and closed by removing and replacing the bolt shown on one side. A strap of harness leather may be used in place of the iron band, and this would be more easily managed. While this may not be a thoroughly effective preventive, it will, at least, be a great protection to the sheep. Dogs will attack the animals by seizing them by the leg or hindquarters, but the throat is the most vital point; and if this is well protected the sheep will not be killed, although they may be injured.



COLLAR TO PREVENT DOGS FROM KILLING SHEEP.

The Apiarian.

HOW TO ITALIANIZE.

THE excellent qualities of the Italians as compared with the black bees, are so much in favor of the former that all amateur bee-keepers should supersede their common stock with Italians as soon as practicable. The Italians have been cultivated for many decades, perhaps centuries, in the valleys of Northern Italy, and in appearance differ from the common bees only in having the three first segments of the abdomen of a bright yellow color.

To Italianize a colony, it is by no means necessary to sell or kill off the black bees. All that is required is to remove the old queen, and in her place introduce a fertilized, pure Italian. The queen is the mother of every bee in the hive. She lays the eggs from which all workers, drones and queen-bees are developed. Hence, when a pure Italian queen becomes sovereign in a hive, her progeny will be pure Italians, and as the life of those bees that are hatched in spring, or early in summer, and have to collect the honey of the season, is but about three months, while those hatched in the fall, that go through the winter, live only about seven or eight months at the most, it will take but a comparatively short time until the old bees have disappeared from the stage and their places are filled with the children of the new queen.

If one has no pure Italians from which to raise a queen, the only alternative is to procure a young, tested queen from a reliable breeder. By a "tested queen"—a colloquial phrase among bee-keepers—is understood a queen that has been fertilized, and the purity of whose progeny has been ascertained. An investment in such a queen is a valuable acquisition to the apiary. An untested queen, though she can be bought cheap, is at best but a game of chance—a lottery—upon the fortunate turns of which no prudent bee-keeper will stake the value of his stock. Many and plausible arguments have of late been brought forward both for and against the practice of selling "dollar queens." We would advise those of our readers who may desire to purchase queens, that in the choice between quality and cheapness, they should invariably choose quality. If a breeder can furnish a tested queen, young and healthy, and warranted to be fertile, pure and prolific, for one dollar, then well and good; she is all that can be wished for; but if there is the least chance of her having imperfections that will interfere with her fruitfulness, or of having met a black drone, or that she has not been fertilized at all, she should be rejected; and rather than buy such a mother, one should pay from three to five dollars for one that is known to be perfect.

A pure queen obtained, it remains but to introduce her to the colony. On a mild day, when the bees are busy gathering honey, and most of them are absent in the fields, blow a little smoke into the hive to quiet the bees; then carefully take out and examine one frame after another till the old queen is found. Having found and destroyed her, together with all queen cells that may be under construction, the frames should be replaced. Next catch the new queen by the wing (always by the wing, as she may be seriously injured if grasped about the body), and inclose her in a small wire-gauze cage, made by bending the gauze over a finger and uniting the edges, leaving it open at one end, and close up this opening with a wooden plug or by bending the edge. When thus caged, place the cage between two frames, so that her majesty can help herself to honey from the comb. Only in very rare instances, when the bees have been a very long time without a queen, and have lost all hope of rearing one, is it advisable to introduce a valuable queen to a colony without caging her; but having been in the cage from thirty-six to forty-eight hours, the bees will have made her acquaintance, and she can then be released. Again, blow a little smoke into the hive, and if the bees should be much agitated, sprinkle them with a little peppermint water; then open the cage, daub her back with a drop of honey, and let her go out among them. If they take but little notice of her—content themselves with sipping off the honey, and then go on with their work—she is safe, and can be left without fear; but if they clinch her, and form a ball around her, she must again be put into the cage for a day or so, when the trial may be renewed. Once acknowledged ruler of the colony, she is out of danger, and in due process of time the black bees will die out and the hive be filled with active, amiable Italians.

BEES AND HONEY PLANTS.

I HAD 200 colonies of hybrid bees last autumn, and I have not lost more that six. The winter having been unusually cool, bees have not been out as much as usual and consequently losses have been less. Our bee season commences in February and continues till near December, giving us a long working season, when we take care to keep a succession of flowers for pasturage. In September we usually have the greatest drought of the season and nearly all our wild flowers are dried up. During this dry season if nothing is prepared by cultivation for pasturage, the bees get scarcely enough to subsist upon. Our lucerne meadows give great help, but generally as soon as the plants get well in blossom, the mower spoils all the prospects of honey from that source.

In all my experience with bees, I find Mignonette the most valuable for bee pasturage. This I announced through the bee journals several years ago, and continued experience has strengthened that conclusion. That plant blooms early and continues to blossom till nipped by frost. I have not a shade of doubt but that a well cultivated acre of this plant would give abundant employment for 500 colonies.

Sweet Clover comes next to Mignonette, in value for bees. There is little doubt but that this plant will yield honey faster than Mignonette, but being a perennial, it costs double what the other does that blossoms annually and is self-seeding after having once been started. There is still another very valuable plant for bees, known as the "American bee plant" that was introduced into the East in 1858. It grows in sand, is a wonderful bloomer and honey-producer, but the honey from it lacks the fine flavor of that collected from the first-named plants. I. E. JOHNSON.

St. George, Utah.

Entomological.

PARASITES ON DOMESTIC ANIMALS. No. 1.

PROFESSOR A. J. COOK.

I THINK that in all the vast realm of insect life, there are no other species so justly abhorrent and so miserably disgusting as the external parasites on man and the lower animals. Their very look is repulsive, their habits intolerable, in sooth they are fit companions of the dirt and filth which ever serve as the kindly foster-mother to these most repellant of animals. Well may the neat housewife start aghast at the sight of the nasty bed-bug, or blush with shame and confusion at the news that her own fond kin are nourishing those repulsive pigmies, the head-lice. The thrifty farmer also dreads the presence of these terrible blood-thirsty minions on his kine, for he knows that the prosperity of his animals is well-nigh impossible, if they must give of their substance to nourish these enervating parasites. But it is well to be acquainted with lice, and even with Satan himself, if acquaintance means riddance. Hence I make no apology for introducing, and even dwelling upon the habits and character of these noxious pests of the barn and poultry house.

Fleas, Family Pulicidæ, Sub-Order Diptera.

As the immature fleas live upon the organic matter of dirt and filth, these animals can only thrive as the companions of antidyness and neglect. Hence, we have more than one reason to congratulate ourselves that our State is not much troubled by these irritating pests. I have yet to see the human flea in Michigan. But, with neglect and filth, the dog, cat and hen fleas will put in an appearance even in our goodly State, and it is an unwelcome fact that these latter are nothing loth to take a sip from our own precious blood, if opportunity offers. The flea, structurally speaking, is a kind of nondescript among insects, and hence has been ranked by many able entomologists in a distinct sub-order—Aphaniptera. Others, and I think wisely, have regarded it as a degraded dipteron. The fact of its being apterous is certainly no objection to this, as all sub-orders have members that are wingless. The possession of labial palpi (Fig. 1, f), which are wanting in all other dipterous insects, would seem a stronger reason for separation, yet such differences are wanting in other groups. When we take into consideration their whole life economy, we are quite warranted, I think, in grouping them with our house flies, mosquitoes, bot-flies, etc.

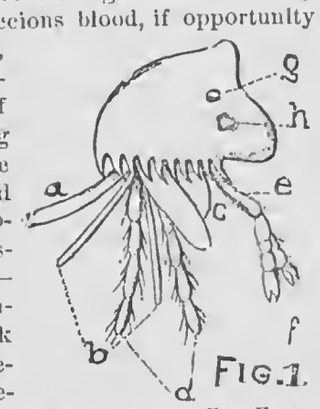


FIG. 1.—HEAD OF DOG-FLEA.

Family Pulicidæ.

The Family Pulicidæ, only includes fleas and the closely related insects, the curious jiggers, which are if possible still more degraded. These insects have only simple eyes, (Fig. 1, g) a slim labrum (Fig. 1, a) or upper lip, while the labial palpi, usually absent in dipterous insects, are always present.

Pulex Canis.

As all fleas are much the same, I will only describe the dog-fleas, Pulex Canis, (Curtis), which is our most common species. This species (Fig. 2) in common with all of the genus, is slim, and has a hard crust, hence the rapid transit of these animals, even through the densest fur, and their general exemption from hurt. The wings of all fleas are very abortive, and by the aid of the thickened thighs (Fig. 2) of their posterior legs, they ever remain as champion jumpers. Their antennæ (Fig. 1, h) are three-jointed, and concealed in pits, just behind the simple eyes. The joints of the antennæ are broad, flat and lobed. The mouth-parts are in general like the same in the mosquito, though they have the four-jointed labial palpi (Fig, 1, d) which are wanting in all other diptera. These organs form a firm but slender lance, by aid of which the insect is able to pierce the toughest skin, and through a tube formed by a union of these self-same parts, the blood is forcibly pumped up by a strong, muscular engine, their sucking stomach.

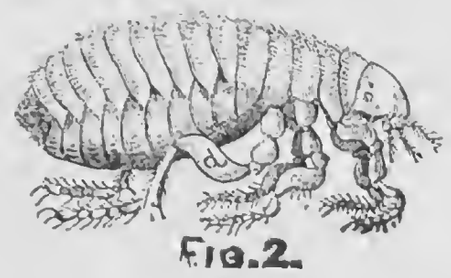

FIG. 2.—DOG-FLEA.

The dog-flea (Fig. 2) is so named as it prefers to satiate its blood-thirsty appetite from the dog. If dogs are permitted to harbor these annoying pests, the latter will gain admittance to houses, will hide in carpets, mats, etc., and anon, as occasion permits, will slake their thirst with human blood. A single flea may pierce and suck a half-dozen times in quick succession, and so agile are they that it seems to take them hardly as many seconds. "Biting as they run," they quickly inflict their painful wounds on various parts of the body. The color of the dog-flea is dark chestnut, darker than the human flea, and unlike the latter, it has sharp spines (Fig. 1) projecting from the lower lateral borders of its head, and the posterior edge of the first thoracic ring. The small, oval white eggs are laid on the animal, or in the dust of the kennel. The larvæ (Fig. 3) are footless maggots with lateral hairs, and live in dust and dirt where they feed upon the organic matter which these contain. They mature in about two weeks, when they spin slight cocoons in which the inactive pupas may soon be seen. In two weeks more the mature fleas hop forth. There are several broods in a season. They pass the winter certainly as imagos or mature fleas, and perhaps in other stages

FIG. 3.—LARVA OF FLEA.

Pulex felis, (Bouché) or the cat-flea, is very similar and perhaps identical with the dog-flea. Pulex gallinæ, (Schank) or the hen-flea, infests the poultry house and attacks the hens. Other species live on pigeons, bats, etc. All of the species will test the quality of human blood, if opportunity offers. The fact that larval fleas love and only flourish in dust and dirt, accounts for the lively appearance of the dust often noticed in poultry yards and about gardens, where the dogs, cats and poultry lie or roll. From being seen in such localities, the mature insects are sometimes called sand-fleas.

Remedies.

To thrive, aye to live, the incohate fleas must have dirt, hence cleanliness is a first-class preventive. The straw in kennels should frequently be burned and clean straw added. Frequent sprinkling of the poultry house and yard with a strong solution of carbolic acid will destroy the larvæ. I have found that a mixture of kerosene oil and lard, placed in three or four places about a dog, would immediately free it of the pests. A wash made by mixing one part of kerosene or benzine to ten parts of water, or three parts of carbolic acid to 100 of water, or a strong decoction of tobacco water, formed by steeping two pounds of tobacco in ten gallons of water, if applied to the animal and thoroughly rubbed in, will be completely efficacious, and do the animal no harm.

The Sarcopsylla penetrans, Linn., or jigger of the tropics, is a serious pest to the inhabitants of those regions. They feed, breed and live under the toe nails, where they cause distressing sores which in rare cases are so serious as to demand amputation.

[The above drawings of the insects described, are by Mr. Sherman Upton, of the Michigan Agricultural College.—EDS.]

Horticultural.

A NEW RASPBERRY DISEASE.

SOME time ago we received from an extensive nurseryman in Illinois a section of a Black Cap Raspberry cane affected by an unknown malady, which is proving very disastrous to the raspberry vines in that section. Said our correspondent: "I first noticed the white patches on the Davidson's Thornless, three or four years ago, and now there is scarcely a plant of that variety left in this vicinity. For the last two years the spots have appeared on all the Black Caps, and the only way to obtain a crop from that sort, is to destroy all the old vines and to make new plantations; for the visitation does not affect the vines until they are three years old. Many who raise the fruit here for market have never noticed the white mold on the canes, and instead of attributing the loss of their vines to it, they merely suppose they are dying out naturally." Our friend says the disease is universal throughout that State, and he asks its cause and a remedy.

From inquiries we learn that in parts of New Jersey, also, the ailment is playing havoc with the Black Caps and threatening the others. Last season the New Rochelle was seriously affected on one extensive plantation, the owner of which sent specimens of the affected cane to several eminent authorities, and asked their opinion as to the cause of the malady and a remedy therefor. To him we are indebted for the following information collected in this way:

Prof. Hazen, the entomologist connected with the Agassiz Museum, says: ". . . I have discovered in the Rubus stem nothing resembling an egg of an insect, nor anything affording proof that a larva had lived there. The beginning of the mischief is a puncture—a small hole going through the bark and per-

foratiug the wood. This puncture is round, and the epidermis is raised a trifle. Around the puncture is a dark ring, appearing, under a stronger lens, to consist of a number of cells, irregularly filled with dark, reddish-brown matter. The whole has strikingly the appearance of a bark pierced by some insect, which it sucked and left for auother spot. This could only have beeu doue by a hemipterous insect. . . . There are several small hemiptera—Cicadellina and others—that could have done it."

Dr. G. W. Harlow, of the Bussey Institute, Mass., says of it. . . . "On examining the specimens of the raspberry canes sent, I expected to find the fungus not uncommon on Raspberries; namely, Aschochyta pallor. A microscopic examination, however, although showing the mycelium of some fungus, did not give any evidence of the presence of the particular species expected. The impression derived from examining the stems, was that the trouble was uot originally produced by a fungus. . . . The specimens sent me were not in the proper state to decide the matter absolutely, but it seems probable that the trouble originated in the sting of some insect. Whether in a later stage the fungus, Aschochyta pallor, may not be developed, is still an open question. . . . The existeuce of the disease has not yet been called to my attention by Raspberry growers of this region, but it may hereafter turu up near Boston."

Prof. Chas. H. Peck, State Museum of Natural History, Albany, N. Y., writes: "I have no doubt the affection of the raspberry canes is fungoid in its character. I find fungoid filaments in the spots, and in some of them there are miuute brown or blackish dots, scarcely visible to the naked eye. These do not occur in all the spots, from which circumstauce I infer that some of the spots are sterile; that is, they do not perfect the spores of the fungus, but are, nevertheless, as injurious to the plant. The blackish dots produce spores, and from their character I should refer them to the genus Phoma—one species of which has proved injurious to Grapes, and another to garden Lobelias. . . . Until I can learn more of the disease, the only remedy I can suggest is the obvious one of cutting up aud burning all the affected canes, so as to prevent the spread of the disease. If this be done before the spores mature and are disseminated, it may have this effect.

"But there is another point on which we need light. Do the spores lodge in the canes, and germinate and penetrate their tissues? or do they fall on the ground, and, when a young shoot is first pushing its way to the light and comes in contact with them, do they then enter it and live in its tissues until it is fully developed, and then burst forth? I suspect the latter is the case with the raspberry rust, and that *it* can be overcome only by rooting up the whole plant. This cane fungus may be different, but by watching it to see if it is confined to the same tuft or cluster of canes from year to year, the question can be settled. Those fungi that live in the inner tissues of plants are difficult to deal with except by destroying the plant with the fungus; for external applications cannot reach them. In case of external growers, like mildew, the sulphur remedy is available."

The nature of the disease and the best remedy therefor will be further investigated by each of these gentlemen, and doubtless by other experts also; and we shall continue from time to time to luform our readers of any fresh discoveries in that connection.

AN EXPERT'S OPINION OF THE MONTCLAIR RASPBERRY.

The following correspondence with regard to this new Raspberry will doubtless be of interest to many of our readers:

CROTON, N. J.

DR. F. M. HEXAMER—DEAR SIR: I saw the seedling Raspberry of Messrs. Williams, of Montclair, this season, aud was favorably impressed with it. I learned from them that you had been to see it also, and I would like, as the RURAL NEW-YORKER has described and illustrated it, to have you give its readers your impression in regard to it, being a disinterested and competent authority. W. W. WARD.

New Castle, Westchester Co., N. Y.

I have seen this seedling Raspberry—now named Montclair, I think—at the nursery of Messrs. E. & J. G. Williams, Montclair, N. J. At the time of my visit the hight of the bearing season was already over; but, nevertheless, the long rows of strong, upright canes, covered with large, dark-green leaves, and literally loaded down with large berries, were a sight to behold. The main character and appearance of the plant and fruit are much like those of the Philadelphia, only more vigorous and larger, and even more productive. On closer examination, however, the berries are found to be finer-grained, more conically shaped and firmer. In color there is hardly any difference between the two varieties. In quality the Montclair is, although not equal to the foreign varieties, decidedly more sprightly and aromatic than the Philadelphia.

That the berries carry well and will stand a good deal of rough handling without spoiling, I know from personal experience. In a temperature of 101° in the shade I picked a quart basket full of ripe berries, covered it with paper and tied it up. This basket I took with me on a carriage ride of several miles, then by rail to New York, through the city in a street-car, on another railroad trip of thirty-five miles, and on another wagon ride. The basket was then kept in a warm room and not opened until two days afterwards, when the berries were found to be in good eatable condition.

Messrs. Williams' soil is a stiff clay, apparently not very favorable for the best development of Raspberries, and the plants, growing on the ridge of a slight elevation, seemed to have had no more than ordinary cultivation—rather less. They have never received winter protection, and from the fact that half-hardy kinds — Hudson River, Antwerp, Brinckle's Orange, and even Brandywine and Highland Hardy—are winter-killed on these grounds, I should consider this new variety entirely hardy.

If the "Montclair" Raspberry will succeed elsewhere as well as in its native place, the Messrs. Williams stand a fair chance of making as valuable an addition to the list of Raspberries as they have given to that of Blackberries, with the introduction of the far-famed Kittatinny. F. M. HEXAMER.

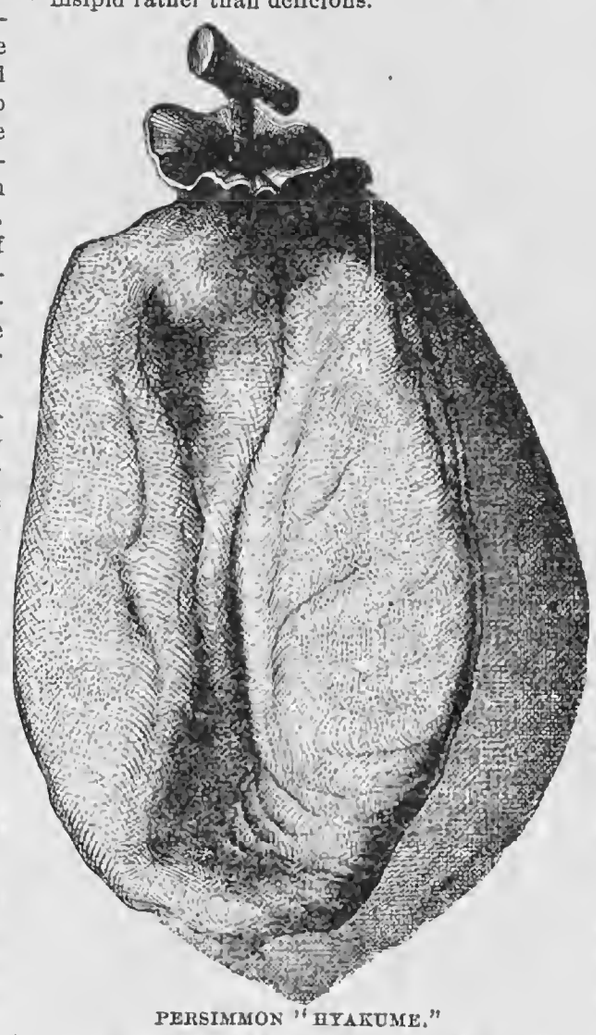
[Reference is made elsewhere to how the Montclair has stood the past winter. We are glad that Dr. Hexamer so nearly repeats our own impressions, as stated last year.—EDS.]

THE JAPAN PERSIMMON OR KAKI—(Diospyros Kaki.)

FOR two years past this plant has been advertised in this country, and is now for sale by leading nurserymen. What is it good for? A trustworthy answer may now be given, since some of the best varieties have fruited in this country.

The fruit of the largest varieties, when ripe, is about the size of the Acme tomato, though not so flattened "at the poles." In other words, it is deeper from the stem vertically through, and not so wide. The color is much like that of the tomato—in some varieties red, in others yellow.

When not fully ripe it is very "puckery," and in some varieties even the ripe fruit is astringent. In Japan this astringency is removed by packing in tubs of bran, a method of packing with the details of which we are not familiar. The flavor of the best sorts is sweet, and, from all we can learn, somewhat insipid rather than delicious.



PERSIMMON "HYAKUME."

The Kaki will not perfect its fruit in this climate; that is, in a climate similar to that of New York City. The latitude of Washington will probably prove its northern fruit limit. We have lately received from Mr. Charles Shinn, the obliging editor of the California Horticulturist, a small box of dried Japan Persimmons, of the largest of which, called "Hyakume," we have made a correct copy. These remind us, in flavor, both of the fig and the date, though they are inferior to either. In appearance one might easily mistake them for figs. The flesh, however, is tougher, and the seeds, as large as dimes, are flat and as hard as stones. Mr. Shinn writes us: "The Persimmons were from a box of dried fruit recently received from Japan. They should have been in very much the state of the ordinary Smyrna dried figs sold in all of our markets—were they so? The fresh fruit is, of course, not ripe at this season (April 3d) unless under glass. Very few trees are yet bearing in California. We send herewith one specimen of the largest dried Persimmon received—the 'Hyakume.'"

CUCUMBER CULTURE.

ALTHOUGH the cucumber is pronounced by physicians to be very unhealthy, yet it is very generally cultivated; and, in fact, no kitchen garden can be complete without it. It usually sells for a good price in market, and I, for one, am very fond of it, especially in the form of pickles, if these are put up as they should be.

My mode of culture is to dig out good-sized holes, six feet apart each way, and place about one peck of well-rotted manure in each; then fill up somewhat higher than the original surface, so that after the dirt settles, it will be about level with the surrounding ground, and plant eight or ten seeds in each hill. If very dry, I give them a sprinkling each evening after sunset, before they come up as well as through the season, for they are plants which require considerable moisture. I hoe often, and after danger from the striped bug is passed, thin to four plants in a hill.

The striped bug, Diabrotica vittata, seems to be a natural enemy of the cucumber, and against him I have tried all sorts of remedies which I have seen recommended. Boxes with thin cloth tacked over the top, are effectual preventives, but if one has many hills, devices of this sort are expensive. The last season I kept vines free from bugs by the use of ashes and kerosene. I moistened the ashes with kerosene and applied a handful to the center of each hill. It seemed to spread too strong an odor for them, and they beat a retreat. After commencing to bear, we look them over every day and gather some for pickles, saving a few of the earliest and most perfect ones for seed, and when they are ripe we pick them off and place them in the sun a few days; then the seed is taken out, washed clean, dried and put in paper bags for the next spring's planting.

CLIFTON.

Floricultural.

A WINTER'S EXPERIENCE WITH A CHEAP GREEN-HOUSE.

LAST season Mrs. Annie L. Jack gave in these pages a description of a cheap green-house she had built. Being a new venture it was impossible at the time to foretell how the little winter-garden would stand the rigor of a Canadian winter with the slight amount of fire heat she intended to give it. But now that spring sunshine furnishes quite sufficient heat, and the trouble is to keep the place cool without a fire, she gives our readers the following account of her winter's experience:

"We had built this small lean-to at the south side of the kitchen, and opened a door from there into it. A small office stove and the heat from the cooking stove have been amply sufficent to keep therein an even temperature, as all the chips and small bits of wood were used in the day-time and a fire of small coal put on about five o'clock in the afternoon in cold weather. The consequeuce has been that we have had fine, thrifty plants, and a constant succession of bloom, all winter, the Chiuese Primroses, Geraniums and others of that kind doing well in a cool bin at a distance from the fire, while our Heliotropes and Calla Lilies blossomed just above the fire, and a stand, all the length with five rows of shelves, gave extra heat and light to plants that needed them. Roses, red, yellow, and white, the rich Maréschal Niel, and the ruddy James Sprunt with many other sorts, have been a delight to us in many ways, while we have enjoyed the pleasure of giving away thirty-six bouquets during the long dreary winter.

All the girls and boys of the household own plants and have enjoyed their blooming, while at the time of birth-days among themselves or their little neighbors, they have delighted in giving away a pretty blossoming plant.

The door into the kitchen is always open except when that apartment is to be swept; *then* the door is carefully closed to exclude dust. It was a very pleasant bit of summer in which to work, or sit with a book or a friend, and if one of the children seemed to need quiet, or complained of some slight ailment, the usual prescription has been to send the ailing one to our *Italy* to sit in the sunshine that seemed to make summer all the time on that side of the house. Even little two-year-old walks about there without doing any mischief and regularly admires his own plants, and tells us which is "my flower." Such a greenhouse is a luxury many can attain, and in early spring is useful for raising cuttings, and seedlings, while lettuce, cress and radishes supply salad, that cannot then be otherwise raised. Perhaps the money it cost, might have bought us other luxuries, but that is a matter of taste, and I am satisfied with its success. Of course, one need not expect to keep stove plants in such a cool house, and some Crotons I purchased came to grief. But all the plants usually raised in window gardening, did well with us. Yellow Jessamine flowered, Begonias, too, have been full of blossom, while Sweet Alyssum, lifted in the fall, has been white all winter, and not the least of our floral treasures have been plants and cuttings sent us from the Rural Grounds."

Field Crops.

BLUNT'S WHITE PROLIFIC CORN.

WE copy the following article from the Weekly New York Sun because we desire to make a comment or so:

"BLUNT'S PROLIFIC CORN.—Quite a little breeze has of late sprung up among the seedsmen of this city over the above-named corn. It seems to have been pretty widely distributed by the Agricultural Department some two years since, and was well thought of, especially by the farmers of New Jersey, a number of whom had a good crop of it the past season. One farmer in Bergen County wrote to his favorite agricultural paper, describing this new corn, but at the same time was feeding it out to his stock, never dreaming that it was worth more than other varieties for seed. (1) But when his letter appeared in print, the editor of a rival sheet bought up the remaining stock of this corn, and sold the greater part to one of our seedsmen (2) as a new, valuable, and very scarce variety. The latter party announces:

"'We have been fortunate in securing from the originator his entire stock of the above;' and then proceeds to name the price, ranging from 75 cents per pound by mail to $10 per bushel by express. Of course, this announcement of a new variety of corn of such great value made all the other seedsmen a little uneasy, as it was evident that a brisk demand would follow so much talk about the merits of this new sort. But after a little inquiry, they discovered that there was more than one farmer in New Jersey, and probably elsewhere, who had cultivated Blunt's prolific corn, and had a limited supply on hand. A reduction of prices (3) followed among rival seedsmen, and the first drop was from $10 to $8; and then a third party offered it for $4 a bushel, at which figure it will probably remain for this season. The variety is certainly a very promising one, especially for the Middle and Northern States. The grain is very white and slightly indented, and the ears of medium size and well filled. It is claimed that on good, rich soils, each stalk will bear from four to six ears, and in some instances double this number, a hundred bushels per acre being but a moderate yield."

(1) Mr. Blunt described his corn in the RURAL NEW-YORKER of January 11, some time before the letter above referred to appeared in the "favorite journal of a farmer in Bergen Co." We, at that time, knew very little of Mr. Blunt. As his article to us made several statements respecting the yield of his corn, which we could scarcely credit, those statements were elided. Had we known him then as well as we now know him, his article would have appeared in print as it was written.

(2) We secured of Mr. Blunt his entire stock for one of our New York seedsmen, only stipulating with the latter that we should be provided (at cost) with a sufficient amount to supply the demands of our free distribution of it among our subscribers. As it is our invariable rule *never* to *sell* seeds or plants, the bill was presented to, and paid by this N. Y. seed firm. (3) As regards the reduction in price from $10 to $4 per bushel (if such is the case), we have only to say that we are confident the supply of the genuine variety in the hands of any one person is necessarily small and that we should greatly prefer to procure seed from Mr. Blunt's stock direct.

CARROT CULTURE.

THE carrot prefers a light, sandy loam of medium fertility. A good coat of manure applied to the soil the previous year, will prove of advantage; but if it is manured the same season, it should be with guano after the crop is up.

As a Garden Crop.

For garden culture the earliest crop should be sown as soon as the ground is fit to work. Late crops for winter use can be sown any time before the middle of June. The seed should be soaked a couple of days in water, and immediately afterwards mixed with a small quantity of ashes or plaster. This will prevent the seed from adhering together and it can then be sown more evenly. Sow in rows fifteen inches apart and cover the seed with about half an inch of soil. Later, the young plants should be thinned to three inches apart in the row. Cultivate diligently, and remove all weeds from the rows. The carrot crop is one of those crops that are irrevocably damaged if the weeds are allowed to get the start. The Early Horn and Atringham are among the best varieties for cooking purposes. For win-

ter use, carrots are most conveniently kept in a cellar packed, in dry sand.

As a Field Crop.

But the carrot is more extensively cultivated as a field crop for food for cattle and horses. For this purpose the Long Orange and Large White Belgian are the best. In good soil these may attain a size of twelve inches long and three inches thick, and give a yield of from 1,200 to 1,400 bushels to the acre. The land, which though light must not suffer from lack of moisture, should be thoroughly pulverized by deep plowing and repeated harrowing. Soak the seed and mix it with ashes or plaster as before, and sow it from the middle of May to the first of June, in rows two feet apart with a seed-drill, taking care that it does not clog in the hopper. Hoe the crop as soon as the rows can be seen, and when a couple of inches high, the plants should be thinned to six or seven inches apart. After this, the horse cultivator should go through the plat at least once a fortnight, as long as the crop is growing. In the fall, when the roots are taken up, they should be allowed to dry in the sun for a couple of days after the tops are cut off, before they are put up for winter use. They may be stored in a cellar, out-of-doors, or in pits, like potatoes and turnips, but having a greater tendency to decay than these, when put together in large quantities, they should be placed in small heaps only.

A crop of carrots is somewhat more expensive to raise than a crop of turnips, but for winter and spring feed both for horses and cattle, they are said to be better than any other root crop. Fed in moderate quantities, they strengthen the digestive organs of the animals and help to assimilate other food eaten in connection with them. Experienced dairymen have maintained that carrots fed to milch cows, not only increase the flow of milk, but that they impart a flavor to the milk similar to that from green pasturage, and that the butter from cows fed on the Orange varieties acquires a color like summer butter. The following analysis gives the composition of carrots:

Water	87.5
Albumen and casein	0.6
Sugar	5.4
Fat	1.2
Gum	1.0
Woody fiber	3.3
Ash	1.0

Farm Topics.

FIELD TRIALS IN FARMING.

How to Increase their Certainty, and the Value of their Results.

CONRAD WILSON.

In this discussion of Experimental Farming, I propose to illustrate the true arrangement of the factors in field trials so as to get the greatest number of results, and the largest possibilities of yield and profit. In unfolding this argument I shall be able to show not only that better results and greater certainty are attainable in field trials, than we have yet reached, but to indicate also the *method* of obtaining them.

For this purpose, let me briefly submit here a form of experiment that is exceedingly simple, and that will tend to make the final conclusion entirely clear. The plan and outline of the experiment now presented is especially adapted to show the relative value for the corn crop of the leading chemical elements, both separately and combined, and also at the same time to test most thoroughly and exhaustively the needs of the soil. It will thus be seen how many and how marvelous are the results that every tiller of the earth can extort, even from obstinate soils, by experimental processes when rightly devised.

Let us take for this illustration six or seven of the chemical elements that enter most largely into the composition of crops, and which are also found more or less wanting in the soil. These are nitrogen, potash, phosphoric acid, soda, magnesia, lime and sulphuric acid. These elements are comprised in the following ingredients which are furnished by nearly all dealers for the use of the farm; viz., sulphate of ammonia, muriate of potash, dissolved bone, sulphate of magnesia, and lime. These fertilizers, though comprising seven or eight elements of plant nutrition, make but six factors in the experiment. Yet I propose to arrange them in such a variety of combinations that they will present not less than 70 or 80 distinct factors, out of which will flow more than 100 separate results, each with a definite meaning, and more than 100 facts of experience, each of which will be new to the farmer.

Thus from six or seven factors, with their legitimate results, he may get a harvest, not only of corn and stover, but

A Harvest also of Facts, Figures and Conclusions,

out of which he will be able to build up a method for the ensuing season, and if he will take a little trouble each following year to keep the method in good working order, he can make it permanent and valuable for the rest of his life. To show the working of this plan, let the field for the trial be divided into 10 plots running north and south, each 20 feet wide and 200 feet long. Let the plot at the left side of the field remain unmanured, while on the next six, the fertilizers above named are to be applied, at the rate of 20 pounds on each, except the lime, which is five bushels.

Let us now suppose these elements to be evenly distributed, each through its own strip of land, and the corn to be uniformly planted through the whole field, which, being 200 feet each way, contains a little less than one acre. At this stage of the trial we have six-tenths of the field planted with corn, and fertilized with six different materials, while four of the strips still remain without manure. Hence there are, as yet, but seven factors, one represented by each fertilizer and one by the natural fertility of the land. If the experiment should terminate here, there would still be 13 obvious results, viz: the yield from each fertilizer, and the yield from the unmanured land, plus the increase of yield for each fertilizer. But there are still other results not quite so obvious. For example, if the natural soil gives 20 bushels per acre, the lime 50 bushels and the bone 90 bushels, we then have not only these three results, but also the increase from the lime, the increase from the bone, and the difference of yield between the lime and the bone. Thus three factors show six results, and yet the limit of increase is not reached. For if you now count in a fourth factor, say nitrogen, the results would number not merely eight but ten.

But this part of the experiment, though evidently instructive, useful, and valuable, is only a beginning. It brings us to a point where the peculiar feature of the plan may now be developed.

Across the field from west to east are now to be applied the same fertilizers as before, on strips of the same width but only in half the amount.

This Feature of the Plan

leads at once to many and valuable results, that would hardly be suspected by those who have not examined it. It not only more than doubles, but it more than squares the number of factors, and it multiplies in a still higher ratio the number of final results to be revealed at the harvest. One of the points here gained that deserves especial notice, is this: By repeating the several elements in a cross direction, and in half the amount, we not only distribute each form of plant food through different parts of the field, but also in three different quantities duly adjusted to each other, and in addition to this, we combine each one with all the others, and in more than one proportion.

For example, sulphate of ammonia will be found by itself in some of the plots at the rate of 100 pounds per acre; in other plots at the rate of 200 pounds per acre, and again also at the rate of 300 pounds. In another part of the field it is found in combination with magnesia, at the rate of 200 pounds of the former with 100 pounds of the latter, while in other plots the same two elements are combined in proportions exactly reversed; and so through the entire series.

Now the importance of applying fertilizers

In More than One Proportion

is strangely overlooked in most experiments, and yet it is so essential that no field trial is at all complete without it. It appears from the wheat experiments of Mr. Lawes, that when he varied the quantity of ammonia, while the other elements were left stationary, the difference of yield was not only surprising, but very instructive. For example, the addition of 100 pounds of ammonia increased the yield from 17 bushels per acre to twenty-one bushels; while the addition of 200 pounds gave a product of 26 bushels, and the addition of 400 pounds brought the yield up to 35 bushels. Beyond that limit the further increase from ammonia fell off at once so decidedly that the use of it was nearly a total loss.

If, now, the ammonia in these trials of the great English farmer had been used only in one quantity, who does not see that the chief value of them for practical purposes would have been immensely dwarfed? In the light, then, of this illustration, is there any room for a doubt as to the advantage of the method here presented, by which not only one factor, but every fertilizer in the experiment, is exhibited in three different quantities, and is also combined with every other in two or more proportions? This may seem, at first view, to make the trial somewhat complex or difficult, but the moment it is examined, the difficulty vanishes. In fact the easy facility of performing the experiment, as well as the economy of it when compared with the results, can hardly fail to commend it to the attention of practical men.

A brief word yet remains as to

The Cost of this Experiment,

and the amount of extra work it may be supposed to involve. On these points the farmer will be agreeably disappointed. The peculiar arrangement by which the second series of plots are made to overlap the first, in a different direction, and by which also the fertilizers are made to cross the field, not only in different directions but in different quantities, while increasing amazingly the variety of conditions, and the final number of results, does not increase the difficulty of the experiment, but, on the contrary, simplifies the work and reduces the cost.

Six different fertilizers are here applied to six different sections of land, a 20-pound bag to each, (except the lime which is measured by bushels,) and the same materials, in half the amount, are again applied on similar sections over-lapping the first series; this tells the whole story, and the cost is scarcely over $8 for the materials, even at retail prices, although some dealers offer them for this purpose, at wholesale rates.

Now, farmers, here is an experiment covering nearly an acre, and exhibiting seven or eight chemical elements under more than 100 conditions, without any preliminary trouble or delay in measuring or weighing the materials; for you will find that by this plan the various elements, in the very act of distributing them, are made to fall in the right positions and proportions in every part of the field, and that every hill of corn, wherever it stands, will have its appropriate share and quality of plant food for securing the final purpose intended.

Now suppose you should attempt to reach these same results by having this numerous series of combinations previously mixed in an endless series of bags, and should then drag them about the field to find for each its proper place; would such a process give you a paying experiment? On the other hand, by the method here offered, you have your corn growing under more than 100 various conditions of plant-food. These conditions you have an opportunity of studying all through the season, and in the fall you will be able to put the results from them on record as tests for the soil and for each separate fertilizer, and these tests will be more complete and exhaustive than any chemical analysis, and yet the whole effort and the outlay when compared with the total result, are so trifling that you are almost unconscious of them.

CONNECTICUT AGRICULTURAL EXPERIMENT STATION.

BULLETIN 24.—APRIL 25, 1879.

Fertilizer Analyses.

251. Ammoniated Superphosphate. Made and sold by the New Haven Chemical Co., New Haven, Ct., Sampled April 4, by J. J. Webb. Guarantee: Phosphoric Acid 6–7 per cent., Ammonia 3½–4½ per cent., potash 5-7 per cent., contains also Sulphuric Acid, lime, magnesia, etc.

256. Upton's Superphosphate of Lime. Made by George Upton, Boston, Mass., sold by C. B. Farley, assignee, Boston, sampled and sent April 14, by Geo. Maxwell, Rockville, Ct. Weight claimed per barrel, 230 pounds, actual weight of two barrels, 459 pounds.

252. Chicago Bone Dust. Manufactured by Thompson & Edwards, Chicago, Ill., sold by John S. Welles, Hebron, Ct. Weight claimed per bag 200 pounds, actual weight of one bag 205 pounds. Very dry and fine, 73 per cent. passing holes of 1-50 inch, but 4 per cent. coarser than 1-12 inch.

STATION ANALYSIS.

	251	256	252
Nitrogen	2.59	3.08	1.77
Phos. Acid soluble	4.57	5.49	
Phos. Acid reverted	1.70	4.58	26.03
Phos. Acid insoluble	3.77	1.13	
Estima'd val. p. ton	$36.70	$35.87	$41.45
Cost p. ton	38.00	30.00	30.00

The question is often asked, what are the other ingredients of a superphosphate besides those upon which its valuation is based?

This question is answered by the nearly complete analysis which follows:

251 AMMONIATED SUPERPHOSPHATE.

	Per cent.
Water	8.05
Organic (animal) matter	30.23
Phosphoric Acid soluble	4.57
Phosphoric Acid reverted	1.70
Phosphoric Acid insoluble	3.77
Sulphuric Acid	14.13
Chlorine	7.50
Potash	7.31
Lime	14.83
Magnesia	1.37
Soda, oxide of iron and alumina	1.28
Sand and insoluble earthy matters	5.28
	100.00
Nitrogen in organic matters	2.59
Ammonia equivalent to nitrogen	3.14

As to the state of the ingredients, the acids are united to the bases, lime, potash, magnesia, soda and oxide of iron, so far as the latter suffice, but the soluble phosphoric acid exists as an acid-salt, or, perhaps, to some extent, as free phosphoric acid. The sulphuric acid is present mainly as sulphate of lime (gypsum), the potash merely as muriate (potassium chloride). The reverted and insoluble phosphoric acids exist as phosphates of lime, magnesia and iron.

It is seen that a superphosphate like this contains all those elements of plant food which are derived by vegetation from the soil, and in that is a "complete fertilizer."

The question might be asked, do not the lime, magnesia, sulphuric acid, etc., present in this fertilizer add to its fertilizing power and influence its agricultural value? The answer must be, yes! It then may be asked—should not the substances, which are unnamed in the usual analyses, but which are admitted to have an agricultural value, be recognized in computing the commercial value?

The answer is—the three elements which serve as the basis of the valuation, viz.; nitrogen, phosphoric acid and potash, cannot be had separate from organic matters, sulphuric acid, lime, etc., and therefore the commercial value of the latter is included in that of the former. It is true that in different fertilizers, nitrogen phosphoric acid and potash are associated with different quantities, and to some extent with different kinds of other elements, but the latter are of very subordinate commercial value, and their variations do not sensibly affect the valuation of the fertilizer.

Another question often put is—why must the farmer buy so many pounds of water, organic matter, sand or even of sulphate of lime, in order to get the few pounds of valuable fertilizing matter? The answer is that the raw materials from which the manufacturer must obtain nitrogen, phosphoric acid and potash, in most cases, cannot be made to yield those valuable elements in a more concentrated state, without increased cost to the purchaser.

S. W. JOHNSON, Director.

Industrial Implements.

A NEW KNIFE GRINDER.

A NEW knife grinder for sharpening mower-sections and doing general work is shown in the annexed engraving.

Its advantages are its extreme simplicity, solidity and portability. The rest that holds the knife to be ground, is adjustable to any angle, and the emery-wheel, having a convex grinding surface, it is easy to grind up into the "jaw" of the knife-section, and, in fact, thoroughly go over the cutting-edge of the entire knife with great rapidity and thoroughness. An entire section may be ground during the pauses of mowing or harvesting. The Emery is a new patent that will not glaze on its grinding surface during the entire time of its use. A very important feature this. It is the invention of a practical farmer who perceived its necessity in his own farm work. The Wood Mfg. Co., of Worcester, Mass., are the manufacturers.

The Querist.

ANSWERS TO CORRESPONDENTS.

Queries About N. C. and Va.

E. E. R., Shioclon, Wis., asks a number of questions about N. C. and Va., as suitable places for Northern emigrants.

Ans.—The Western part of North Carolina is noted for healthfulness, and would prove, as to climate, safe and pleasant to settlers from the North. As in other States, society varies in different localities. There are places in the Piedmont section and also over the Blue Ridge, in which schools, churches, &c., offer good advantages. Honey of the best quality is produced in that part of the State. The mountain honey is proverbial for its excellence. Species of the Pine abound in different parts of the State. The question whether a Northerner would find North Carolina society congenial, depends very much upon the Northerner himself. The man who goes South with good purposes, acts prudently, and shows himself friendly, will be sure to find friends and win favor and kindness. A railroad will soon be finished that will connect Ashville with the well-known North and South lines of trade and travel, and will render that highland town a place of great resort. We advise any one, however, before he moves South, to be sure to have a thorough knowledge of the place which he selects. As worthy to be consulted for information with regard to North Carolina, we mention Maj. W. C. Kerr, State Geologist and Col. L. L. Polk, Com. of Agriculture—both of whom may be addressed at Raleigh, N. C. Much of what is here said of North Carolina as regards climate, society, etc., is also true of Virginia. There has been a pretty heavy immigration of Northern people and Europeans into the latter State since the war, and during several trips through the State a few years ago, the settlers generally spoke highly of the country and its inhabitants. Of course, the character of different parts of the country and also of the dwellers therein varies considerably, so that in speaking of the State as a whole, generalities only can be employed. For accounts of different parts of the State, we refer our correspondent to "Everywhere" *passim*. Kentucky and Maryland both offer many advantages of soil and especially of climate, to those who dislike the extreme severity of more Northern winters, but even if we were well acquainted with the circumstances of our correspondent, we should hesitate about advising him with regard to the choice of his future home, and as the case stands, we must decline doing so.

Diarrhœa in Horses, Etc.

J. W. L., Owensboro, Ky., asks 1, the cause of diarrhœa in a colt, also a preventive and remedy; 2, what will start sweet potato slips to running; 3, do we coincide with Dr. A. C. W.'s plan of pulverizing the soil only shallowly for sweet potatoes; 4, is sod land good for them.

Ans.—There are several causes for such an ailment, among which may be mentioned: indigestible and irritating food; too much water; purgative medicine; disorders of the liver; cold; over-exertion, and a natural tendency. In the present query no information is given to enable us to decide to what cause to attribute the ailment. As a preventive, avoid the above causes where possible. The nature of the most suitable remedy depends greatly, of course, upon the character of the disease and its cause, and as not a word is said on this head, no special prescription can be given. In most cases, however, a safe remedy is rice boiled until quite soft and mixed with warm water until of the consistency of a thin liquid. If not taken voluntarily it should be given as a drench. For a severe case one or two ounces of laudanum may be added to a quart of rice milk, and given every time the bowels act violently. Or instead, a thin gruel may be made with wheat meal, and the laudanum mixed with it. In all queries about the maladies of stock, care should be taken to detail at full length all the symptoms of the disease and circumstances connected with its appearance. In the absence of such necessary information, no satisfactory answer can be given in any special case. 2. A dryish sandy loam is best for the sweet potato. If planted in such a soil with enough manure, they require *heat* only to make them start. 3. That depends upon the depth of the *soil* and its richness. Our idea is to use a subsoil plow if the soil is deep, and to pulverize thoroughly by repeated plowing and harrowing. 4. Yes.

Raising Watermelons.

J. M., Lyn, Ont., wants to know how he can raise the largest crop of watermelons; at what time to plant the seed; how far apart; how to apply the manure and what varieties are the best.

Ans.—The seed should not be planted till all danger of frost is over and the ground is warmed up somewhat by the sun; say about the middle of May. Select a warm, rich, sandy loam and plant the seed in hills eight by ten feet apart. It is a mistake to put all the manure in a small heap just under the seed in the hill. Dig out the hills broad and deep, and mix the manure thoroughly with the soil. If night-soil can be obtained, this is the best fertilizer; otherwise use well decomposed horse manure or a mixture of horse and cow manures. The roots of melons do not confine themselves to the hill, but run out for several feet in the surrounding surface soil; it is therefore well to give the whole patch a dressing of manure, if it can be spared from other crops. Leave four plants in each hill, and when they have three rough leaves, water them with liquid manure, two pounds of guano to a barrel of water. The plants will fruit better if the tips of the leading shoots are pinched off occasionally. Phinney is an early variety. Black Spanish, Mountain Sweet, and Mountain Sprout are all good.

Specimen Apples.

W. H. H., Poughkeepsie, N. Y., sends us a box of beautiful apples, rarely well preserved. He desires our opinion. They are of medium size, oblong, a little conical—yellow, sometimes with a blush. Flesh crisp, sweet, though with a peculiar acidity—not juicy. We forwarded a specimen to Mr. Charles Downing who kindly replies as follows:

"The apple, although rather small for a profitable market fruit, has a fine appearance, but the quality is not good enough for a first-class eating apple, and in comparison with a Newtown Pippin, Northern Spy, Swaar, &c., it is wanting in juice and rich flavor. This is only an opinion as to this specimen which may not be a characteristic one, but if it is, I would not think it worthy of introduction now that we have so many fine kinds."

Preventing Roots from Obstructing Tile Drains.

H. B. S., Rockport, Ohio, asks how can a fruit garden, orchard or vineyard be drained with tiles in such a way that the roots will not enter the drain and prevent the flow of water. Recently he took roots of the Elder from a four-inch tile drain which had been put in at a depth of three feet and a half, three years ago. The roots, he finds, enter a very small opening at the joints and then throw out laterals that soon fill the space inside the tile and stop the flow of water.

Ans.—This question has been pretty thoroughly discussed of late by the Agricultural press and by farmers' clubs. We know of no other practicable method of preventing roots from entering tile drains, except by cementing the joints, or by using double tiles one inside the other, the joints of the inner occurring about the middle of the outer.

Bark Grafting.

C. T., Millersville, O., says that we advised bark grafting in the RURAL of the 12th of April, and asks what time of the year the bark will be loose, and, 2, if the cions should be cut in the fall, and if so, how they should be preserved through the winter.

Ans.—The bark is loose now in the spring while the buds are swelling. 2. The cions may be cut off in the fall and kept in a dry cellar during the winter with the bud ends set in moist sand; or they may be buried in dry ground out-of-doors, so deep that the frost cannot reach them. This is the best way; but they can also be cut off during the winter or spring before the buds begin to swell.

Miscellaneous.

C. T., Millersville, Sandusky Co., O. asks for a remedy for the squash and cucumber bug; 2, if it would be of any benefit to potatoes to put a handful of bran in each hill. 3. He desires a recipe for good grafting wax.

Ans.—The only successful remedy we know of for this pest is to catch and kill the bugs early in the season, before they lay their eggs. They may be caught by placing small pieces of boards, bark or chips close around the plants: they will conceal themselves under these objects during the night, and can be gathered early in the morning before they leave their hiding-places. Also examine the leaves of the young plants for the eggs, which are laid in clusters on the under side. 2. We have not tried it. It may help the growth of the potatoes, but the crop will hardly be increased enough to warrant its use as a fertilizer instead of using it as feed for stock. 3. Downing recommends a grafting wax made of three parts of beeswax, three parts of rosin and two parts of tallow. If an equal portion of tallow, or even a little more than of the others is added, the wax will be more pliable.

Mrs. C. E., North Linndale O., would like to know, 1, how long it takes palm seed to germinate and, 2, how to destroy angle-worms in pots.

Ans.—It will vary with the species and the hardness of the outer seed coat—generally from two to four weeks. 2. Angle-worms may be removed by turning out the ball of earth and picking them out, or if the soil is agitated with a long needle stuck into it, they will come to the surface and can be removed. Lime-water will also drive them out, and if applied only in moderate quantity it will act as a fertilizer as well. Slake a small piece of lime in a little water, and water the plants with it a few times.

W. M. R., Hubbardsville, N. Y., asks, 1 where can he find a list of "Next of Kin" who have claims on property in Great Britain; 2, will the corn the RURAL sends out mature in Central New York.

Ans.—We have seen such lists advertised in London (Eng.,) newspapers. They professed to be compiled from advertisements that had appeared during a number of years in papers in various parts of the country and from records of probate courts; we do not now remember, however, where they can be had, nor can we learn by inquiry here among those who are generally "posted" in such matters. 2. Yes.

D. and S., Little Rock, Ark., having tried in vain to raise currants and rhubarb, ask, 1, the probable cause of their failure; 2, how long will it take currant seedlings to bear fruit; 3, they ask the RURAL to send them a few seeds.

Ans.—We cannot help you at all. Both plants should do well with you, and both are among the easiest to cultivate. 2, Some seedlings will bear fruit in two or three years; some in not less than ten years; some not at all. The seeds are slow to germinate. 3. We could send them to you in the season.

Mrs. P. W. D., Park Place, Ark., asks what Amorpha fruticosa is, as she cannot find it in any of her guides.

Ans.—Amorpha fruticosa has been referred to several times in the RURAL. It is an ornamental shrub, of middle size, with compound leaves and violet or purple flowers in early summer.

RURAL SPECIAL REPORTS.

KANSAS, Washington, April 24 1879.—Washington County raises as much corn as the State of New Hampshire. It is well watered with excellent springs, and there is not an acre of swamp land in the county. Our lands are divided into upland prairie and bottom land on the creeks which are numerous, with good water and mills on them. The soil is a rich, black loam mixed with silica; the sub-soil on the prairie is clay, about four or five feet down, particles of magnesia and limestone permeating it, and to this it owes its reputation for the production of wheat and all the cereals. Wheat averages 20 bushels to the acre, sometimes reaching 40; oats, 90 bushels, and rye, 30. Corn is worth to-day 17c. per bushel; wheat, 75c; oats, 15c; pork, $2.40 to $3.00 per 100 pounds. We have two railroads in the county—the Central Branch and the St. Joseph and Denver R. R. Stock of all kinds do well; there is plenty of range for stock on the grass; and hay can be hired put up in the stack for $1.00 per ton. Our winters are mild, and it is a very healthy country, for invalids often get a new lease of life in breathing the pure air of these elevated plains. Sheep husbandry is quite a success. The first time a bee was seen in this county was five years since, and now I have a successful apiary. Last year from an investment of $50, I realized about $125 from the honey and increase. Golden German millet on the high prairie yielded me last year 3½ tons of hay after thrashing, and 50 bushel of seed to the acre. It is the best forage plant that has ever found its way to Kansas. Our timber on the creeks is Elm, Walnut, Cottonwood, Ash, Hickory, Oak and Locust. Apples Peaches, Grapes and small fruits are a success when the tested varieties are planted. Osage Orange is hardy here and will make a good fence in three years from planting. We have a herd law, and save the expense of fences. Any man that is willing to work and is temperate in his habits, is sure to succeed. There is work for everybody that is willing to work. The idle croaker that sits on dry-goods boxes and toasts his shins by the merchant's stove or in the smoky, whiskey-scented atmosphere of the saloon, is a failure here as everywhere. I speak this after 25 years' experience in the State. Beginning without a cent in my pocket, I am now in the midst of a community of well-to-do farmers who began their careers here in the same way. There are in this county to-day men who came here with an ox and cart, nine years since, that are now shipping their products of grain and cattle by the carload. And yet in our county to-day, there are thousands of acres of land that can be bought at from two to ten dollars per acre, and school lands at three dollars per acre, one-tenth down with interest at 10 per cent, the principal to be paid in ten years. These invite every poor man wherever he may live to come and do as we have done. We have the best of schools; we have our churches, our lyceums, our lectures and our Sabbath schools. The new-comer here should secure the advice of some reliable and honorable old settler before trusting himself to the tender mercies of the land agent in in the selection *of his future home*. Of course we have reliable agents, who are honest gentlemen, but my advice will still *hold good*.

C. W.

TENNESSEE, Humboldt, April 26.—In Notes from Chapel Hill, N. C., in the RURAL just received, the writer, speaking of fruits and vegetables in that section, says: "The strong winds of the coldest nights, and the extreme dryness that prevailed, prevented the injuries which the thermometer indicated," and also, "the frost is not likely to destroy the buds when the air is *dry*." My observation leads me to differ with him. The worst frost I ever saw, and the most destructive for fruits and vegetables, was when the air was unusually dry. This season, in April, the thermometer was 12° below freezing point with heavy showers of rain for several days previous to frost, and the ground has not been in good working order in our clay lands half the time during this month; yet our vegetables have not suffered from frost and we have some varieties of Peaches—the Beatrice, for instance,—that have a fair crop. The Alexandra has but few. The peach crop will be light generally with us, and so will pears. The apple and plum crops are a fair average. In the year 1848 we had freezing weather sufficiently severe to kill oak trees in the forest, English peas in the pods, and all kinds of fruit; yet it was an extremely dry time. There had been no rain for a month previous to the frost on the 16th day of April, nor was there sufficient moisture in the ground to bring up corn or cotton. We have come to the conclusion from our observation, that when there is plenty of moisture in the atmosphere, frost will not damage fruit as much as when the air is dry. The winds may have, and doubtless have, some effect, but on some of our large rivers and lakes, where there is plenty of moisture, fruits scarcely ever fail.

B. F. T.

IOWA, Grand Junction, Greene Co., April 22.—As specimens of tree growth on the prairie, I send the RURAL a few extracts from my memorandum book of the growth of trees on my place. The trees mentioned all sprang from seeds planted in the spring of 1875, and had attained the sizes specified at the dates given:

	—Fall of '77.— Hight.	Girth.	—Fall of '78.— Hight.	Girth.
	ft. in.	*in.*	*ft. in.*	*in.*
Green Ash	8	5¾	10 6	6½
Catalpa	8	10½	11 6	11½
Box Elder	7 to 7		11	7½
Cottonwood	9 8	7	11 2	9½
Honey Locust	3 6	2½	5	3
White Elm	8 4	5	10	5¼
White Maple	11 4	7	14 2	8

The snow-storm and freeze in May, '78, destroyed the new growth on the Catalpa and Ash; but the other varieties were not injured. In the spring of '76 the Catalpas were found to be nearly all killed at the top, from four to twelve inches. A majority of the terminal buds of Box Elder and White Maple were destroyed, causing them to throw out heavy side branches. During the winter of '76-7 all of the Honey Locusts and some of the Catalpas were girdled by rabbits. These trees were planted in drills six feet apart, and have had good cultivation. They have grown on the open prairie, with no protection. D. S. S.

NEW YORK, Corning, Steuben Co.—A neighbor has been experimenting with Early Amber Cane the past season and, he asserts, with most flattering results. He has manufactured, on a small scale, sirup of excellent quality, and intends this year to greatly extend his experiments. He is sanguine that cane sugar will, after a few years, become the chief product of the Chemung Valley. The soil seems to be especially adapted to its successful growth, and the early-ripening qualities of this particular variety, make its successful culture a certainty. There is no doubt but that this country will, in a few years, produce all her sugar, either from beets or cane, perhaps from both, for home consumption, and probably largely for export. Another neighbor has also obtained sugar of good quality from beets. Cane sugar can be produced with less expensive machinery, however, and will no doubt have the preference here, with small growers. J. L. N.

ILLINOIS, Risdon, April 21, 1879.—Weather continues cool, and farmers are busy planting corn. Wheat looks first-rate. We were beginning to need rain badly, but had plenty last week. Oats are coming up well. We shall have plenty of apples, but very few peaches. Gardens are backward, the cool weather keeping vegetation from growing. Wheat is worth 97c.; corn, 45c.; potatoes, 50c. We have a stock law in this county, and a large number of farmers have taken up their fences along the road, and are only fencing what fields they want to pasture. M. J. S.

NEW YORK, Whitney's Point, May 1st 1879.—The month of April has been cool with high winds mostly from the northwest. Highest temperature 74 deg. Lowest temperature 32

degrees; mean temperature for the month 35 deg. Number of days clear 10; number of days cloudy or mostly cloudy 6; number of days of storm, rain or snow, 4. The greatest fall of snow was on the 11th, six inches; greatest fall of rain, on the 28th, one inch. The above is for the last twenty days of April. Farmers are sowing oats. Very cold to-day wind in the northwest, and a few flakes of snow flying. Seed oats 36c; per bushel; eggs 9c. per doz; potatoes, 75c. per bushel. M. B. P.

GEORGIA, Stockton, Clinch Co., April 23.—We have a fine climate here; cattle, sheep and other stock are never housed during winter. We work out-of-doors twelve months in the year. We have pure, soft water and enjoy excellent health. In connection with sheep husbandry and stock-raising, we grow fine oats, corn, cotton, sweet and Irish potatoes. Garden truck can be sent forward from this locality to the North as early as from Jacksonville, Florida. R. S.

NORTH CAROLINA, Brookston, Warren Co., April 28.—Crops, such as are growing, have improved very much in the last two weeks. Wheat promises as about last year, not so good as two years ago. Some peach orchards will give a fair yield, while in some localities the fruit is nearly all destroyed Roses, Snowballs, etc. are in bloom. The late advance in the price of cotton, and the high rates at which our fine tobacco is selling, combine to give planters more courage and higher hopes than they have enjoyed for several years past. M. B. P.

KENTUCKY, Owensboro, April 24.—Peaches will be scarce here this season—no budded ones at all. Apples, Pears and Cherries are uninjured yet. Early Vermonts are peeping through the ground ahead of Beauty of Hebron, but of course I can't say which will be ready for the table first. J. W. S.

MICHIGAN, Schoolcraft, April 24, 1879.—The weather is very dry here. Late sowing has proved very injurious to our winter wheat. The prospects for all kinds of fruit is excellent. H. C.

PENNSYLVANIA, Bryn Mawr, April 28.—The past week of warm weather has changed the landscape wonderfully. Foliage has rapidly clothed our naked trees, and everywhere the views are lovely. M. W. F.

ILLINOIS, Dover, Bureau Co., April 25.—Spring rather cold and dry. Most of the small grains are sown, and we are now planting early potatoes. J. B.

The Poultry Yard.

DORKING FOWLS.

EVERYONE seems to have heard that Dorkings have five toes, a feature for which the poor birds have frequently incurred not a little reproach from censorious souls who looked at the extra member as an enormity, a malformation, a useless appendage, etc., and yet there are other breeds that wear the same liberal equipment of toes without exciting any special interest or "coming in" for any consequent blame. Among these may be named the Houdans, which are always furnished with as many toes as the Dorkings, and other French breeds also are often similarly equipped. So are Polands, although in their case the extra toe is not a recognized characteristic as it is in those mentioned, as well as in the Sultans, the Silkies and the Fur-fowls.

Dorkings have a few more peculiarities, which it may be well to state. Among these it can hardly be enumerated that they are "persistent sitters," as a correspondent of the RURAL has alleged; for that propensity is milder in them than in any breed of the Asiatics—and I can speak confidently on this matter, as I have kept them all. As to their laying, they will outlay birds of any Asiatic breed by long odds. As to their being tender in winter, I acknowledge they will not stand the cold as well as the Asiatics; but neither will any other single-combed breed. But with moderately good care, and comfortable quarters—things all single-combed fowls must have in winter—they will well repay the care they receive, by beginning to lay very early in spring—if not in winter—and continuing to do so during the the hotest days in summer, when Brahmas spend half the time broody on the nest, and the other half under the corn-crib waiting to see the door open, while the gray Dorking hen is busy foraging or laying.

There is little need of saying anything about the table qualities of the Dorkings, for it is conceded that for that purpose they have no equal, not only as regards flavor, but also the size of the breast, the smallness of the bones, and the juicy tenderness of the meat. As mothers, too, they are entirely unrivaled, being very docile to their keepers, and very careful with their chicks. Indeed, it is as mothers that I value them most; for in this capacity I have never found a breed to equal them—and I keep eight different breeds, most of which are raised under Dorking hens. I feel nearly equally interested in all the breeds I keep, but plain facts should be recognized with regard to each of them.

Dorkings, it is true, are not the most prolific layers, being surpassed in this respect by the Leghorns and Hamburgs; but they certainly outlay most other breeds, and retain their prolificacy several years longer than Asiatics.

HENRY HALES.

Various.

CATALOGUES, &c., RECEIVED.

EIGHTH Annual Report of the Secretary of the State Pomological Society of Michigan, 1878, Charles W. Garfield, Secretary, Grand Rapids, Mich., 526 pages. We should like to write a page in review of this book, and we would that a copy of it might be placed in the hands of every one of our readers. The Secretary seems to have had in mind, as a first consideration, the importance of rendering educational service to the reader and of making an invaluable work of reference to the horticulturist—using the word in its broadest sense—as well as to the pomologist. It is divided into two parts. Besides the usual reports, discussions and essays, nearly half of the book is made up of the "Secretary's Portfolio," consisting of a selection of articles from the current literature of the year, which in fact amounts to a choice *resumé* of the world's horticultural progress during that period.

FROST & Co., Rochester, N. Y.—No. 1. Catalogue of fruits, illustrated. No. 2. Illustrated catalogue of ornamental trees, shrubs, &c. No. 3. Descriptive catalogue of green-house and hot-house plants—bulbs, Dahlias, &c. No. 4. Wholesale catalogue of fruits, ornamental plants, &c. Also a wholesale list of green-house, bedding plants, vines, &c. The above valuable catalogues were received at this office too late for a more timely notice. They will any of them be forwarded upon the receipt of a three-cent stamp.

"A NEW TREATISE ON BUTTER MAKING," by W. B. Derrick. Published by W. P. Emmert, Freeport, Ill. A pamphlet of 30 pages treating of butter-making in general and of the Climax Churn in particular. It will be sent free to any one who applies to the publisher for a copy.

New Publications.

THE GOSPEL OF JOY!

THE GOSPEL OF JOY is a new Singing Book of unusual beauty for Gospel Meetings, Camp Meetings, Devotional Meetings and Sunday Schools.

By Rev. SAMUEL ALMAN and S. H. SPECK. It contains a large number of new and very superior Hymns and Tunes. The general style is very cheerful and bright, as befits a collection that has so much to say and sing about

"Glad Tidings of Great Joy"

Both words and music are of an elevated character, commending themselves to persons of refined taste, and the "dancing measure" so prevalent in many recent compositions has been carefully avoided.

Price 35 cts., for which specimen copies will be mailed to any address.

See Decoration Day Music in the MUSICAL RECORD, 6c.

GOOD NEWS! (35 cts.) the genial Sunday School Song Book, has thousands of friends. Do not fail to examine and try it. There are 250 Songs, in the composition or selection of which great taste and ability have been displayed. Examine also "Shining River" and "The River of Life," two standard books of great beauty.

CASH AGAINST CREDIT.—No. 2.

THE COST OF CREDIT.

CREDIT is a marketable commodity and costs the purchaser precisely what it is worth to the seller. In estimating its cost, there are several things to be taken into account besides the mere matter of interest. Interest is defined by the scientific political economist as remuneration for the use of money, which is property accumulated by labor, just as a house, or cleared land, or a ship, is property produced by labor. For the use of a house or land, rent is paid; for the use of a ship, freight is charged; and for the use of money interest is charged. This is just and inevitable. When a person obtains the use of any money or money's value, he is called upon to pay, and is morally bound to pay a reasonable sum for this use, and from time immemorial, this has been called interest. But delays in payment incur many other expenses than this. If every debtor were certain to pay his debt when due, there would be no necessity for the seller of goods or lender of money to calculate upon, or require, any other charge than the interest. But debtors fail to pay in an uncertain proportion to the number of them; but every year there are more or less of them who do not meet their engagements in time, or fail to pay at all; and actually—speaking literally and to the point—cheat their creditors, perhaps not intentionally, but none the less effectively, out of their just dues. In business this risk of loss enters into the estimates of expenses as inevitably as interest upon the use of the money, and must be provided for out of the cost price of goods made and sold.

Again: A credit business involves the use of a greatly increased capital; several times larger than would be required if cash were paid on delivery. This is evident and can be made plain to a farmer who would for a moment consider what would happen if circumstances were changed, and he were obliged to wait a whole year for the money for his pork, wheat, butter, cheese and other products. He would have to double that part of his capital which represents all this property; that is certain, or he could not pay wages, meet expenses, provide seed and fertilizers and sustain the numberless charges which fall upon his business in the course of a year. The people from whom he buys are then placed in precisely this predicament, when he buys on a year's credit. It is necessary that they should purchase and carry two years' stock of materials, and find money to pay for two years' labor, and this also involves larger buildings; the risk of depreciation in value; cost of extra insurance and other onerous charges. No business man can afford to take risks; security is the life of business, and he must provide against whatever event *might* bring a loss to him, and it is only common prudence that would estimate the charges which thus arise, in a sufficiently liberal manner to be on the right side, and so avoid uncertainty. Then, a year's credit involves the necessity for the keeping of many accounts, and for collecting many debts, and these are troublesome and expensive services done for the debtor, for which, of course, he must pay.

It is hardly necessary to pursue this point further. Any thoughtful person can see through it, and can realize to what a large extent it enters into all kinds of business. Let such a man put himself in the place of another forced to do a large credit business; to suffer constant harrassing anxieties, to be ever on the most lively watch; to keep himself informed continually on hundreds of important points; to meet hundreds of otherwise needless expenses; and he will acknowledge readily the seriousness of this consideration. What all this costs the purchaser, can hardly be told. But one can form an idea of its cost, if he will think of it in this light: Let him sell a cow to this man; a bushel of wheat to that; a load of corn to another; and so distribute his year's production among a thousand people, opening accounts for every one, watching when these come due, writing off lost accounts of defaulting debtors; and, in fact, selling just as he buys, and then figure up the result. This will be the cost of credit business from the seller's point of view; but a much worse condition of circumstances can be shown to exist from that of the buyer, and to appropriate the pertinent words of Hamlet: "Thus bad begins; but worse remains behind." The truth of this we shall endeavor to show hereafter.

KNOWLEDGE IN DAIRYING.

OUR present low prices ought to work a complete revolution in the dairyman's plan of operations. The great mass of dairymen heretofore have counted on the number of their cows, instead of the amount of their product. In fact, they have not studied the individual character of their cows—nor have they established any standard by which these shall be tried. They are judged as a herd, and no effort is made to determine the value of each cow. With butter at fifteen to twenty cents per pound, and cheese at seven to nine cents, a poor cow is the poorest kind of investment. A yield of 2,500 to 3,000 pounds of milk will pay, after deducting the expense of delivery at the factory and cost of making, only from $12.25 to $15. This will not pay the cost of keep in any part of the country. A loss of from $10 to $15 per cow would be incurred with each animal. But the dairyman has other cows that pay even in these times, from $25 to $35, and it is these better cows that prevent a disastrous failure. How utterly inexcusable in a dairyman it must be to go on, year after year, retaining his unprofitable cows to eat up all possible profits from the better ones! What would be thought of a chair manufacturer who should make a style of chairs, year after year, and sell them at 25 per cent. below the cost of production, simply because he had not taken an account of the cost of manufacture?

Yet the dairymen who have an accurate knowledge of the production of each individual cow in the herd, do not amount to more than one in a hundred. But if the dairyman would study his business thoroughly, he would fix a standard below which no cow can pay him a profit, and consequently any animal whose yield falls below this, must be discarded. With the most satisfactory prices, a cow giving less than 4,000 pounds of milk pays no profit worth having; and now, when prices are very low, the standard should be advanced to 5,000 pounds per cow. Selected herds average 6,000 to 7,000 pounds, and there is no insuperable difficulty in raising the standard for the poorest cow to 5,000 pounds.

A cow that will not, under good food and care, reach this standard, should be fattened and sent to the butcher. She has no value to the progressive dairyman as a milk-producer for cheese. For the cheese factory she is judged wholly by her weight of milk; but if the standard is to be fixed for butter, then the weight of good butter and not the weight of milk is most important. This requires a separate test of each cow for butter. And here it may frequently happen that the cow that would be discarded for cheese, would be accepted for butter-making. A yield of 200 pounds of butter per cow should be the lowest standard for a butter cow; 200 pounds of the best butter will bring as much money as 500 pounds of the best cheese. Some cows will average a production of one pound of butter to 20 pounds of milk, and thus 4,000 pounds of milk from such a cow will reach the standard.

The first test—that of weight—is so easily made that no dairyman can have a valid excuse for omitting it. A small spring scale, hung in a convenient place in the cow-stable, with a small book, containing the name of each cow, and a pencil attached, will enable the milker to weigh and record the yield of each cow, one day in a week, with no appreciable loss of time. These weighings added, and the sum divided by the whole number of weighings, will give the average yield per day with sufficient accuracy. There is no reliable way of determining the butter yield, except in churning the cream and weighing the butter.

The future successful dairyman must study and fully understand all the factors in the problem. Skill is the sign by which he must conquer. Knowledge and skill are required in the successful engineer, navigator, ship-builder, surgeon, lawyer, statesman, and these are no less needed by the successful dairyman.

ARE THERE TOO MANY FARMERS?

IT is a no more common complaint of farmers than of men in other avocations, that their business has been overdone or that, as one of them recently said to us, "Prices of farm produce will never reach paying rates again until a great many engaged in farming find work at something else." We believe that this is a serious mistake, and that it leads to other mistakes quite as serious. The idea is, that there are too many farmers because too much produce is grown. Obviously then, the world would be benefited if every farmer would produce less. A step farther, and we should all be more prosperous, if our soil were poorer. Fertility then, is found to be a curse and barrenness a blessing! About here a clear-headed thinker will see that there must be a fallacy somewhere in this logic. Let us briefly point out wherein the fallacy consists.

The trouble of this country is, not that there are too many farmers, or too many producers of any kind, but that there are too many producers who cannot sell in the markets of the world because they produce too expensively. So, we see that, after all, it is because our land is too poor rather than too rich, and produces too little rather than too much, that American farmers are suffering. We cannot have too much production of anything provided it is produced cheaply. There are not too many farmers, but too many poor farmers and too much poor farming. When we get the cost of production here down below that of other countries, we can always undersell them and there will never be any glutted market.

Despite the large areas of new lands brought under cultivation at the West, the number of men employed in farming rather decreases. Every year a larger proportion of our people live in cities and villages. It would be strange, indeed, if too many farmers were the cause of hard times, when there are undoubtedly fewer farmers in proportion to the whole population, than there were twenty or thirty years ago.

DO THE BEST YOU CAN.

WHERE is the farmer that comes up to his own ideal; who succeeds in accomplishing his own plans to his own satisfaction? There are too many incidental matters that come in to modify our fond expectations. The weather, the interruption of sickness, the reasonable claims and frequent necessities of family and friends, social obligations, accidents to tools and machinery and horses; unavoidable losses by flood or other causes, and, perhaps, many other things that cannot be anticipated, often, if not always, prevent the fulfillment of "the best laid schemes." But there is one very prominent difficulty that every farmer must encounter. He cannot get laborers that will faithfully follow his directions. Those whom he employs may strive to please him while he is looking on; and some may even do their best at all times; but many will prove careless when the directing eye is turned away; and even the truest are almost sure to bring disappointment and trouble because of their want of knowledge and skill. Perfect work cannot be done by any one who is not, himself, perfect. Unfortunately, many on whom we must rely to carry out our wishes, are destitute of the active desire and intention to improve—being content to move on in future as they have done in the past. Many seem to have no capacity for better work than that which they have long performed, and only disappoint those who strive to instruct them.

What can be done to meet this great evil? First, as you know that it will come in some form or degree, be not disheartened by it. Secondly, keep trying—make your mark high; give all practicable attention; and rest assured that, though you do not see it, the workman *is* learning, and the character of the work *will* improve. Try on! Hope on!

TEOSINTE.

LAST fall we tested Teosinte, reporting that as a forage plant it is not to be compared to corn. But in warmer climates different accounts are given. M. Durien experimented with it in the south of France, and pronounced it to be a plant *d'une vegetation prodigieuse*, as every seed produced 100 stems which reached the hight of ten feet! Still the climate was not warm enough to induce seeds. In Egypt it bears seeds abundantly. The London Gardeners' Chronicle says that "it flowered in the Water-Lily house at Kew last year, its stems attaining the hight of fifteen feet. If M. Durieu's statement is to be credited, it ought to prove of value in our Southern States. Its botanical name was first given as Reana. It is now referred to Euchlæna, and is nearly allied to corn.

BREVITIES.

THE CRESCENT SEEDLING is the most prolific variety Mr. Roe has ever seen.

ROGER'S 19 and 53, (Merrimack and Salem) says Mr. S. B. Peck, make the very best raisins—not inferior to any imported.

MR. J. J. THOMAS considers the Sharpless Strawberry "marvelous." He says "a dish of the berries would be mistaken for tomatoes."

PROFESSOR BEAL, writes us "your editorial, Cash *versus* Credit, on page 268, is all right, even to the italics. The credit system is too common and the privilege much abused."

THE FAIRS.—HORSE-RACING.—If you are opposed to horse-racing at Agricultural fairs, use your influence with your neighbors not to attend unless it be prohibited, and do not attend yourself.

WHEN there are only a few Pansies and spring bulbs in bloom, the leaves of Spiræa sorbifolia are invaluable for the green of little bouquets made of those flowers. Spiræa sorbifolia is almost the first shrub to leaf out, and the leaves are as fresh and feathery as those of ferns.

MR. ORSON GROVER of Michigan sends us an 18-rowed white Dent corn peculiarly colored. The outside of the cob is of a deep claret color—the inside white. The husk is also of a deep claret color. The combination is new to us. Mr. S. W. Howe sends us an ear of 8-rowed yellow flint, within a fraction of fourteen inches in length. The tip is covered.

IN this column last week Magnolia Halleana was printed Magnolia Halbana. We believe it is decided that the specific name should be stellata. At all events this Magnolia is hardy at the Rural Grounds, and because of its compact growth, shrubby, dwarf habit, small, glossy green leaves and abundance of white semi-double flowers, must prove a choice acquisition.

FOR corn, if no hint to the contrary has been obtained by experiment, superphosphate of lime will prove in most cases the most effective of the chemical fertilizers, and muriate of potash next. If a complete fertilizer be desired, add nitrate of soda. As a top-dressing, all or any of these, if thoroughly mixed with sand, using as much sand as time and convenience permit, may be spread more evenly and consequently more economically.

THE London Garden tells us that the true Paradise stock is that on which nearly all dwarf apple trees are now grafted and the amount of fruit that is gathered from these dwarf trees is astonishing. Cox's Orange Pippin, Stirling Castle, Hawthornden, Warner's King and Lord Suffield are mentioned as among the best varieties to work upon the Paradise stock. We are having splendid success with these dwarf trees, and what we would like to understand is why Paradise-dwarf apples are not valued for small places the same as quince-dwarf pears.

THE MONTCLAIR RASPBERRY.—In the RURAL NEW-YORKER of Oct. 12 appeared an engraving of a new variety of Raspberry, the Montclair. We are are always glad to be the first in presenting new varieties of plants which we have ourselves tested and found to be possessed of qualities valuable beyond those of older and better known varieties. We need not now repeat what was then said. But we may now say what could not then be said, that in our grounds it has stood the past winter, which seems to have been an unusually trying one to the Raspberry, without the slightest injury. It is, no doubt, a seedling of the Philadelphia, and if our report of its hardiness should be supported by reports from other sections, there can be no doubt of its superiority in all essential respects over that well-known variety.

WE asked a prominent director of one of ou "agricultural" fairs why horse-racing thereat was not abandoned? He replied: "Because it is the *life of the fair*." "Many good people seriously object to it," we remarked. "Not so many as pretend," he said. "If horse-racing is the life of the agricultural fair, why not give up the agricultural part of it?" we asked, "and make it a horse race pure and simple." "Because the agricultural part of it gives an excuse for coming, to many people that would not come otherwise," was the prompt answer.

We ask our readers to test this question during the approaching fair season. If horse-racing is to be a department of the "agricultural" fair—stay away and use your influence upon your neighbor to stay away. If the Agricultural fair has no bottom of its own—if horse-racing be the life of it—let it sink. It does not deserve to live.

"IS IT POSSIBLE that a fruit grower can establish a reputation" for the fruit he may send to market for sale; and if so, how is it to be done? is a question which Mr. Whitlesey asks and answers in the late Report of the Mich. Pomological Society. "By always putting his fruit up honestly as to quality in fair-sized packages, the fruit to be as good on the top of the package as it is in the middle or bottom. Then be sure to ship his entire crop to one responsible, honorable, and reliable commission house, and to no other; give this house the handling of all your fruit this year and next year; and so on, year after year, or so long as you may grow fruit for market, reserving however, the right to discontinue when not fairly dealt by. I feel well assured this is about the only way a reputation can be established. It cannot be done in my judgment by to-day consigning to half a dozen houses, and to-morrow to as many different ones. Send to one house for a term of years, and in this way it will begin to tell. Purchasers will soon inquire for this man's fruit, and will purchase it in preference to any other, for they will know just where to find it. My own experience after fifteen years' trial of shipping fruit, as above stated, demonstrates to me, I am on the right track." We would add this suggestion to the above: Let the packer have slips printed as follows and let him place one or more in every barrel or package of whatever sort: "This fruit was grown and packed by Jones of Jonesville. If you are pleased with it, ask for his fruit another season."

For Women.

CONDUCTED BY MISS FAITH RIPLEY

DESCRIPTION OF CUTS.

No. 6524 is designed especially for old ladies. The material used is soft gray goods, and the decorations consist of silk bands and pipings and bows. Eight and three-eighth yards of material twenty-two inches wide are required to make the garment.

Nos. 6437 and 6189 represent Princess dresses which can be used to advantage by ladies of almost any age. They are graceful, not at all trying to the figure, and by the omission or addition of trimming they can be made suitable for home use or for more dressy occasions. Price of patterns 30 cents.

No. 6487. Ladies' Trained Princess. Three materials are used in its construction, two of them being plain goods in two shades, and the third *damasse*. It comprises a basque and skirt which are permanently united. With the pattern are sent full directions for cutting, fitting and arranging, so that there is no necessity of my giving any information of that kind here. A most fashionable and elegant combination would be two shades of cameo silk and *damasse* or Radtzmier stripe. Pearl silk, sapphire velvet, pearl and sapphire Pekin stripe is another combination. A very showy toilet of maize silk, ruby velvet and maize *damasse*, and a tasteful, French-looking one of blue silk in two shades, and apple-blossom Radtzmier stripe are a few of the many elegant and showy combinations which look admirably made up in this style. To make the garment will require eleven and five-eighths of light goods, and four yards of

6487

dark, each twenty-two inches wide, together with two yards and three-eighths of the fancy goods—either *damasse* or some one of the fashionable stripes. Price of pattern 50 cents.

ST. PAUL'S ADVICE.

A Troubled Woman of Timberville Wants Light.

EDITOR "WOMAN'S KINGDOM," INTER-OCEAN—TIMBERVILLE, April 2.—You know, or will when I have told you, that Timberville has always been a very quiet town, with orderly and sedate inhabitants—that is, the majority of them. For myself, I was blessed with a Christian mother, who, I trust, taught me my womanly duties well, and early to read the Divine word. The teachings of St. Paul sunk deep into my heart. I felt, with him, that it was "better not to marry," unless I could greatly better my condition. As no such opportunity offered, the memory of my sixteenth summer had grown dim in the shadows of the past, and I was still in maiden meditation fancy free, when a "woman's rights woman" awakened quite a turmoil in our midst. Not by anything she said to us, for she was only a woman, and we paid but little heed to her words. But she aroused the opposition of Elder Jenkins, who is a powerful Scripture expounder, and he preached a long and lucid sermon from I. Corinthians xiv., 35: "And if they will learn anything, let them ask their husbands at home." I liked the sermon, but I must confess to great perplexity. I had followed St. Paul's advice in not marrying, and therefore had no husband to ask, and there were so many things I wanted to know. Concluding the next best thing would be to ask the opinion of wives who had learned of their husbands, I sallied forth. Mrs. Sam Jones was the first on my list. "Yes," she said, "that was a very fine sermon yesterday. It would be all well enough to ask our husbands if St. Paul had only directed them to answer. But so long as he didn't and they won't, we're precious well off, I can assure you." Here Paul says, "And if they will learn anything." Now, there are lots of things I want to know—for instance, how much Sam pays a year for cigars, when he says times are so hard that I must wear my old bonnet this season. I'd like to know if it is at the lodge he stays so late so many nights in the week.

The other day I went down town for a bottle of soothing sirup, for baby had fretted all night and was so cross that day I couldn't get my work done, and what should I see but Sam talking as cosy as could be with a mighty pretty girl. He was so interested he never saw me as I hurried past him, so anxious was I about my poor teething baby at home." "Now, I'd like to know who she was, but, my sakes, you ought to see how mad Sam gets when I ask him such questions." "Then, again," she ran on, "if we want to learn anything we must ask of our husbands at *home*—if we could only ask 'em in company they wouldn't dare to answer us so. It may be Paul didn't marry himself, but he knew mighty well how to please the men who were married." "And then, to add insult to injury, he must say, 'If they will learn anything,' as if it were a matter of doubt whether such stupid creatures as we would ever want to know anything." "But, Mrs. Jones," said I, as soon as I could get a word in edgewise, she was so excited. "Perhaps St. Paul meant only those things that concern our spiritual well-being." "Oh! that is what you think he means," said she; "well, you ought to hear Seth Green's wife tell how Seth comes home nights all scented up with tobacco and whisky, and when he hears the children sing their little hymns and say their baby prayers, Seth breaks in with 'We won't go home till morning, till daylight does appear,' and when she, to quiet him down, asks him about the mystery of salvation by faith, or the efficacy of prayer, he will say 'When a man comsh home tired (hic) he don't (hic) want to talk nonshens (hic).' A nice teacher of spiritual things, he is!" "And there's Melinda Smith," says she; "her husband tells her that she has five senses as well as he—brains—if she will only use them, and what sense is there in asking him about things she ought to understand better than he, he told her; her lungs were smaller than his, and probably of more delicate texture, and there would be just as much sense when she wanted a breath of fresh air for her to send him out walking and then take his breath when he came in. He says she must eat for herself, breathe for herself, and think for herself." I went home discouraged, and now dear Editor, you will see why I appeal to you. If you can give me any light on this, there are other things Paul said I want to ask you about. But now I want to know chiefly what women who have no husbands shall do, and next, how shall women who have husbands find out things?

Your inquiring sister, DORCAS ALLEN.

6189

A DENTAL HINT.

PERHAPS among RURAL readers there may be some who, like myself, cannot take medicine through a tube and it is possible the following suggestion may be of some benefit to them. Having occasion lately to take some very acid medicine and knowing by experience I could not use a tube, I applied to two or three druggists for something that would neutralize the effect of the acid. (I meant of course to take the medicine and simply rinse my mouth out with the neutralizer.) With great unanimity they recommended me to use first clear cold water and then prepared chalk. I followed their directions, using quarts of water for rinsing purposes and chewing a pound or so of chalk. The result was far from satisfactory. My teeth ached and the acid "feeling" never left them. I remembered that on one occasion a dentist had ordered me lime-water to correct acid saliva. I determined to give the lime a trial, and purchased two cents worth of it. I slacked a small portion and used it with the most beneficial results. I pour the medicine into one goblet and have the other filled with the lime water. The medicine I drink as rapidly as possible and before the last of it is fairly down I take a mouthful of the lime-water and do some very industrious work in the way of rinsing. All acids are injurious to the teeth and those who eat a great deal of fruit would do well to take a lime-water rinse quite frequently. L. M.

AN UGLY GIRL.

(Continued from page 286.)

CHAPTER X.

AFTER THE FALL.

THE torture consequent on the reducing of a bad fracture awoke Noel Estcourt from the lengthy period of his insensibility that followed his fall.

6524

At first he had no distinct recollection of what had happened, and made an effort to raise his head and look round: but it was pressed gently down on the pillows of the bed to which he had been carried, and the violent pain that followed the effort extorted from him a groan. Then he felt tears falling on his face, and heard a voice exclaim pitifully:

"Ah! he suffers so. Can nothing be done to give him ease?"

"Nothing more than we are already doing, my dear young lady," answered one of the busy surgeons, coming to the side of the speaker, and feeling the pulse of his patient. "Lord Carisforde is seriously, if not dangerously, hurt. His right leg is fractured in two places, but the injuries to his head and side are of more importance than a broken limb. Still, if his constitution is good, and neither fever nor erysipelas ensue——"

"Why speak of what may happen?" was the impatient reply. "Is not the evil of the present enough to grapple with? Cannot you suggest anything to alleviate the pains that now rack him?"

"Pray don't agitate yourself!" said Dr. Monson, kindly. "He is not conscious. As yet he does not feel the effects of his accident as acutely as you do."

"Then, I have had an accident," muttered Noel, endeavoring to collect his senses. "Yes, I recollect: the ladder broke, and I fell with it. But Miss Gray?"

"Is safe—quite safe," answered Hillian herself, with a sob. "Yes, I am here. Let me hear you say that you forgive me for being the unfortunate cause of your sufferings. If I had not gone into the tower to look for Fido—poor Fido, whom I did not save, after all—this might not have happened."

"No, no; you are quite mistaken," Noel feebly insisted. "Do not reproach yourself: no blame attaches to you. I did not know you were there. It was to find—to rescue—Miss Carisforde."

He could say no more, for a deathly faintness was creeping over him; but still he could hear, though indistinctly, the surgeons conferring together as they stood by his bed.

"We must have a regular nurse from one of the hospitals. Nonsense! my dear Miss Gray. Your

will is good, but your strength would soon fail if you undertook such a task single-handed. We should not be justified in permitting it; and Mrs. Hurst's deafness renders her of very little use; while that mother—step-mother, did you say?—of the poor, young fellow, who has done nothing but shriek ever since we came, is more likely to do him harm than good."

"And so Miss Carisforde is absent?" the other medical man observed. "That is unfortunate. However, I suppose Mrs. Hurst or you are empowered to act for her?"

"I believe," answered Hillian, promptly—"or, to speak more correctly, I am sure—that Miss Carisforde would be very angry if her absence from home induced any one to neglect her kinsman. Perhaps, Dr. Monson, you will mention this to the household, and let it be understood that as long as Lord Carlsforde is here, he is to be treated in every respect as if the place were his own."

"As it will be, if he lives, I dare say," whispered Dr. Monson to his colleague, but quite loud enough to be overheard. "He would be a very foolish youth if he rejected such an estate solely because the bride, who must be taken with it, is not the most comely of maidens. I think we may safely leave our patient in your charge, Miss Gray, while we go and take a little refreshment."

Then Noel, in the stupor with which he was wrestling, heard their steps die away, and Hillian sob uncontrollably, exclaiming, as she did so:

"What cruel, cruel things they say! Oh! miserable Ada Carisforde, had you but perished in your infancy, these things would never have been!"

He tried to address her—to entreat her not to make herself unhappy on her friend's account; but his compassion for Hillian Gray was swallowed up in the struggle to endure the pains that racked him. He was fearfully bruised, and after these few minutes of consciousness he remembered nothing more for several days, alternating between delirium and the deep yet feverish slumber of exhaustion.

The first time he awoke with cool skin, temperate pulse, and comparative freedom from pain, the sun was shining in at his open window, the church bells were ringing merrily for a village wedding, and he knew that the pleasant sounds had been mingling with his dreams for some time. He lay listening to them still, until by slow degrees his brain grew clearer, and he was able to recall all

6524

that had happened: Miss Carisforde's secret flight, the storm, the partial destruction of the tower, the rescue of Hillian Gray, and his own narrow escape from instant destruction when the block of stone fell upon the ladder.

An attempt to raise himself in bed taught him that he was not only as weak as a child, but swathed in bandages, and his head so curiously dizzy as soon as it was lifted from the pillows, that he was glad to close his eyes, and resume his former position. He was trying to lose the sense of his helplessness in sleep, when some one stirred and coughed, and pulling aside his curtain, he found that Mrs. Estcourt was dozing in a comfortable arm-chair beside him.

She started up when he spoke, and laid her hand on a bell that was at her elbow; but by a gesture, he arrested the movement.

"Don't ring. I am not in want of anything. How long have I lain here?"

"You are sure you are not light-headed?" asked his step-mother, dubiously. "Because I told them when they asked if I had any objection to take the nurse's place for an hour or two while she rested—although I must say that as Miss Gray takes turns with her, there could be no occasion for it—that my nerves would not let me remain in the room if you raved."

"I'll not rave, if I can help it," said Noel, with a smile that reassured her. "Have I been delirious?"

"Dreadfully so," responded Mrs. Estcourt. "No rest to be had night nor day; and though I have had a screen put betwixt my bed and the door, and always filled my ears with cotton-wool when you were at the worst, I could not keep out the sound of your voice. I don't suppose I shall ever recover the shock it has given me." And she cast up her eyes with the air of a martyr. "I asked Dr. Monson if the port wine he prescribed for me could not be supplemented with something more soothing. I am sure he could have sent me some sedative drops, if he had liked; but he does not strike me as being very clever; and an attentive man he is *not*, for he will scarcely stop to hear one describe one's symptoms."

6437

"How much trouble I must have given!" ejaculated Noel, who might be pardoned for thinking more of his own condition just then than his step-mother's fancied ailments.

"You have indeed!" she replied. "My anxiety has been almost intolerable. I'm not looking half as well as when we came. I can see the alteration myself. My dresses begin to fit me quite loosely."

Passing over this piece of information, the invalid continued his queries.

"Have you had any news of Miss Carisforde? Have any efforts been made to discover where she has gone?"

"Not yet. I told Mr. Whitely I dare say she would rather be brought back by you than anyone else; so he agreed with me that we had better take no steps in the matter till you were well again."

"Nonsense!" cried Noel, abruptly. "Let the guardians selected by her father be apprised of her departure; they are the proper persons to be consulted. Tell Mr. Whitely to write to them at once."

"Ah! but one of them died a few days before the late Viscount, and the other is in the West Indies; so you see there is no alternative but to wait till you are well enough to look after the young lady yourself."

Noel did not feel equal to the subject; so he lay silent while Mrs. Estcourt refreshed herself with some biscuits and a cup of jelly. But his thoughts were busy, and presently they prompted the inquiry:

"Did I not hear you say that Miss Gray has been nursing me?"

"Partly. We have had a trained nurse here as well; but I do not like her; she is too consequential. Once or twice when I have wanted a few little services rendered to myself, she has not scrupled to tell me that she was here to attend to you only, and could not undertake the charge of two patients. Miss Gray is the more obliging of the two, and she is not as attentive as she might be."

"She is very kind," said Noel, remembering her tears and piteous entreaties to the surgeons to alleviate his sufferings.

"Well, I don't know," Mrs. Estcourt retorted. "These people are paid for what they do. I've no doubt that this young person has an excellent salary, and her duties must be merely nominal. It's almost a folly for Miss Carisforde to keep her, especially as Irene might come and stay with her; for the present, at all events," a reservation her step-son did not notice at the time, although it recurred to his memory afterwards. "That would be a nice arrangement for both of them—don't you think so?"

"How much longer shall I have to be here?" asked Noel, instead of replying to such a difficult question.

"How can I tell? It will depend in a great measure, I suppose, on the doctors. Now they have pronounced you out of danger I shall ask them if they do not advise my going to the seaside. I am sure that a few weeks at Bournemouth or Hastings would do me incalculable good, especially if some one would look after those tiresome children. Irene isn't a bit of good; her last letter was so full of complaints of the trouble they gave her, that it made me quite ill to read it. Ted has set himself on fire twice, and Maggie was lost for three days, and only recovered through the police; my domestic trials will be the death of me."

Noel compressed his lips, for his temples began to throb, and he knew not how to be sufficiently grateful, when a light foot crossed the floor, and he learned from the half-whispered conversation that followed, Mrs. Estcourt was being relieved from the duties she assumed with such reluctance, and performed so badly.

"He has been talking rather more sensibly," he heard her aver; "but his mind must be still wandering, for he speaks of nothing but himself, and dropped off to sleep before I had been able to say half-a-dozen words to him."

With which somewhat exaggerated assertion she complacently sailed away.

CHAPTER XI.

FIRST HOURS OF CONVALESCENCE.

Noel was not only fatigued by his chat with Mrs. Estcourt, but depressed as well. The mere sound of her voice—that fretful voice which had so often irritated him beyond endurance—brought back all the harassing duties which devolved upon him, as the main support of his step-mother and her young family. He never felt her intolerable selfishness more keenly than he was now doing, for he had never before been so weak and excitable, so utterly unable to shake off the nervous irritation she contrived to produce; and he lay thinking over her revelations concerning the incapable Irene, and the turbulent little flock she was left to manage as best she could, till his vexation vented itself in a heavy sigh.

"You are suffering," was murmured in low, compassionate accents. "May I bathe your temples, or arrange your pillows more comfortably?"

It was Hillian Gray who spoke, and his heavy eyes unclosed to gaze upon the kindly face of his young nurse.

"I have heard from Mrs. Estcourt how good you have been to me," he murmured; "some other time, if I live, I must thank you for it; just now—"

He had not strength to say more; but his looks were so eloquent, that she colored with mingled pleasure and pain.

"Did you not save my life?" she answered; "and though there are few, very few, to whom it is precious, I am more grateful to you than I can express. But you are feverish; something has distressed you. May I ask what it is?"

"I should like to see Mr. Whitely," said Noel, speaking with extreme difficulty, for he was too weak to bear more. "I must make my will, and secure to my step-mother and her children the little I have to leave."

"Cannot you trust their future to Miss Carisforde?" asked Hillian, hesitatingly. "They are her relatives as well as yours, and believe me, she is neither selfish nor ungenerous."

But, as he persisted in his request, she promised that it should be attended to; and, soothed by this assurance, he slept again till evening.

But he did not awaken as refreshed by his slumbers as those who watched over him had been anticipating; and the doctors in attendance questioned Mrs. Estcourt, and lectured her so sharply for permitting him to talk and be excited, that, in high dudgeon, she absented herself from his chamber for the next two or three days.

It was fortunate that she did so, as it gave Noel time to gain strength for the next infliction. Those days were such calm, soothing ones that he often looked back to them with regret long after his

6437

health returned. Too weak to raise himself without help, he lay hour after hour—seldom suffering much pain, but unequal to the slightest exertion—sometimes dozing, sometimes dreamily watching Hillian Gray, as she moved with light foot about his chamber—careful that it should always be fresh and gay with flowers. The nurse was stolid and silent; while Mrs. Hurst, who was eager to be of service, was only admitted to the sick chamber on condition that she did not open her lips as long as she was in it, an arrangement for which she compensated to herself by so many nods and smiles, and pantomimic gestures, that Noel was amused.

Under these circumstances, the carefully-modulated tones of Hillian Gray were the sounds that most frequently met his ear; and to one who for years had had his leisure broken in upon by the din of a large, unruly family, and the maundering complainings of their mother, such an interval of calm was unutterably delightful.

He could not refrain from making a grimace when Mrs. Estcourt, having learned that he was considerably better, announced her intention of paying him a visit. But when he heard Hillian whisper the query to Mrs. Brown; would it be prudent to admit a visitor whose presence had such an unfavorable effect on their patient? he swallowed his reluctance, and answered the question himself.

"Pray, let Mrs. Estcourt come, if she will. She was my father's wife, and I must not fail in courtesy towards her; but at the same time," he added, faintly smiling, "if you can hint to her that I haven't my nerves under control yet, and can neither talk nor listen long, I shall be grateful."

Warned, therefore, that she would not be permitted to remain for more than a quarter of an hour, Mrs. Estcourt came to the bedside of her step-son, and contrived in the first five minutes to raise his blood to fever heat, and bring back the acute pains in his head, which were amongst his worst symptoms.

"Really, Noel, you look worse instead of better than when I last saw you! I don't believe that you are properly attended to; and if it wasn't for my own health being in such a weak state, I would insist upon taking charge of you myself. It's just as I predicted. The young woman Gray knows nothing about nursing the sick; and it's my private opinion that Mrs. Brown drinks."

"I am feeling considerably easier," Noel told her.

"Ah! but that's not always a good sign," was the cheering reply. "I'm often worse myself after my spirits have been unusually good; and Dr. Monson says that your leg was so badly shattered, that it will be weeks and weeks before you are able to stand on it. I should not be at all surprised if he has to amputate it, after all."

Noel shuddered, and put up his hand to beg her to forbear.

"Pray don't discuss my condition; I am not strong enough yet to contemplate the loss of a limb with composure. Have you heard from Irene lately?"

Mrs. Estcourt's reply was a startling one.

"Don't speak of her! Heartless, unnatural girl! Knowing, too, how I am situated! With you lying here helpless, the entire charge of a great house like this resting upon me—for, as I told that impertinent Mrs. Martin yesterday, as long as poor dear Miss Carisforde is away from home, I shall consider it my bounden duty to look after things for her——"

"Never mind that just now," said Noel, wincing at the idea of his step-mother's uncalled-for interference in the affairs of a stranger; "but do tell me about Irene. What has she been doing?"

Mrs. Estcourt applied her handkerchief to her eyes.

"Doing! Her best to lay me on a sick bed! My anxieties are really too much for me! I'm sure your rashness, which was really inexcusable, as there are all those poor children looking to you—"

"Irene!" groaned Noel, impatiently. "Tell me of her! We ought to have foreseen that she was too young, too inexperienced to be left alone. Why keep me in suspense? What has she done?"

"Why, nothing as yet. How absurd it is of you to agitate me so! If you only would have had patience to listen to me, I should never have told you the substance of her letter; or you can read it yourself, if you like. I have it here—at least, I think so."

After making a long search in her pockets, and nearly driving Noel wild by hunting about various parts of the room—which, by-the-by, she had never approached—Mrs. Estcourt decided that the missing epistle must be on the mantel-piece in her own apartment, whither, at her step-son's urgent entreaty, she went to seek it. When found, it proved to contain a mutinous protest that Irene would not endure the annoyances of her position any longer.

"I'm sure I've done my best," she went on to say; "but with no money—for what you left wasn't half enough—and no servant—for Ann has heard of a better place and left us—and the children hungry as well as tiresome, I'm as mad as the March hare and the hatter together. I would not have put up with it as long as I have done only for Noel. How is he? You said so much in your letter about your own fright, that you did not leave yourself room for more than about two lines about him, and those were so blotted that we can't make out whether he has broken his neck or his leg. And so, mamma, this is to let you know that I can't and won't be left here any longer, and have quite—*quite—quite* made up my mind to run away. I have packed a bag to carry with me, and I shall take out of your dressing-case the bracelet you are always promising to give me whenever you want me to do anything for you very particular; and I mean to sell it and live on the proceeds as long as they last; so if you are not at home within twenty-four hours you'll find the children locked up in the kitchen—it's the safest place I can think of—and the key at the baker's; and this is the firm resolve of your affectionate but exasperated daughter,

I. E."

"P. S.—If Noel is very ill, don't tell him till you are obliged: it will worry him; but I have stayed as long as I could.

"P. S. S.—It is your own fault, mamma. It is three days since I wrote, telling you how I was situated, and begging for an immediate reply. Some one else might have written if you couldn't. If you knew how miserable——"

A great tear had effaced the rest, and Noel breathed a compassionate "Poor child!" as he saw it.—To be continued.

EQUAL TO THE EMERGENCY.—A young lady was sitting with a gallant captain in a charmingly decorated recess. On her knee was a diminutive niece, placed there *pour les convenances*. In the adjoining room, with the door open, were the rest of the company. Says the little niece, in a jealous and audible voice, "Auntie, kiss me, too." I leave you to imagine what had just happened. "You should say twice, Ethel dear; two is not grammar," was the immediate rejoinder. Clever girl, that.—[*London World.*

THE COTTAGE GATE.

BY ETHEL TANE.

In the sultry time of mowing,
When the fields are full of hay,
Pretty Janet brings her sewing
To the gate, at the close of day.

Do you wonder that she lingers—
Often glances down the lane?
Do you ask me why her fingers
Seem to find their work a strain?

Love-dreams hold her in their tether;
Love is often (as we know)
Idle in the summer weather,
Idlest in the sunset glow.

Now the toil of day is over:
Janet has not long to wait
For a shadow on the clover,
And a footstep at the gate.

How is this?—The slighted sheeting
Has been taken up anew;
Very quiet is her greeting,
Scarcely raised those eyes of blue.

Now he leans upon the railing,
Tells her all about the bay;
Still his pains seem unavailing—
Very little will she say.

If you think it strange, my reader,
Learn a lesson from the rose,
She, from the garden's queenly leader,
Fairest flower that ever blows.

Not at once she flaunts her petals;
First a bud of sober green;
By-and-by the stretching sepals
Show a dash of red between.

Breezes rock her; sunbeams woo her;
Wide and wider does she start;
Opens all her crimson treasure,
Yields the fragrance at her heart.

Ah! the rose buds will not render
All their secrets in one day;
And the maiden, shy and tender,
Is as diffident as they.

SOME FEATURES OF NEW YORK LIFE.

NEW YORK RESTAURANTS.

A New Departure—Its History.

NEW-YORK has lived without cooks for a longer time, probably, than any place with pretensions on this planet. In private families and boarding-houses steak has been given over to ignorance, and boiled potatoes, as they should be boiled, are as unknown as the whereabouts of the "Lost Tribes." Among the many doubtful favors bestowed on this land of freedom by the Emerald Isle is included the female cook. God has given us the food—and delicious it is—but Ireland, alas! has sent the cooks. The miseries of the New-York boarding-house deserve a chapter all to themselves, every word printed in capitals, but I prefer, like the Celestials, to commence with the dessert, by speaking of the pleasant reform that is now operating in favor of a better *cuisine*.

The new, cheap restaurants may be said to have a mushroom growth, so quickly have they appeared and multiplied on the face of the earth. We have always had our Delmonico, and latterly an active rival, the Brunswick, while several hotels have acquired more than local fame because of excellent cooking. These may be called the library editions, lavishly bound, only to be enjoyed by those whom fate has equipped with a pair of shears and a barrel of four-per-cents; the cheaper paper cover editions, so to speak, are of very recent date, but it is now a very pleasant fact that one may enjoy a good dinner at several restaurants on the payment of one dollar; more moderate gastronomic aspirations find satisfaction, even, for only sixty cents! It is as curious as pleasant to trace the rise and progress of such an admirable order of things.

Queer to relate, the man who first attracted considerable attention as a *restaurateur* with low prices, was an Irishman named Donovan. An illustration of the laws of compensations. He converted a private house in West Twelfth Street into a bower where an excellent *table d' hote* including wine was provived, for $1.50 per head. This was the first gun for freedom and a good dinner. Numberless young men deserted boarding-house tables, established themselves in furnished lodgings, and realized that for a long time they had lived without dining.

Presently an Italian, Morello, established himself in the Fourth avenue, directly under a photographer, and it was not long before it became generally known that one could worship at this shrine of Epicurus on the payment of only eighty-five cents. What gay memories entwine themselves about those stuffy little parlors. There, any evening, one saw clustered around the little tables cozy parties of four or less, intent upon eating a good dinner, well served. The waiters were polite, attentive, noiseless; could take orders in a half-dozen tongues without letting their linguistic accomplishments betray them into the impropriety of taking a too active interest in the sprightly talk of the guests. All climes, all classes, all degrees met there to dine. The well-regulated German brought the entire family and a friend, and the tongue of the fatherland became almost agreeable to listen to under the emollient effect of crisp salad, dressed with Lucca oil. The journalist who had made a "strike," and the artist who had been fortunate in disposing of a "pot boiler," paid tribute to Morello, who was the living expression of a beatitude as he sat behind his little desk. He seemed to know that his mission was to do good, and looked as if he was convinced that he had hit upon the right means, and was receiving his reward in advance of the hereafter.

A countryman of Morello, Martinelli, urged on by the spirit of competition, presently displayed his banner on the outer wall further up the same avenue, and instead of inscribing on it "still higher," announced that *seventy-five* cents was the price of his *table d'hote*. Here, then, was an embarrassment of riches. A good dinner and poor wine for three-quarters of a dollar! Trade was immense. Martinelli confined himself more strictly to Italian methods of cooking; hence attracted the larger number of his countrymen. It was funny to see Americans trying to eat macaroni after the most approved Italian manner. To the native it was a simple matter to transfer this toothsome dish from plate to mouth. It was simply a continuous stream of macaroni. Like those optical toys designed to show the phenomena of light, when the slatted disc is violently set spinning, the separate colors blend into a white streak, so with the elusive vegetable—it was merely a white streak extending from mouth to plate, the fork playing a running accompaniment. The Yankee, on the other hand, had to submit to awkward breaks in the process, that left the macaroni suspended from his mouth in very ungraceful strings, while he struggled to put out of sight a dangling and palpitating mass. But it was very good, once down. Martinelli has made money, moved up town, opened a larger and more pretentious establishment, and by adding a few nuts and raisins to the *menu*, has had the audacity to increase his tariff to one dollar. I don't pray for his success, especially as the latest addition to this brotherhood of benefactors has opened a charming place and gives an admirable dinner for *sixty cents!* How can worth and cheapness any further go?

The Hotel Hungaria was originally started as an enterprise of a wine merchant who took this means of popularizing Hungarian wines. Here there was capital with which to build, and as a consequence, it is a spot where a good dinner is served amid inviting surroundings. Flanking the tables are candelabra of the most ornate kind interspersed with vases and hanging baskets filled with growing plants. A miniature fountain plashes musically, and the slippered waiters glide about noiselessly, like the ministering angels that they are, while the guest leisurely looks over the papers, daily, illustrated and foreign, before his soup is served. The wine here is extra. But what does one get for sixty cents? I append the *menu* for one day, with the remark that the viands are good, excellently cooked, and bountiful: Soup—Julienne; Fish—Cod, oyster-sauce; Roast—Beef; Vegetables—Potatoes, string beans; Game—Roast duck; salad; Dessert—Blanc-mange, wine sauce; Cheese—Neufchatel; Coffee.

After having discussed this satisfying meal, and lighted one's cigar, there is just about time to consume it before the play commences at some one of the theatres in the vicinity, or if the diner is not in the humor for histrionics, he may saunter up Broadway reflecting the while on the satisfaction he has secured for so small an outlay, and being in too happy a frame of mind to harbor resentment, he thinks of his old boarding-house days in a spirit of mild contempt, while apropos of the restaurateurs the ever recurring conundrum is: How can they afford to give so good a dinner for so little money? But they need never answer the question if only they will continue to demonstrate the fact. RACONTEUR.

SHE SAW "PINAFORE."

(Letter from Doll Boffin to Her Cousin Primrose.

BOSTON, May 4th, 1879.

MY DEAREST PRIM.:—Why don't you write oftener? It has been an age since I received a single line from you. Let me see. Your last letter was dated April 30th. You know you promised to write awfully often. But that was not what I was about to say. My dear, I have seen "Pinafore!" To be sure, I have seen it about twenty times in New York, but this is quite another thing. It is the "Ideal" Pinafore, if you please. Lucy and I were out shopping. You remember Lucy—such a *dear*, good girl, but wears such positively frightful hats! She says it doesn't signify about what is on the top of one's head, so long as one has something *inside*. You should *hear* her talk French. Real New England French. Well, no matter. As I said we were shopping and I saw posted all over the city, in great, big letters, "H. M. S. Pinafore—the 'Ideal'—our Boston favorites; for a limited season!" I said to Lucy that I must see *that* or *die*. And then she told me all about them. There were Myron Whitney and Barnabee, Tom Karl and Miss Beebe, and oh, a whole battery of the most *tremendous* church canons. Really quite *swell*, you know, for Boston; and that it was just perfectly splendid. She didn't say it in just those words—Lucy abhors slang. She said it "was an uncommon combination of Boston's best musical 'culchar,' for the purpose of rendering in an idyllic manner the most truly clever serio-satirical-comic work that has of late been offered to refined and appreciative Boston audiences." That decided it, my dear, I should have seen *that* "Pinafore" if I had had to go in last winter's bonnet! And we went, Lucy and I. It's too funny to see the girls going alone to the theatre. You know the men are so scarce—at any rate, so Lucy says—that it is awfully hard to get an escort, so they just go in couples by themselves. We went to the box-office and purchased our tickets just like little men. Think of it! a reserved seat for seventy-five cents. As we entered the lobby I saw any number of young fellows, and I thought Lucy must be mistaken about there not being enough of the article to go round. I think it's because there are not a *quantum suf.* of pretty girls to make it an object. There! don't you breathe a word of this. Not even to Flora Jones. It's *very* confidential.

I thought the curtain never would go up, but I did not mind that so much, as I was talking away, as usual, at least thirteen to the dozen. I noticed that Lucy was very quiet, but I was so well pleased at listening to my own gabble that I thought nothing about it until I suddenly turned to ask a question. Well, you will *never* believe it, but, my dear—*she was chewing gum!* You could have wafted me away with a zephyr (is that *right*. It's so much easier to say these words than to spell them—and I would'nt ask Lucy *for worlds!*)

Well, the curtain did go up finally and there was the "Ideal" crew of the "Pinafore" all "Boston Favorites." They hitched up their trousers in real nautical style and began the opening chorus. Then "Little Buttercup" appeared. She *looked* the character better than any Buttercup I have seen. That woman was five and thirty *if she was a day!* Then she carried an "ideal" basket, just such an one as you would expect a "Boston Favorite" to have, real American make with patent tin fastenings on the corners; instead of getting something that looked as if it might have been made in England. She sang pretty well, but her feet were too large—much too large. Then Mr. Tom Karl—"Rackstraw"—appeared. It was too amusing. He thought he had the real sailor roll. But that was all right. The only sea he ever saw was a Bishop's See, probably. He sang very well, also. Oh! you dear old Prim., if you had only been along what fun we should have had! "Josephine" was killing. She's as *pretty*, as pretty as—well, as a Bostonian, an "ideal" Bostonian, and a "Favorite" into the bargain. Her idea of expressing emotion is to clap her hands to her ears and sway up to the foot-lights with a motion that commences at her feet and goes up as if there were four concealed hinges worked by springs somewhere about her dress. "Rackstraw" had the same gait, and when they did the emotional together they bobbed about like travelers riding on camels. And "Sir Joseph Porter,"—well he was the sickest Sir J. P. I *ever* saw, a regular *stick*, and he thought he was too "ideal" for anything. I know he did.

Up to this point I had behaved very well, but when the "sisters, cousins and aunts" appeared, I *exploded*. It was a sight for gods! "Hebe" was a *perfect* fright. Her form—well, I'll tell you about that when I reach home. It was "ideal." You never saw anything like it unless it was in some collection of antiquities. The other relatives afforded me food for amusement during the remainder of the opera. I can't tell you about them, I shall have to act it out for your special delectation.

Poor Lucy! She thought it was all *very* fine, and spoke in the *highest* terms of the "Favorites."

Primmie, you may just thank your *stars*, that you live in New York and are invited to see a *real* good play occasionally. By the way, did Charlie Macguffin call this week? I met his cousin here. He wears eye-glasses and says "cawnt" for can't. Did you get my gloves? I received the lace *nicely*, that you sent folded in the *Home Journal*. Grandpa says its wrong to cheat the mails, and I said we always fooled the males when we could, and Lucy said puns were not intellectual. I am afraid you won't consider this letter *very* intellectual, considering I've been in Boston a *whole* week, but then I'm not a "Favorite," you know.

Write soon, there's a dear, and believe me your *awfully* affectionate DOLLY.

P. S. Did Frank say anything about me Sunday Why don't he write? Yours till death.

D. B.

HOW TO MAKE COLOGNE WATER.—With no trouble at all, any one can make in her own storeroom a better article of cologne than that which is usually bought, by thoroughly dissolving a fluid drachm of the oils of bergamot, orange and rosemary, each with a half a drachm of neroli and a pint of rectified spirits. As good as can be made out of cologne itself, however, is also prepared by mixing with one pint of rectified spirits two fluid drachms each of the oils of bergamot and lemon, one of the oil of orange, and half as much of that of rosemary, together with three-quarters of a drachm of neroli and four drops each of the essence of ambergris and musk.

If this is subsequently distilled, it makes what may be called a perfect cologne, but it becomes exceedingly fine by being kept tightly stopped for two or three months to ripen and mellow before use.—*Chemist.*

Hooper; Our Monthly Gossip—On Proposals of Marriage—A Literary Nestor—Two Naughty Little Boys—Shelley and Lesser Vegetarians—Some Oriental Superstitions—What the English Schoolboy Learns about American Geography; Literature of the Day—Hamerton's Life of J. M. W. Turner—Lady Anne Blunt's Bedouin Tribes of the Euphrates—Perry's History of the Church of England—Ballard and Thayer's American Plant-Book.

WHAT THE ENGLISH SCHOOLBOY LEARNS ABOUT AMERICAN GEOGRAPHY.—A few items of United States geography, gleaned from a standard English school-book, may, we think, prove fresh to our readers. This book, which was recently put into the hands of an American boy at an English school, is entitled Elements of Geography, and is from the learned pen of Dr. Alexander Mackay, who writes the letters LL.D. and F.R.G.S. after his name. It is a small, closely-printed volume, between whose modest covers an astonishing amount of information is accumulated, its scope embracing the whole science of geography, physical, political and mathematical. It is no new and untried production, but bears proudly on its title-page the record of its thirty-seventh thousand, while an abridgment, entitled Outlines of Geography, is already in its hundred and sixth thousand. A brief preface informs us that the greatest care has been taken to put the Elements fairly abreast of the new and improved edition of the author's Manual of Geography, which we presume is equivalent to a promise of its being abreast of the times. Evidences of this care are not wanting. Our own civil war and the Franco-Prussian war both receive due mention, with the difference that the final results of the latter are recorded, while the former, we are left to infer, is only at the commencement of its end. A brief but thrilling summary of its events leaves it with the curtain just about to descend: "After a lengthened contest of the most sanguinary character the fleets and armies of the North *have* at length triumphed—Richmond *has been* evacuated, most of the Confederate generals *have* surrendered, and President Davis *has been* captured." This past tense of yesterday has the vividness of an historical present. We advance a little beyond Richmond, however, on another page, where we find this latest bulletin: "Many slaves were set free during the late civil war, while by a *recent* proclamation of President Lincoln liberty has been extended to the entire remainder."

Turning from history to geography proper, we find that Albany, which we had regarded as a quoit-stake for New York "rings," is "a large, thriving city, most advantageously situated both for foreign commerce and inland trade;" also that "its university is the principal educational establishment of the United States." Harvard takes a more modest place as the "oldest and best-endowed *seminary* in the Union," though, as a partial consolation, its library is stated to be the largest in America. Providence is likewise noted as a literary and educational center, while Pittsburg in its mountain-retreat is credited, in addition to its iron industry, with an extensive activity in shipbuilding. Washington enjoys two claims to distinction: first, as the capital of the District of Columbia; secondly, as the metropolis of the United States. Detroit is still more remarkably characterized. In addition to a shipbuilding fame which it shares with Pittsburg, it is distinguished as "the landing-place of hosts of emigrants from Europe."

Thus are our cities arbitrarily exalted or made low, till we begin to suspect that some artful Yankee, with his own ends either of business or pleasure in view, has submitted the worthy doctor to the process known in slang phrase as *stuffing*. Not less bewildering is his mode of "locating" some American towns. It is a pretty broad statement to mention Toronto, Hamilton, Cleveland, Detroit and Chicago as towns on the St. Lawrence, but when we find Portland on Massachusetts Bay, and that saline body of water classed among the rivers, we scent a new "element" in the book, and doubt if Dr. Mackay's forte does not lie rather in the direction of *mental* than of *physical* geography. In a somewhat curious division of States the District of Columbia is placed among the North-Eastern States, while Delaware and Maryland are not discoverable till later in a list of those of the South-East. A description of our coal-fields ignores the Pennsylvania bed of anthracite coal, though it is tacitly included in the general area of the coal-regions. We have little to complain of, however, as regards omissions where there is so much that is novel and instructive, especially as the space accorded to the American matters is much more generous than that grudgingly allotted in our own school geographies to the celebration of any European country. Whether Dr. Mackay is more careful in his statements regarding those neighbors who are nearer home we have not looked far enough to say. We are content to leave the rights of others to their own guardianship. Ignorance is a lame excuse for a Fellow of the Royal Geographical Society, though we once cheerfully forgave on that ground a Paris *sergent de police*, who, on being informed that we came from Philadelphia, surveyed with wonder our Saxon features and naively remarked, "Mais vous n'etes pas noir, vous!"—*Lippincott's Magazine.*

ECLECTIC MAGAZINE.—The May number of the *Eclectic* is embellished with an excellent steel-engraved portrait of M. Grevy, the newly-elected President of the French Republic. This is accompanied in the letter-press with a detailed and interesting sketch of his career, and of his character and habits in private life. The leading article of the number also deals with the same subject, and records some highly-suggestive First Impressions of the New Republic, by Frederic Harrison. The other articles in the number are as follows: Psychometric Facts by Francis Galton; Godwin and Shelley, by Leslie Stephen; A Cremation in China, by Herbert A. Giles; On the Migration of Birds, by Dr. August Weissmann; Loves's Promise, a Poem; Chapters on Socialism, II., by John Stuart Mill; Charles Lamb—Five New Anecdotes; Mademoiselle de Mersac, chapters VI. and VII; Why do we Eat our Dinner? by Professor Grant Allen; Cruel Fate; Ancient Egypt, III, by Reginald Stuart Poole; A Romance of Royalty—Lady Arabella Stuart; The New Religious Movement in France, a very striking and suggestive paper; The Two Lights, a Poem; Literary Notices; Foreign Literary Notes; Notes On Science and Art; Varieties.

THE CHRISTIAN UNION for April 16th contained the first of a series of articles on French Cookery of To-day, by L. Delmonico. It defined and explained what French cookery really is, contrasting it with American, and afforded considerable information in regard to its history and growth, both in its native land and in the climes of its adoption, with special reference to its hygienic and economic features. The second will analyze the system of the French dinner, and explain the philosophy of its service, whilst the remainder will contain specific directions for the preparation of those light dishes which are tasteful and wholesomely appetizing, yet inexpensive; and which in themselves constitute the chief attraction to gross feeders when occasionally indulging at Les Freres' Provenceaux or Chevet's, during a visit to Paris. Both to master and mistress of the house we venture to predict this series of articles will be especially welcome and suggestive of pleasant fare in that trying time to housekeepers—the heated term.

CONDUCTED BY EMILY MAPLE.

LOG-CABIN SKETCHES; OR, JESSIE SEABRIGHT'S DIARY.—No. 5.

MAY MAPLE.

An Unwoven Rag Carpet.

MAY 5th, 18—. Very many of the long winter evenings I spent in sewing carpet rags. Of course, we had an occasional cast-off garment, but not enough to keep one busy. When my neighbors found that I was saving all my little scraps for a carpet, they thought it would be a niee idea to have some of the rough, old cabin floors hidden from sight. And although it might be some time before they could have the rags woven, they would be less trouble if they were cut and sewed and wound into snug balls; and as they offered me a share if I would prepare them for the weaver, I accepted the proposition at once.

It was not the most pleasant work in the world, but then I was not looking for dainty employment, away here in the wilderness. I was anxious to have my humble home a pleasant abiding-place; and I was not afraid or ashamed to take hold of work, however lowly, so I could accomplish my purpose. Our floor was made of rough, unplaned boards—for pioneers are usually glad enough to get a roof over their heads, and seldom spend time for the niceties; for, of course, they will build a good house in a year or two at most—a pretty ideal, but seldom realized. The green lumber soon shrank, and made wide spaces between the boards. So, no matter how much pains I might take with my floor, it would never look nice. And although there were many old giants in the forest close at hand, that would have made most charming flooring, yet they could not be utilized at present; for the sawmill was too far away to think of hauling logs to it, or of drawing lumber, except for pressing necessities. John sometimes asked why I was so much engaged in sewing carpet rags, when there was not a loom in the whole country round. How did I ever expect to get a carpet made under such circumstances? "Wait and see," was my invariable reply. And the balls continued to grow from evening to evening.

But after I had secured a certain number of pounds for myself, I began slowly to unwind them from day to day, when Bertie and I were alone. My carpet was growing slowly but surely, and in pretty stripes. I was never lonely now, although there were weeks together when John was away to work all through the day, and guests were not numerous, for the snow was too deep to permit of much pedestrianism. My mind was as busy as my fingers. I was looking forward to the glad spring time, that at length arrived.

And now my house-cleaning is all done; wall freshly covered, with clean newspapers, and bordered with fresh evergreens; window panes glistening; the long curtains bleached as white as can be; lounge and chair covers washed, starched and ironed, look as fresh as new, and my floor is nearly all covered with my new carpet, which is bright and neat in appearance. And all the work of my own hands! To be sure, it will not wear for a quarter of a century, for it was *knit* garter stitch, on coarse, wooden needles, in breadths half a yard wide; the dark stripe, was "hit and miss;" while the fancy stripe was of red, shading to a light pink in the center, with a dash of orange at the sides. I am quite sure it will wear long enough to pay me for all my trouble.

You should have seen John's eyes open wide, when he came in from the field just as I was driving the last tack in the carpet upon the floor.

"Who wove that carpet for you?" was his first inquiry, but not his first exclamation.

"Mrs. Jessie Seabright, your honor," was my reply. "Isn't it pretty?"

"Why, yes! it's as handsome as a picture. But how did you weave it, is what I want to know." And when I told him all about it, he said:

"Well! well! it is strange how many ways a woman will devise to make a cabin look almost luxurious."

THE WIFE'S ECONOMY.

IT is astonishing to see how well a family can live upon a small income when the wife and mother is handy, industrious and economical. The husband may earn but ten or twelve dollars a week, yet they make a far better appearance than their neighbor who earns twice or thrice as much. This neighbor does his part well, but the wife is good for nothing. She will even upbraid her husband for not living as nicely as her neighbor, while the fault is entirely her own. The difference is, that the one wife is a neat, capable woman, while the other is a whirlpool, into which many silver cups might be thrown and the appearance of the waters would remain unchanged. For such a woman to talk of her love and devotion to her husband is but an insult to him. MARY B.

DOMESTIC RECIPES.

Cooling Drinks.

LEMON BEER.

Put into a keg one gallon of water, two sliced lemons, one tablespoonful of ginger, a scant pint of good sirup, and one-half pint of yeast. In twenty-four hours it will be ready for use. If bottled, the corks must be tied down.

SODA BEER.

A very cooling summer drink may be made by adding to two quarts of water two pounds of white sugar, the beaten whites of two eggs, two ounces of tartaric acid, two tablespoonfuls of cornstarch, mixed smooth in a little of the water. Put over the fire and boil two minutes. When cold, flavor with wintergreen. Bottle, and when wanted for use, dissolve in half a glass of cold water a third of a teaspoonful of soda, and then pour into it two tablespoonfuls of the bottled mixture. It will foam to the top of the glass.

GINGER DRINK.

Put to six gallons of water eight pounds of loaf sugar, the beaten whites of three eggs, and three ounces of the best ginger. Powder the ginger finely, and mix with a little water before adding it to the mass. Boil gently for three-quarters of an hour, removing any scum which may arise to the surface. Let cool; add the juice of three or four large lemons and a teacupful of yeast. Put into a cask and bung it very tightly. It will be fit to use in ten days.

RHUBARB TEA.

Boil, or rather simmer, two pounds of rhubarb for an hour or two in a quart of water; strain into a pitcher, adding water to make up the quart. After it is cold, add the juice of a lemon, and sugar to sweeten.

GINGER BEER.

Ten pounds of sugar, nine ounces lemon juice, one half pound of honey, eleven ounces of bruised ginger root, nine gallons of water, and three pints of yeast. Boil the ginger half an hour in one gallon of water and then add the rest of the water and the ingredients and strain. Add the beaten white of an egg, one-half ounce essence of lemon and let stand four days when it may be bottled.

GINGER POP.

Boil two ounces of best, white Jamaica ginger root in six quarts of water for twenty minutes, strain, add one ounce of cream-of-tartar and one pound of white sugar. Put over the fire and stir until all of the sugar is dissolved and then put into an earthern jar. Now put in one-fourth ounce of tartaric acid and the rind of one lemon. Let it stand until one can bear his finger in it with comfort and then add two tablespoonfuls of yeast. Stir well, bottle and tie down the corks. Make a few days before wanted for use.

WHITE SPRUCE BEER.

Dissolve ten pounds of loaf sugar in ten gallons of boiling water; add four ounces essence of spruce, and when almost cold, add one-half pint of good yeast. Keep in a warm place, and the next day strain through flannel; put into bottles and wire the corks. A. E. M. B.

Livingston Co., N. Y.

Hoe-Cakes.

The genuine Southern hoe-cake is made of corn-meal and water, with a little salt, and worked with the hands until stiff enough, so that it will neither run nor crack when patted down and made into little loaves an inch or two in thickness. Bake as already described as also in the ashes, when it is called ash-cake It is as innocent of sweet or any other kind of milk as is the Potomac river, and is mighty poor food at the best. M. B. P.

Pine-Apple Pie.

Pare and grate one good-sized pine-apple; cream, one cup of sugar, and a third of a cup of butter; beat the yelks and whites of five eggs separately. To the cream, butter and sugar add the yelks, then the apple, and lastly, the whites.

Bake in open shells of paste. Eat cold.

Canned Pine-Apple.

Make a sirup in the proportion of three pounds of granulated sugar to three pints of water; boil five minutes, skim and add the sliced pine-apple; boil until clear and tender. Have the cans hot, fill and seal as quickly as possible. MRS. KATE BRADY.

Baked Cup Custards.

Scald one quart of new milk and pour it over the beaten yelks of five eggs; sweeten to taste, flavor with vanilla and stir in the whipped whites of two eggs. Pour into stoneware cups, place in a pan of boiling water and bake until the custard is set. Make a meringue of the reserved whites and a little powdered sugar, and spread over each cup. Bake until of a delicate brown. Serve when cold in the cups in which they were baked.

MISS EMILY HALL.

Short-cake.

Short-cakes, as made fifty years ago by an aunt of mine, were made by adding one-half pound of butter to one quart of tepid or warm water, with flour to make the dough just right to knead a long time—from one to two hours—as therein lay the secret of lightness. About one-fifth of the butter should be reserved to roll in just before putting the cakes to bake, which was done by placing the pie-tins against a long stick of wood lying on the hearth before the kitchen fire. The cakes were made three-fourths of an inch in thickness, or less, and about eight inches in diameter, and placed on the tins facing the bright fire, which would soon roast one side a nice brown, when they were turned and roasted on the other side. The slashing an inch apart which these cakes received before baking, made them break easily without mangling, when they were put on the table. I give this bit of New England cookery of years ago in answer to an inquiry. If we now must have short-cake, we can do no better than to mix with cream not too old.

Minnesota. AUNT FLORA.

Brown Thickening for Gravies.

Take half a pound of flour and sift it after drying it thoroughly on a newspaper before the fire. Melt half a pound of butter in a porcelain saucepan; skim the top and pour off all that is as clear as good salad-oil. Wash out the saucepan and pour in the melted butter and flour; stir over a quick fire with a wooden spoon. The stirring must be continued until the whole mass begins to change color. As soon as of a light fawn color, take from the fire, throw in a large slice of onion—this will give the thickening a nice flavor—and keep stirring until it stops bubbling; take out the onion and turn into an earthen pot. When cold it has the appearance of light-colored chocolate, and very little will give a rich brown look to gravies. If rightly made it will keep good for weeks, and as brown thickening is almost a necessity where gravies and sauces are properly made, I have found it convenient to prepare two or three pounds of butter at a time.

MRS. ATKINSON.

News of the Week

MISCELLANEOUS.

Monday, May 5, 1879.

Professor Comstock, of Cornell University, succeeds Professor Riley, as Entomologist of the Agricultural Department, Washington. Twin Le Ducs is the latest news from that quarter. We have a strike here of upwards of 3,000 longshoremen, against a reduction in their present wages of 25c. an hour. If they could get steady work, they'd accept the cutting-down, but most of them can get work only for two or three days a week. The loading of ships accordingly is greatly delayed, while green-hands do the work so unskillfully that there will be danger of the cargo shifting at sea, thus endangering the safety of the vessel and its passengers and crew. All quiet hitherto. Both parties still confident of victory. We are to have a new telegraph company called the Union, with Jay Gould at its head. 'Twill gobble up all the small telegraphic fry not already swallowed by the Western Union. 'Twill reduce charges on messages and be a public benefactor generally, until the shrewd speculators that run the "machine," can see their opportunity for making a "pile," by "bleeding" the ordinary stockholders or "selling out" to their gigantic rival. April reports to the Department of Agriculture show that all classes of farm animals came out of winter-quarters in unusually good condition. The diseases are not of very great extent or virulence, except among hogs in the South and West. Large losses from so-called hog cholera are reported in some counties, but in most of these cases the mortality may probably be traced to a bad sanitary condition and deficiency of feeding. Four counties in New Jersey, one in New York, one in Pennsylvania and one in Maryland note the presence of pleuro-pneumonia; but the cases are believed to have nearly all originated in the dairy stations of the cities.

Openly hippophagy, or eating horse flesh, has not been practised to any extent in this country hitherto; but the health officer of Jersey City has just discovered that the makers of "fine country sausages" in that burgh, have been very extensively mixing that kind of meat with the other ingredients of the sausages designed for the markets of this and the neighboring cities. New Orleans has got rid of half a million of its debt by going quietly into the market and buying up its own bonds at 25c. on the dollar—a justifiable case of shaving one's own paper. 'Tis a pity that one of the best enterprises in the South has come to an unsuccessful end—a cotton factory started with high hopes in Atlanta, Ga., some time ago, has just been sold out by the Lowell parties who sold it the machinery, but couldn't get their pay.

The Supreme Court has just decided that a juror in the South who may be challenged and asked whether he took part in the rebellion, is justified in refusing, to answer and in the absence of proof of his participation therein, that he is competent to serve. Judge Field went further and declared the law requiring a test oath from jurors as to past conduct unconstitutional in time of peace. Judge Strong alone dissented from the opinion of the Court. The negro exodus from the South still continues. It is estimated that 8,6000 of the emigrants have arrived in St Louis since the opening of the year, most of whom were too poor to continue their journey to Kansas. Wayondotte Kansas, has 5,500 of them encamped in the suburbs, sick, helpless and penniless, a burden, and menace to the community. Vigorous efforts are being made here and there throughout the country among old abolitionists and ardent young Republicans to raise money to relieve the destitute and, still more, to add to their numbers. Fred Douglass, Pinchback of La., and Senator Bruce of Miss., the three most prominent representatives of the colored race, are strongly opposed to the movement.

As feared by the Democrats and hoped for by the Republicans. Pres. Hayes has vetoed the bill passed by both Houses of Congress, appropriating money for keeping up the army. His chief objection to it was that it was loaded with a "rider" prohibiting under any circumstances the presence of U. S. troops at the polls on State or Federal election days, except to resist foreign invasion. A Democratic caucus has just decided to present this obnoxious "rider" in the form of a separate bill, "railroad" it through both Houses, and withhold action on the appropriation Bill until it is seen whether the President will veto the measure thus presented. If he doesn't, the appropriation for the army will be granted, and the fight renewed over that for paying the expenses of U. S. Courts. But should his backbone remain stiff long enough to veto this bill also, then the present indications are good for a lively struggle between the Legislature and executive branches of the government.

There is a rush of emigrants from Southern Arkansas, Kansas and Missouri into the Indian Territory, and another appropriation of Indian lands, like that which lately occurred in the Black Hills, is very probable. The President has issued a proclamation strictly *forbidding* any occupation of lands belonging to the aboriginies, and ordering the military to expel those who have already settled there; General Pope has declared that he has troops enough to enforce the order; but the rush still continues, and it's not likely that Pope will be more successful in driving back the immigrants than he was in driving back the Confederates.

FOREIGN.

There is a reign of terror in Russia After the attempt to assassinate the czar the other day, the police increased their zeal in making arrests of all those suspected of Nihilism. The jails are thronged with prisoners of all ranks, but chiefly of the middle class. Vast numbers are banished weekly to the mines and desolate steppes of Siberia. All assemblages of the people after dark are prohibited in St. Petersburg. The Czar and his chief officers go about surrounded by strong guards, and fears are lively of a popular insurrection at any time. In Germany the chief agitation is still over the tariff question. Bismarck is vigorously pushing the imposition of duties on foreign goods in order to protect home industry, while the advocates of free trade, are earnest in their opposition to such a measure. The latest advices indicate the probability of a tax on the importation of grain from this country and the prohibition of cattle importations from this side of the Atlantic.

The Bulgarians have elected as King, Prince Alexander of Battenberg, a German princeling, whose chief merit appears to consist in his being the nephew of the Empress of Russia. Great agitation still continues in Eastern Roumalia, the object of which is to force a union of that Turkish Province with the brand-new kingdom of Bulgaria. Such a union is only a question of time anyhow. Greece has got all she asked for from the Porte except the town of Zanina, and her persistent demands will probably secure that too.

Distress, especially among the agricultural classes, is still the chief feature of Great Britain's domestic affairs. Col. Peason, who was beset by the Zulus in Africa, has been released from his dangerous position, and with the rest of the English forces, has retreated from Zululand. Cetywayo and his chiefs are suing for peace, and a speedy settlement is not unlikely. Yakoob Khan is also disposed to come to terms out in Afghanistan, so that the cessation of foreign wars will probably soon leave the government time to attend to home affairs. HERMAN.

VARIOUS.

Portable gas is sold and delivered in England like milk. People in the country and in villages receive it in copper vessels from large cities. This method is additionally popular from the fact that it dispenses with the erratic and depraved meter.

One hundred and sixty-two authentic cases of living burial are put on record by the eminent French physician, Dr. Josat. The period of unconsciousness before burial, in these cases, lasted from two hours to forty-two. The causes of apparent death were these: Syncope, hysteria, apoplexy, narcotism, concussion of brain, anæsthesia, lightning, and drunkenness.

COLLEGE-BRED CONGRESSMEN—Including senators and representatives, the prominent colleges are represented in Congress by graduates as follows: Harvard 6, Yale 6, Bowdoin 5, Union 6, Dartmouth 5, Princeton 4, Brown University 4, West Point Military Academy 5, Michigan University 4, Williams 1, Hamilton 2, Rutgers 4, Dickinson 6, Western Reserve 2, Antioch 2, Oberlin 2, Miami 3, Kenyon 2, Asbury University 3, William and Mary 2, University of Virginia 7, University of Alabama 4, University of Georgia 8, academic education 116, common school education 43.

Facts about the city of London are always interesting, and we find a few in the Cornhill Magazine. London is spread over about 7,000 square miles. There is one death there every six minutes, and one birth every four. The growth of the population is at the rate of 75,000 a year, or 205 each day. The total length of streets in London is about 7,000 miles; there are built every year about 9,000 new houses, by which the length of the streets is

increased twenty-eight miles. In the jails there is an average of 75,000 prisoners. The foreign-born residents of London number about 100,000; but thirty-seven per cent. of the whole population were born out of the city.

The verdict of half the World.—The entire western hemisphere pronounce Murray & Lanman's FLORIDA WATER the most delicious perfume for the boudoir, the ball-room, and the bath, that chemistry has yet succeeded in extracting from living flowers.

That furred tongue, bad tasting mouth and miserable feeling, says you need Hop Bitters.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, May 3d, 1879.

BEANS AND PEAS.—Marrows are quiet, Cubans having little to encourage large purchases. Mediums steady with moderate sales. White kidney and pea beans continue quiet. Red kidneys strong, with stock giving out. Green peas firm and well controlled, $1.75; Canadian in bulk and bbd nominal at 75c. B. E pea-, $2.50 ₱ 2 bush. bag. Medium beans, choice, $1 30@1 32½; fair to good, $1 15@1 25. Marrow, prime, free on vessels, $1 40; fair to good, $1 25@1 35; pea, $1 20@1 35; white kidney, $1 30@1 50; red, $2 80@3 00; black, $2 15@2 25. California Lima, $4@4 25.

Receipts for week, beans, 5,021 bush.; exports, 926 bbls.; do, peas, 1,197 bush.

BEESWEEX.—Small transactions are in progress, and 24@25c. quoted for Western and Southern.

BUTTER.—There is a tame feeling in all grades of new. The closer we approach grass the more independent buyers become, and to prevent accumulation of white hay stock sellers are forced to make concessions. All useful old is about gone. There is a movement for the purpose of reducing the quantity of returnable creamery pails this season. Dealers assert that they could handle surplus creamery for export use with more ease if it were packed package free. Exporters are already using some new fine creamery.

OLD BUTTER ranges at 7@12c. for State, Welsh tubs, half tubs and firkins: creamery, 10@14c.; Western June firkins, 7@8c.; poor to fair factory, 5@6c.; grease, 3@4½c.

NEW BUTTER.—State pails and half tubs, choice, 15c.; good to prime, 12@13½c.; fair to good, 10@12c.; Welsh tubs, choice, 12@14c.; good to prime, 10@12c.; poor to fair, 8@10c.; State creamery, best invoices, 17@18c.; good to prime, 13@16c.; Western, best invoices, 17@18c.; fair to prime, 15@16c.; Imitation creamery, 12@14c.; Western, dairy, fair to best, 11@13c.; factory, 10@12c.; common, 6@8c.

COMPARATIVE RECEIPTS AND EXPORTS.

" 1, '75 " " 1, '76	1,049,973	33,060

Receipts for week, 23,232 pkgs. Exports, 5,223 do.

CHEESE.—The receipts of new are of small lots only, and transactions are more of a jobbing nature in them; 6@6¾ are about the best general rates, but there is here and there a parcel running up to 6¾, from this to 3 for the commonest, represents the market. It is estimated that the stock of old is in the neighborhood of 20 000 boxes, and there is every prospect of getting them cleaned out in a few days.

Quotations for old are 7½@8c. for fine lots; 6@7c. for good; 5@6c. for fair; 2@3c. for skimmed; 3½@5½c. for half skimmed. Wisconsin factory, fine, at 7½c.; do. good to prime, at 6@7c.; Western factory, fine 7c.; good and prime, 5@6c.; do. full skimmed, 2@3½c.; do. half skimmed, at 3@4½c.

Receipts for week, 8,580 boxes.

Liverpool cable, 40s.

Steam, 30s.

Strict good ordinary	11⅜	Middling	11 11-16

DRIED FRUITS.—Apples have shown a moderate export inquiry, but otherwise trade has been very slack; prices are unsettled, and for most grades rather easy. Peeled peaches are held steady, but they have but little attention; small fruits have been quiet and prices unchanged.

Quotations are for apples, evaporated, Alden's & William's 10½@11c. for best; do. new process at 8@8½c. State plums, 13½c.; Blackberries quoted at 4½c. Peaches—Peeled Georgia, 7@7½c. for poor; 8½@9c. for fair to good; 10c. for prime; choice North Carolina, 12@13c.; good do., 11@10c.; unpeeled halves, 3@3½c. quarters, 2½@3c. Pitted cherries, 20c. Apples—New, 2½@2¾c. for Southern quarters in bags; 3¾@4c. for prime sliced; do., fair and good, 3@3½c.; State at 3½@4c. for new sliced; and 3¾@4c. for quarters; Western at 3¾@4c. for new quarters. Raspberries, 30c. bld.

Exports for week, 788 bbls. dried apples.

EGGS.—Receipts for week, 16,500 bbls.; do. last week, 14,480. There is a fair demand, quality being much superior to stock last spring, when so much stored, fresh and limed was in market. Prices are low, as there is an abundance of spring produce in that cuts up the local trade. Dealers do not look for much lower prices.

Near points, hen, 12½@13c.; State and Penn., 11½@11¾c.; Western, 11¼c.; Southern, 10½@11c.; poor, 10c.; duck, 12c.; goose, 18@20c.

FLOUR.—There has been a more active trade from home sources, and shippers are buying moderately with prices the turn stronger.

Latest prices are $3 25@3.65 for inferior to very choice superfine State (fancy lots shade higher); $3.60@3.85 for poor to good extra do., odd lots and lines; $3.85@4.25 for good to very choice do.; $3.25@3.60 for inferior to very choice superfine Indiana, Iowa, Michigan, &c.; $3.50@3.85 for very inferior to good shipping extra do., and $3.85@4.25 for good to very choice extra do.; common to about choice white wheat extras, $4.00@5.00; choice to fancy do. at $5.15@5.15; red and amber winter wheat, inferior to very choice trade and family, at $3.90@5.75; round hoop Ohio at $3.85@4.25, and trade and family brands of do. at $4.25@5.75, the latter rate for very choice; St. Louis, $4.00@5.00 for very inferior to good extra; $5.00@5.85 for good to very choice (with a few very fancy brands up to $6.50); Minnesota clear, very inferior to fancy, at $3.60@4.75, few brands going above $4.50; Minnesota "straight," very inferior to strictly choice at $4.25@5.75; and patent poor to strictly fancy at $5.25@8.50, few brands going above $7.50; unsound stock at from $2.25@5.00; city mill extra at $4.70@5.25 for West Indies (the latter rate for very fancy in new packages); chiefly at $4.70@4.90; do. for England $3.60@3.85; do. trade and family extras, $5.25@6.25; do. for South America, $5.15@5.65 for fair to very choice; No. 2 at $3.35@3.25 for poor to very choice.

FRESH FRUITS.—Best apples are becoming tender and holders are shading prices. State russets, Baldwins and Ba dwins prime, $2@2.25 per bbl.; very poor, $1@1.50. Exports for week, 2,050 bbls. Cranberries nominal at $7@8.50 per bbl.; crates, $2.25@3. Strawberries have run poor this week. Good Chas., 70@4c.; good but useful, 15@25c. Peanuts have advanced with a speculative demand; sales for consumption only moderate. Va. hand picked, $1.2?@@1.40; other, $1.15@1.25; shelled, 4¾@5¼c.; pecans, (Texas) 6@8c.

HOT-HOUSE PRODUCTS.—Sales restricted to few buyers at this season. Black Hamburg grapes, $2@2.50. Strawberries, 75c.@$1.50. Radishes, 100 bunches, $1.50@2. Cucumbers, doz., $1.50@2. Mushrooms, 50c. Lettuce, $2@6 per 100.

FURS AND SKINS.—At the Leipsig there was a decline of 10@20 per cent. on the principal goods, compared with the London sales of March. A large portion of the offering was withdrawn.

GRAIN.—The reports of dry weather at the West have been seized upon by speculators to influence values, and some help has been given the rising tendency by improved export demands. Latest sales of wheat are of No. 2 spring at 99c.@$1 03; No. 3 spring at 90¼@92c.; No. 4 spring at 85c; rejected spring at 76@78½c.; ungraded spring 80c.@$1 02; mixed winter at $1 13¾; ungraded amber at $1 08@1 11¾; No. 2 amber, at $1 11¾@1 12¾; ungraded red at $1 05@1 13; No; 2 red at $1 14¼@1 11¾; No. 3 red ungraded white at $1 10@1 12; No. 2 white at $1 10@$1 11; No. 3 white at $1.08; No. 1 white at $1 11¾@1 12; New York No. 2 spring, June option at $1 09¼; No. 2 amber, May option, at $1 13@1 13¾; No. 2 red, May option, at $1 11¾@1 14¾; do., June option at $1 14¾@1 15; No. 1 white, May option, at $1 12; do., June option, at $1 12¾@1 12¾. Rye at 58¾@61¾c. for State. Corn at the close selling at for New York No. 2 at 43¾@44¼c.; New York steamer mixed at 42¾@43¾c; No. 3 at 41¾c.; ungraded western mixed at 42¾@43½c.; New York No 2 white quoted at 47c.; New York steamer white at 46c.; New York steamer yellow at 45¾@46c.; New York low mixed at 44@44½c.; yellow southern at 42c. for very poor; New York No. 2 May at 43¾c.; do., June, at 44c.; New York steamer mixed, May option, at 42¾c.; do., June, at 42½. Oats at for New York No. 2 white at 35¾@35½c.; New York No. 3 white at 34c.; New York No. 2 at 33@33¾c.; New York No. 1 white at 38¼@39c; New York No. 1 at 33½c. bid and 34@34½c. held; New York No. 3 at 32¾@32¾c.; white Western at 33@37c.; mixed do., at 32¾@33¾c.; white State at 37@37½c.; No. 2 Chicago at 33¾@34c., afloat, and 32@32½c., in store. In Barley transactions are chiefly of a private character. Quotations understood to be easier than before.

HAY AND STRAW.—Receipts generally are small and a very fair call for supplies tends to place prices upon a firm basis.

Sales at 40@45c. for shipping, and 70@80c. for retail qualities. Straw at 40@45c. for long rye; 35c. for short rye, and oats at 30@35c.

Exports for week, 2,675 bales.

HOPS.—There has been a freer demand from brewers and a light call from exporters; the shipments this week only 360 bales; prices have not varied, with most of the business in grades at 5@7c.

Quotations are for New York's, new crop, choice, 9@12; New York's, new crop, medium, 7@8; New York s, new crop, low to fair, 5@6; Eastern, 6@9; Western, 6@9; Yearlings, 2@4; Olds, all growths, 1@2; Pacific coast, nominal, 8@12.

LEATHER.—Of hemlock sole sales at 18@19¼c. for light; 18@21c. for middle; 19@21c. for heavy; and 16@18c. for good damaged.

MAPLE SUGAR.—Market well supplied and trade not sharp. Prices, of course, easy. Fair to choice, 7@10c.; sirup, 75c. ₱ gal., in tin.

OIL-CAKE.—Western quoted at $27.25@27.50.

POULTRY AND GAME.—Prices for live poultry will be apt to rule easy. Receipts to show the usual increase of spring. The recent decline in fowls has brought some export call for the W. I.

Spring chicks, 75c.@$1.25 ₱ pair; N. J. fowls, 10½@11c.; Western, 10c.; Southern, 10c.; roosters, 5@6c. Turkeys, N J., 15c.; Western, 12@14c. Ducks choice, 90c@$1; other, 65@75c.; choice geese, $1.50@1.75; Southern and Western, 75c.@$1.37. Pigeons, 35@40c.

Country-dressed poultry is barely a special market item. The few parcels of near points and dry-picked are handled by those who have steamer and hotel trade to depend on. For local use city killers can supply all that is needed. Market easier.

Turkeys, best fresh killed, 17@18c.; the latter for Pa. dry-picked; other, 15@16c.; fowls, choice, 12@13c.; other, 9@11c.; capons 26@27c.; slips, 23@25c.; ducks, best, 17@19c. Dry-picked spring chicks, 50@55c.; winter broilers, 35@38c.; do. roosters, 21@22c.

The supply in small and chance birds are firm.

English snipe, $1.25@1.50 ₱ doz.; plover, 1.12@$1.37; small snipe, 30@40c. Wild pigeons, trapped, $1.75@2; do. shot, $1.25@1.50. Tame squab, $2.50@3.

PROVISIONS—Have tended a little higher and demand fairly active. Latest sales are for Mess pork, May at $10 10 bid and $10 20 asked; June at $10 10 bid and $10 30 asked; July at $10 15 bid and $10 30 asked, and August for at $10.?5 bid and $10.40 asked. Bacon at $5 for long clear and 5 3-16 for short clear. Lard—Western steam, at $6 25 for spot lots; $6 28½@6 25 for May and June; and $6 30 for July. Tallow at 6½c. for prime. Stearine at 6¾@7c. Beef hams at $15@15.25. Beef at for extra India mess, $20@22, as to quality; packet, $11@11.50; plain mess, $9.75@10.50; extra mess at $10.50@11.50.

SEEDS.—Clover is in moderate demand, with Western quoted at 6@6½c. for prime and 6¾@6¾c. for choice. Timothy is quiet at $1.35 for prime.

SUGAR.—Refined at 6@7¼c. for soft yellow; 7¼@8c. for soft white; 8¼@8¾c. for granulated and powdered; 8¾c. for crushed, and 8¾@8¾c. for cut loaf.

TOBACCO.—Trade has been very slack this week in both Western leaf and Seedleaf, but offerings not urgent and prices generally steady and as quoted last week.

VEGETABLES.—Potatoes weak from natural cause, advanced season and varied stock of other stuff. Best are about 25c. off. Southern truck has arrived in rather uneven order. We quote only marketable stuff. Southern Early Rose and Eastern, $3 25@3 50; State, choice, at $2 75@3; fair to good, $2 50@3; Peach Blow, white, in bulk, $3@3 25; red, $2 75@3.25; Prolific, $3; Peerless, State, $2 50; Jackson White, $2 75@2 87; (outside rate per double heads). Sweet potatoes, Md. & Del., $3 50. Onions, red and yellow, $2@2 75; Squash, marrow, $3 50@4. Cabbages per 100, $6@10; Rhubarb, 100, $1 50@3; R. turnips, per bbl., $1@1.25; beets, 75c.@$1.00; carrots, $1@1.12. Horseradish per bbl., $6@7. N. J. Asparagus, $3@6; Southern, $3@4 50. Southern Items—Fla. potatoes, $5@6; do., $2@3; String beans, Fla., per bush, or., $1@2 25; green peas, Chas. and Sav., small, $1 50; asparagus, kale, $1 75; Baltimore, ₱ bag, 25c; spinach, Baltimore, ₱ bbl., $1@1 25; radishes, Norfolk, ₱ 100 bunches, 25@75c.; cabbage, Sav., new, ₱ bbl., $3@3 50; Norfolk, $1 50@3. Fla. cucumbers, crate, $2@3 50; onions, Bermuda, ₱ crate, $1 25@1 50; tomatoes, box, $1@1 25, potatoes, $7@7 50.

WOOL.—There has been but little interest shown by manufacturers the past week, and they have been buying only as supplies were forced at easier prices. There is a general effort to clear out supplies before the new clips come to hand.

Ohio, Pennsylvania and Virginia—XXX and picklock, 36@37½c.; XX, 33@—c.; X, 31½@32½c.; No. 1, 32@34c.; No. 2, 32@33c.; common, 29@30c.; combing, 36@38c.

New York, Michigan, Indiana and Wisconsin—XX, 30@32c.; X, 29@31c.; No. 1, 31@32c.; No. 2, 27@30c.; common, 26@28c.; combing and delaine, 33@37c.

Iowa, Vermont and Illinois—X and XX, 28@30c.; No. 1, 30@33c.; No. 2, 27@28c.; combing, 33@36c.

Missouri, Kentucky and Tennessee—Washed fleece, 30@33c.; unwashed fleece, 18@24c.; unwashed combing, 22@25c.

LIVE STOCK MARKETS.

NEW YORK, Saturday, May 3d,

BEEVES.—Receipts for the week, 10,042 head; do., last week, 9,769 do. Medium grades of stock have done best for owners. Prime and heavy grades are relatively low. Poor to fair steers sold at 8¾@9¾c. per lb., to dress 55@56 lbs.; good and prime do. at 10@10½c., to dress 56@57 lbs.; few tops at 10½c., to dress 57 lbs. A car load of poor straw-stanked-wintered Michigan steers reached the low mark of 8¾c. per lb., followed by 3 cars of still-fed Colorado cattle at 9c., to dress 55 lbs. An experiment will be made this week by shipping dressed meats in a patent compartment containing dry air, thought to be a great improvement upon the use of ice.

COWS AND CALVES.—There are hardly receipts enough to make a market, but there is no encouragement for increased supply. Nominal rate, 30@50c. for fair to good milkers with calves at side.

VEALS.—A better feeling has prevailed this week and moderated arrivals have strengthened prices. N. J. and Buck's Co., 5¾@6c.; good do. and best State, 4@5½c.; other grades, 3@4c. Hog-dressed best, 7@7½c.; fair to prime, 5½@6½c.; common, 4½@5c.

SHEEP AND LAMBS.—Receipts for the week, 22,900 head; do. last week, 30,823 do. The market has dragged and the prices were not cleared. A car-load of poor unshorn sheep, 52 lbs average, went as low as 4¾c. per lb., and the best unshorn reached 6¾c. Clipped sheep sold at 4½@5¼c. per lb; some Jersey lambs at $4@4.50 per head, and a small bunch of good Virginia do. at 9c per lb.

SWINE.—Receipts for week, 27,925 head; do last week, 28 923 do. Supplies going mainly to packers. Nominal N. Y. rate, $3.90@4.00 per 100 for good corn hogs.

Country-dressed pork, light, 6@6¼c.; medium, 5¾@6c.; heavy, 5@5¼c.; city, 5@5¾c.

Portable Steam Engines

Five to Twelve Horse Power.

Especially adapted for Cheese Factories and Creameries. Also, AGRICULTURAL and STATIONARY ENGINES. Send for Circulars. Address as above.

Prout's Hoeing Machine.

Worth double its cost to any farmer for hoeing Tobacco, Cabbage, Corn, or any other hoed crops. Has been in use in the Connecticut Valley for the past four years, and has more friends than any other implement for hoeing by horse-power. For further particulars, send for illustrated Catalogue to

THE BELCHER TAYLOR AG'L TOOL CO.,
Chicopee Falls, Mass.

GRAVES' PAT. RUBBER TARGET GUN.

An entirely new principle. Shoots Arrows or Bullets almost as straight as a RIFLE. Adapted to all ages.

$1.50, delivered, free of cost, throughout the U. S. on receipt of price; or, sent by express, not prepaid, for **$1.00.** Clubs of six supplied with Guns at a low rate.

JOHN WILKINSON, Sole Man'f'r, 77 State St., Chicago.

Send also stamp for my elegant New Catalogue of **Scroll Saws, Lathes, Archery, Base Ball, &c.** I have the best goods in market, and all at manufacturers' prices. I am publisher of Hope's and Ware's Designs, and sole importer of the genuine "Wilkinson Saw Blades."

HORSFORD'S Bread Preparation

UNSURPASSED FOR MAKING
LIGHT BREAD,
Biscuit, Rolls, Cake and Pastry.

It is Better and Healthier than ordinary Baking Powder. Cream Tartar or Yeast.

The cost of raising Bread, Biscuit, &c., with it is only about half as much as by ordinary Baking Powder, and the result is much better.

It restores the nutritious elements which are taken from the flour in bolting. No ordinary Baking Powder or anything else used for raising bread does this.

Universally used and recommended by prominent Physicians.

If you cannot get it of your Grocer send a three-cent stamp to the manufacturers for a sample.

Manufactured according to the directions of Prof E. N. Horsford, by the Rumford Chemical Works Providence R. I.

JAPANESE MAPLES.

Rhododendrons, Hardy and Greenhouse Azaleas, Camellias, Roses, Magnolias, Purple Beeches, Fruit Trees, Shrubs, Vines, etc.

LAWN PLANTING

Reading for the Young.

TO THE SONS OF THE FARMER.—No. 7.

REV. A. W. MANGUM.

Let us see if there is as much difference as is often assumed between the income from a useful industrial pursuit and that from a learned profession. Take the occupation of the farmer as an example of the first. Suppose a young man, of sound body and mind, with good habits, begins at the age of twenty-one. The first year he hires for wages, receiving $10 a month and his board. That board is worth $125. He also has the use of his room and necessary furniture. He enjoys many opportunities of improving his mind, and is gaining information about farm life in the experience of every day. He is not subjected to any current loss, as he works with utensils and horses that belong to his employer. Granting that he has spent half of his receipts for clothing and incidentals, he closes the year with $60 and his experience and improvement as his profit. This is the result of no investment, but simple labor, and that labor such as we may call uneducated. If he is faithful he is likely to receive increased wages; or, at any rate, to have opportunities to turn extra pennies. If he shows himself true and profitable to his employer, he will soon be at a premium. Continuing to discharge every duty well, he will be able, at the age of twenty-six, to procure a small farm of his own. He has thus, with little or no investment, made a living, established a character, won experience, earned a home, and secured a basis for independence and a permanent livelihood. By the time he is thirty, he may reasonably hope, he will have a good little farm, stocked with all the requisites for its successful cultivation. When he counts up his gains at the end of the year, after he is thirty, he may be discouraged to find that he has only a small amount of actual money, or only a few surplus products that he can sell. But consider. He has lived on the products and proceeds of his farm through a whole year. If he has tried, he has improved several acres of land. He has another year of instruction in direct experiment. He has, probably, made additions of value to his implements or his stock of some kind. Thus he goes, from year to year, all the while making the support of himself and those dependent upon him, and all the while enjoying for himself and bestowing upon others many comforts that he has not recognized in his account of profits and losses; but such comforts as others, who are engaged in different occupations, must purchase with money or fail to obtain.

Now take a young man, aged twenty-one, just entering the practice of the law. If he has no more to invest than the farm-boy had, he must inevitably fail from the start. But we will concede that he is educated, in the common sense of the word. Still, years must elapse before he will be as well prepared for his work as the farm-boy was for his simpler task. He has no experience. He may possibly have a few clients during his first year. They are not likely to be of the paying class. Men who have money are apt to seek well-known talent and experience in an advocate, when sacred rights are in peril. The young lawyer is dependent upon incalculable uncertainties. Still his expenses run on every day. He must pay for all he enjoys. His profession must board him, clothe him in style, rent and furnish his office, buy his books and fuel, pay all his sundry little bills, and defray his hotel and traveling expenses. How much clear gain will he probably have at the end of the first year of his professional labors?

He has been forced to make formal purchases of a number of things that the young farmer received regularly and without cost. Even after ten years have passed away, it is uncertain whether the average young lawyer will have a title to a home with as many conveniences and comforts as belong to the farmer's little possessions; and whether the said young lawyer will have a settled, trustworthy practice, that will meet his current wants and guarantee as much clear gain as the farmer had at the end of his tenth year. I am willing to concede that much has been gained by the lawyer in the way of reputation and experience. Granting all that can be reasonably claimed, the comparison is not discouraging to the farmer.

You may wish to consider the comparison, when the young farmer is educated as well as the young lawyer. In that instance the farming ought to be done more intelligently, and, in consequence, more profitably. There will be many more methods of making extra gains, realizing enjoyment, increasing reputation, and gaining pleasant and useful influence. Educated farmers are greatly needed to-day; not only on the farm, but in various public positions. This is repeated, that it may be duly appreciated. The farmer is not an exile or a monk. He is in the very throbbing center of society; and has a multitude of approaches to the masses around him, favorable to the enlargement of his own fortune and the improvement of their own condition.

The great truth is that so much does not depend on the character of one's occupation as upon the manner in which he pursues it. Signal success is achieved by the *few* only, in any department of human labor and enterprise. What are the principal reasons of this? While these reasons are numerous, and different in different cases, still we may mention, as one of the most prominent, the truth that so few are really and persistently faithful to the requirements of the work they have undertaken. History has made it an adage: "A sure reward to the faithful." We may add: success is impossible to the unfaithful. There is no effect without an adequate cause. There are no resultant advantages for those who have neglected the indispensable conditions. Nature is generous, society is often forbearing, and Providence is wondrously kind; but man must *work*, if he would *win*. Many fail, because they are not willing to pay the price of success. Many do not make, because they have not energy to labor, or self-denial to say *no* to unnecessary and expensive pleasures. Others make, but spend in foolish indulgence of self or others. Some follow costly habits of vice or fashion. Frequently one forms associations that are essentially baneful to his true interest in every respect. Keep your calling, and your calling will keep you. Be as loyal to your chosen sphere, as the worthy man is to the bride he has espoused. Let no vain influence come between you and your work.

"Let all the ends thou aims't at,
Be thy Country's, God's, and Truth's!"

A CUNNING DOG.

Dogs sometimes exhibit traits that are almost human; and we sometimes wonder whether Pythagoras was very far wrong in his theory that the souls of men at their death, and also before their creation, inhabit the bodies of animals.

Certainly, if so, the soul of a certain little black spaniel named "Nig" must originally have belonged to some greedy boy whose indulgent parents fed him upon knicknacks until he died, for never was there an animal more particular in his taste in regard to food. Many times Nig would go supperless to bed because his master insisted upon his eating plain bread and butter instead of cake; and he was known to fast an entire day on one occasion, because his breakfast consisted of fried potatoes and beef bones rather than hot rolls, of which he was extravagantly fond.

But little boys learn to get their own way, and little dogs are quite as apt.

After a time Nig concluded that the only sure method of obtaining what he wanted was to eat, or hide away what was given him and then beg for more; and, therefore, he would carry off the crusts which he found upon his plate, bury them at the foot of the garden and then return, and with wagging tail ask for a doughnut or a cookie, which he seldom failed to receive.

By this and other tricks the spaniel generally managed to secure such food as he best liked, and for a long time the shrewdness which he exhibited and the hearty laughs which he excited made his master forget how bad were the habits which he was forming. But one day Nig made too great a fuss about the supper which was placed before him, and, as a punishment, a severe order was issued:

The dog was to eat just what was left from the table and nothing more. What was good enough for the family must do for him.

That night Nig slept in happy unconsciousness of the new rule; but when morning came, and breakfast was over its full import became known to him. For his master had eaten codfish and potato, and codfish and potato was all that was left for master Nig.

A plate with the fishy food was prepared and placed in Nig's corner, and he was invited to partake. At first he approached with evident hunger and delight, sniffing eagerly at the offered plate; but when his nose told him what it contained his countenance and his tail both fell. He looked at his master in a reproachful manner and turned sadly away. He was called back and ordered to eat. Slowly he returned, but, instead of eating, he carefully pushed every particle of food from the plate to the floor, crowded it close under the rim of the dish, and again retired to a chair where he seated himself, looking soberly at the plate and then at his master as though entering a remonstrance against such a breakfast.

But his master was obdurate and spoke sternly:

"Nig, you must eat that fish and potato before you have anything else."

No sooner were the words spoken than the dog leaped from the chair, ran to the door, and disappeared.

For two entire days nothing was seen of him, and his master began to fear that the little fellow was lost, when early upon the morning of the third day Nig presented himself at the door and began to beg for his breakfast as usual.

Hoping that the dog's hunger had overcome his scruples, the fish and potato were again presented to him. He regarded it for a moment with a sorrowful air, ears and tail drooping low, and then quietly walked out of the door without tasting it.

This time he was gone nearly a week, and when, at last, he returned, his master succumbed. The obnoxious fish and potato were thrown away, and Nig fared sumptuously upon fresh beef and hot rolls.

Since that time the spaniel has eaten only such food as he prefers. Like many children he had fought the battle out and conquered.—*Wide Awake.*

WHY THE PEOPLE LAUGHED.

ALICE P. ADAMS.

It happened many years ago at Miss Crell's Floral Concert. The hall was gaily festooned with evergreens; all the girls wore white dresses and wreaths of flowers while the white trowsers of the boys were decorated with red stripes, and each hopeful fondly sported a necktie of the patriotic colors.

The entertainment opened with a duet by the King and Queen of the Floras, followed by a chorus in which all of the performers took part. The fresh young voices were well trained, and it was a pleasing sight to look upon the sprightly faces; many a mother's heart throbbed with pride as she singled out her blithe boy or gladsome girl from the others.

The last selection on the first half of the programme was a song by Annie Macleod. She was a wee little dot about six years old and her white dress was trimmed with sprays of periwinkle (or myrtle, as it is frequently called by the children.) She looked so cunning when she stepped out on the stage and made her diminutive bow that the people became very quiet, and listened intently that they might catch every word. This is the way her song began:

"There was a little maiden,
And she wore a little bonnet:
She had a little finger
With a little ring upon it."

She had sung these four lines, when, chancing to look down, she saw a great hornbug slowly crawling up her dress. (You have often seen them on a summer evening, children, flying about the room attracted by the light; and do you remember how they frightened you when you were small, and you begged papa to kill the "pinchbugs?")

When little Annie saw the beetle, she forgot about singing the next verse but screamed at the top of her voice, "Oo-oo-h! there's a bug on me!" and ran from the stage crying with fear and mortification at having "talked out loud."

How the folks did laugh! No studied witticism ever called forth such a torrent of hilarious mirth and applause in that old hall as this poor child's terrified exclamation. Very fortunate was it that the accident occurred just before the short intermission, as it would have been impossible for that audience to sit quietly in their seats and listen gravely to a ballad without an opportunity for getting rid of some of their jollity.

When the commotion had partially subsided there were calls for "Annie Macleod!" and "the rest of that song!" Miss Crell then appeared on the stage, and waiting till all was quiet, informed the assemblage that little Annie had been taken home, and said they would proceed with the programme without further delay.

But during the remainder of the entertainment more than one with difficulty repressed a laugh as he recalled the child's consternation and ludicrous outcry when she discovered the intruder.

A few days later, the weekly paper contained a notice of the concert, which ended thus: "But we consider little Annie Macleod's song and *speech* the happiest effort of the evening."

THE HORTICULTURAL CLUB.

It has given me much pleasure to be able to send to each member of the club, except to those who have recently won prizes, a Gladiolus bulb, which I hope will have been safely received by the time they read this. The bulbs were some that could be spared from the Rural Grounds, and I could think of no better way to dispose of them than to distribute them among my young friends.

We commonly call the Gladiolus a "bulb," but, speaking more strictly in accordance with the definition given in botanies, it is a "corm" or solid bulb; that is, a fleshy, underground stem, of a rounded or oval form, and a compact texture. The real bulb consists of layers or scales, like the Onion and the Lily. If you will compare one of these with the Gladiolus you can readily see the difference.

The Gladiolus is a tender plant, and the bulbs should therefore not be set in the open ground till about the middle of May. Each bulb sends up a stem two feet high, which, in August, bears a spike of six to twelve large flowers of the most brilliant colors imaginable, from dazzling scarlet and orange, through all intermediate shades to almost white, though there are none of a pure white or of a bright, unspotted yellow. A scarlet or orange ground, splashed and spotted with some other tints, is the most common. The bulbs should be set six to nine inches apart, in rich, mellow, garden soil, and five or six inches deep. When the stem is ten inches high it should be tied to a neat stick to prevent the wind from blowing it over. In the fall, before frost, the bulbs are taken up, dried for some days in the sun, the tops cut off and the bulbs kept in a warm, dry place during the winter. UNCLE MARK.

LETTERS FROM BOYS AND GIRLS.

DEAR UNCLE MARK:—The seeds came all right, and I am very much pleased with them. Will you tell me 1st, what is Mentzella ornata? 2d. Is the "Rose of Sharon" really a rose? 3d. Should the Hollyhocks have a rich ground, and how deep should I plant them? 4th. Are the Aquilegias hardy?

I had an asparagus bed last year, and sold the asparagus at the village; I made $6.50 out of that. Father intends to plant a larger one this year.

Please put my name on the list of your Horticultural Club. Your young friend,

MABEL C. HOSKINS.

ANS.—1. Mentzella ornata is an ornamental, perennial, flowering plant. It bears large, white, fragrant flowers, that open only at sunset or on a cloudy afternoon. The flower has ten petals arranged in two circles, the inner petals narrower than those in the outer circle, and a great many—200 to 300 stamens. 2. No, it is not a rose, but a very handsome shrub, that in late summer bears large, rose-colored flowers; the botanical name is Hibiscus Syriacus. 3. The Hollyhocks will give you the best satisfaction in a rich soil. Cover the seed about half an inch. It will not flower the first summer, and can therefore be grown in a nursery bed till next spring, when it should be planted where it is desired to bloom. 4. Yes.

DEAR UNCLE MARK AND RURAL COUSINS:—I would like to join the Horticultural Club, as I have had a little experience in gardening. To begin with, I am ten years old, and I want to tell you what I did last summer. My father gave me a small place that had been used for a pig pen. I spaded it myself, planted radishes, onions, cabbages, lettuce, etc. My mother told me if I could make enough out of my garden I might subscribe for a paper. So I began in good earnest. My radishes came on very soon; I tied them in small bunches of ten or twelve in each bunch, and took them to the nearest town, where they sold for from four to five cents per bunch. Next came my lettuce, onions and cabbages; to be sure I did not realize a large price for them, but as I worked in my little garden nights and mornings, and did not neglect my school duties, I made enough to enable me to take the dear RURAL this summer. Father has given me a different piece of ground to work this year. It is twenty-four feet long and twenty-two feet wide. Now, dear Uncle Mark, if I see this in print, I will tell you from time to time how I am getting along with my garden. I shall always love your dear paper and work for its interest.

Lucas Co., O. WALTER C. GAYHART.

Sabbath Reading.

NEED OF MORAL DISCERNMENT TO APPREHEND GOSPEL TRUTHS.

The great truths of the Gospel require for their apprehension some moral discernment. How can a thoroughly selfish man understand the truth of Christ's divinity? Divinity to him means force or quantity rather than quality of being. How much would you know about the Apollo Belvidere if one should simply tell you that it consisted of so many cubic inches of white marble, and weighed so many pounds? What idea of its beauty would those words convey to you? Some such quantitative notion of Christ's divinity a selfish man may get, and it is the only idea of him that we find in the writings of many theologians. Such a notion may well be disputed about, but it is of no practical value. To apprehend the beauty of Christ's character, in which His divinity chiefly resides, one needs much schooling in the services of obedience and love. And the more men know of this the less they will be inclined to dispute about it.

Christ is our example; but he who supposes that Christ's work consists simply in furnishing us an example has a very inadequate idea of what man needs and of what Christ is. It is true that we have some power of copying, by observation and volition, the conduct of those that are better than we are; but it is also true that the lives which are mainly the result of imitation are defective and unlovely lives. "That peculiar character," says Dr. Mozley, "which we admire in another, would become quite a different one in ourselves could we achieve the most successful imitation. The copy could never have the spirit of the original, because it would want the natural root upon which the original grew. We ought to grow out of our own roots; our own inherent propriety of constitution is the best nucleus for our own formation." This, then, is what we need—the healing, the quickening, the replenishing of our spiritual life. It is not a model to grow by; it is "more life and fuller that we want." That is what Christ came to bring: "I am come that they might have life, and that they might have it more abundantly." By faith in Him we are made partakers of His nature, and thus the very elements of virtue in us are reinforced. The tulip bulb does not need a full grown tulip to look at that it may learn how to blossom; it needs to feel at its own heart the warmth of the sun and the moisture of the soil. Not Christ before you as an example, but "Christ *in* you," communicating to you the vitalizing energy of His own eternal life, is the power of God unto salvation.—*Sunday Afternoon.*

WHEN JESUS COMES.

There is one very sweet sense in which "Jesus comes" to His own followers in these days. He does not come in fleshy form, as He did eighteen centuries ago; nor does He come amid clouds and celestial splendor, as He will at the final judgment. But in spirit, seen by the eye of faith, Jesus draws delightfully near to those who seek for His presence. He comes to the awakened penitent, who cries out to Him: "Come and take away my stony heart, and make it a heart of flesh." Already you may hear His knock at your heart, and His loving voice: "If thou wilt open the door, I will come in unto thee and sup with thee, and thou with me."

Hasten to let Him in! He will not be satisfied with a closet or a corner of your heart, or with a paltry share of your thoughts, grudgingly given. He wants every room—your faculties, affections, and will, must all be surrendered to Him. The key of your purse must be His, too. Don't plead that you are not worthy that He should come under your roof. He loves to stoop to the lowly in spirit. He will bring His own entertainment with Him when He "sups" with you. You will be fed with more than angels' food when the King sitteth at the table. This is the very essence of conversion; to turn sin out of the door and convert your heart into a dwelling-place for the sinner's friend.

"Admit Him, for the the human breast
Ne'er entertained so kind a guest;
Admit Him, and you won't expel,
For where He comes, He comes to dwell."

The richest and most joyous hours in a believer's experience are those in which he tasted of Christ's presence in close spiritual communion. The believer feels the warmth and the light of His countenance. His left hand is under our head, and His right hand doth embrace us. We can roll off our cares and worries and doubts upon His everlasting arm. Such times of close companionship with Jesus are our holiest and happiest hours this side of heaven.

Into sick rooms where His children lie, Jesus often comes. No physician visits so faithfully. Noble old Halyburton, of Scotland, said one morning to his family; "Jesus came to me in the third watch of last night, walking upon the waters. He said to me, 'I am Alpha and Omega, the beginning and the end, and I have the keys of hell and death.' He stilled the storm in my soul, and lo! there was a sweet calm!"

When Jesus comes in the house of sorrow, He speaks the same wonderous words which He spake to the mourners at Bethany. He allowed death to come there first to make ready for His own coming. Is not this one reason why death is allowed to take our loved ones? Then we are ready to send for Jesus!—*Southwestern Presbyterian.*

PERSONAL ITEMS.

Bishop Edward R. Ames, of the Methodist Episcopal Church, died in Baltimore last week, at the age of 73. He was born at Amesville, O., and graduated at the University of Ohio, in Athens. He was elected bishop in 1852. He was noted for his executive ability.

Gen. Butler offers 20,000 acres of land in Wisconsin to the negroes fleeing from the South, to be divided up into small farms, and Bob Ingersoll will lecture on the exodus to raise money to help the colored people to accept the offer. A Philadelphia Quaker chips in $10,000 to assist the sufferers to settle in the West.

Mark Gray, a stage-struck, half crazy fellow, tried to shoot Edwin Booth while he was acting in McVicker's theater at Chicago last week, but his bullet went aside of the mark. Gray says Booth had injured a friend of his and that his act was one of vengeance, but he is obviously insane.

Princess Christina, infanta of Spain, died at Seville last week. She was the second daughter of the Duke de Montpensier by his wife, the Infanta of Spain, Marie Louise Ferdinand, was born at Seville, October 29, 1852. She was a sister of the late Queen Mercedes, and of the Princess Marie Isabelle, the wife of Count de Paris.

H. J. Jewett, president of the Erie railway, has a salary of $40,000 a year; Tom Scott, president of seven railroads, draws $100,000 salary, $24,000 from the Pennsylvania road alone; J. W. Garrett, president of the Baltimore and Ohio, has a nominal salary of $4,000 a year. There are to-day 15 general managers of railways in the United States, whose salaries run from $10,000 to $15,000; nine general superintendents, with a salary of $7,000 to $10,000 yearly, and a number of officers in the same rank who receive over $8,000 apiece.

MIDDLETOWN, CONN., and Nos. 199 and 201 Wabash Avenue, CHICAGO, ILL.

Wit and Humor.

A LITTLE girl where a minister had been invited to dinner, was privately placed on her good behavior. Finding a lull in the conversation at the tea table, she folded her hands and said, "O God, please pass the butter."

"MAMMA, I don't think the people who make dolls are very pious people," said a little girl to her mother, one day. "Why not, my child?" "Because you can never make them kneel. I always have to lay my doll down on her stomach to say her prayers."

A SCHOOLMISTRESS, while taking down the names and ages of her pupils and the names of their parents at the beginning of the term, asked one little fellow, "What's your father's name?" "Oh, you needn't take down his name; he's too old to go to school to a woman," was the reply.

WHEN Oxford University conferred on Longfellow the degree of D. C. L., an under-graduate called out for "three cheers for the red man of the West." Which goes along with a story the late Thomas Corwin, a member of President Fillmore's Cabinet, used to tell of himself. At an English reception given in his honor, an elegant lady kindly inquired of the rather dark-complexioned American: "Is your tribe at peace with the whites?"

A MAN who married a scold witnessed the play of "Taming of the Shrew" the other night for the first time. He went home full of inward chuckles, and mentally resolved that he would also embark in the "taming" business before the sun again glided the western horizon. So the next morning he procured a cart-whip and when his wife ordered him to take his feet off the mantel-piece, he snapped the whip defiantly, smashed a coffee pot, a sugar bowl, a dollar pitcher and two plates, and—and that was all. He says Shakespeare was a colossal fraud, and he is is glad he is dead.—*Norristown Herald.*

Stimulate the Sluggish Kidneys.

In addition to its tonic and cathartic properties, Hostetter's Stomach Bitters exercises a beneficial influence upon the kidneys and bladder, when they are inactive, by stimulating them to renewed exertion, thus reopening, as it were, a sluice for the escape of impurities whose regular channel of exit is the organs of urination. Among these are certain abnormal and inflammatory elements, productive or irreparable injury to the system if not entirely expelled. The kidneys and bladder themselves are also benefited by this stimulus, as their inactivity is usually a preliminary to their disease and disorganization. They also experience, in common with other portions of the system, the potent invigorative effects of the Bitters, which furthermore corrects disordered conditions of the stomach, bowels and liver.

We know Hop Bitters are above and beyond all as a nutritious tonic an curative.

WEATHER VANES

Manufactured by
HARRIS & CO.,
54 Bromfield St., Boston, Mass.

A GOOD SAW-MILL for $188.

Our No. 1 Plantation Saw-Mill is designed to be run by 8, 10 or 12 horse-power Agricultural Engines. With this power from

1,500 to 4,000 Feet

of lumber can be cut in a day; a product 25 to 50 per cent. greater than can be cut with any reciprocating saw-mill. The mills are complete, except saw, and will be put on the cars in Cincinnati for the low price of $188, and warranted in every particular. Saw-Mills of all sizes, Engines and Boilers, Shafting, Gearing, etc. Illustrated Circulars sent free.

DESIGNS OF A COUNTRY HOUSE.

Now that the building season is at hand we give to our readers another original plan of a handsome country house designed by our artist, L. F. Graether, C. E. The description of the plan is as follows:

FIRST STORY: A, plazza; B, balconies; C, vestibule; D, hall, with main flight of stairs; E, library, 10x15 feet, with bay window, a; F, F, bed-rooms, 15x20, and 12x15 feet: G. parlor, 15x15 feet; H, dining-room, 15x30 feet, with bay window, a; I, kitchen, 12x15 feet; K, back stairs to servants' bed-room; L, pantry, 10x15 feet; M, passage-way from dining-room to kitchen with wash-stand and drawers; N, N; closets. An open arch between C and D, is marked by dotted lines.

SECOND STORY: A, represents the hall; B, balconies; C, C, bed-rooms; D, servants' bed-room; E, bath-room and water-closet; H, sky-light; N, N, closets. As will be seen, there are open fire-places in E, F, G and also in H and I. The design of the elevation is readily intelligible on comparing it with plans.

Just a few hints to those who intend building homes the present season. Before deciding on a plan take the ladies of the household into council. It is they who will have the chief control of the dwelling-house and upon whom its comfort will mainly depend, and it is but proper therefore that their opinion should have due weight in deciding upon its situation, surroundings, and especially on its internal arrangement. Mature your plans carefully so that no subsequent alterations will be rendered necessary through errors in the original design, for by such changes the contract with the builder is broken and the door thrown wide open to charges for "extras," than which few things are more unsatisfactory, however trifling they may be. The best time for examining the proposed site of the building is in the worst kind of weather; for its faults are then most obtrusive, while whatever advantages it may possess at such a season, will be certainly increased under more favorable conditions. While a house crowning an elevation commands the widest prospect, and would therefore be in the best position, if picturesqueness of view alone is to be considered, yet as it would thereby be exposed to high winds, and dashing rains and all inclemencies of the weather, while its approach would always be difficult, a less conspicuous position is generally preferable. A situation of moderate elevation, however, admits of easy drainage both of sewerage and surface water, and while free from the disadvantages of lofty position, is also exempt from the malaria and other frequent annoyances of a low or level site.

If the building fronts towards the southeast, the most pleasantly sunny aspect is generally secured. Care should also be taken to so place it as to command the finest view in the neighborhood, when other conditions will permit, and thus enjoy a perennial source of pleasure and

refinement. A heavy, tenacious clay should be by all means avoided, as on such a foundation it is almost impossible to keep the house dry unless at a heavy expense. A gravelly soil is the best site, but whatever the nature of the place chosen, thorough drainage is essential. A house built near the road is made cheerful by the passing travel, but there are other considerations that often should outweigh this. There is a vulgar boldness in the position of a house pitched close to the road and obtruding itself on the notice of the passers-by. While large trees close to the house are insalubrious, a background of trees and shrubbery is desirable.

RURAL RESIDENCE.—Elevation.

FAULTY PROPOSITIONS IN REGARD TO BARN BUILDING.

CHARLES E. VERNIER.

IN the RURAL of February 15th, was an article entitled, "A few axioms in barn building." The propositions which are stated in the first and second axioms as general and self-evident truths, are true only when certain conditions exist. For fear that the so-called axioms may be taken for what they are represented, I will proceed to point out the errors involved in them:

The First Axiom

was as follows: "Money is saved by increasing the contents perpendicularly (vertically) not horizontally. "Let Fig. 1, (page 310) be an end section of frame with posts 13 feet high—the statement is then made that if the hight is doubled, the capacity is doubled without a corresponding increase of expense. It is evident as he says, that no extra expense for roofing will be required, and he apparently assumes—otherwise his proposition could not be true—that the cost of framing is directly proportional to the hight; that is, that it will simply cost twice as much to construct a barn-frame 26 feet high as to construct one 13 feet high. Now, a very little study of the experiments made regarding the strength of materials, and of the mechanics of framing, would have shown him that to construct a barn frame 26 feet high equally as strong as one 13 feet high, would have taken for all upright pieces, *nearly four times as much material.* The labor of constructing the upper 13 feet is much in excess of that of building the lower 13 feet, so that in practice the cost of the vertical pieces of a barn frame 26 feet high, is four times the cost of those in one 13 feet high. Then, it is found that the breaking load on the end of a post 13 feet high and 5 inches square, is 11.4 tons, while that of a post 26 feet high and 5 inches square is but 3.4 tons.

It is thus seen that his proposition which he calls "a self-evident truth," is not true at all, unless a man can build the vertical portions of three barn frames cheaper than he can one roof. That he can do this, as a general thing, I do not doubt, especially when the hights are not excessive; but in accordance with the axiom, a barn a mile high would be cheaper than one a mile long, of the same capacity, whereas the fact is, that the cost of the timber increases much faster than the hight, and in a short time is sufficient to overbalance the saving from less roof. In regard to

The Second Axiom

that it pays to build one barn rather than several covering the same space, I would say, that so far as the mere question of economical construction is concerned, *this is seldom true.* In this axiom, as in the other, the important fact is overlooked that large structures are more weak relatively than small ones, and that much heavier timber must be used in them. In this case, there is a saving in the siding, as stated; but there is a great loss in the timber for the frame.

Let Fig. 2 (p. 310) represent a barn-frame, equal in width to two smaller barns, shown by dotted lines; if the frames are

in every respect similar (except as to hight of posts), it will be seen that the span of roof and length of horizontal beams in the larger frame, are just twice the length of those in the smaller one. Now, under such conditions, an equal load, similarly placed, produces four times the strain on the roof timbers and horizontal pieces subjected to downward pressure in the frame of the larger barn that it does on those of the smaller. The result is, that to make the frames of equal strength, the roof timbers and most of the horizontal timbers, must be four times as large in the larger frame as in the smaller one. Now, whenever the saving on siding and eave projections is sufficient to pay three times the cost of the timber previously mentioned, then will there be economy in converting two small barns into one large one. It is to be noticed that so long as the pitch remains the same, the amount of shingles and roof boarding required is unchanged, whether the space be covered by one or any number of roofs. Thus, in Fig. 2, the distance a d f is equal to the distance a b c e f.

As a *general* thing (with some exceptions), so far as economy of structure covering an equal area is concerned, those buildings having the most roofs, are the most economical to construct. An example of this is seen in bridge building, where it has long been known that two structures of 20 feet each (not considering the abutments) can be erected for about one-half the cost of one structure, 40 feet long, of the same width and strength. The conclusion in regard to what the writer terms his second axiom, is that it is of extremely limited application and true only when the cost of siding makes up a large proportion of the expense of building the barn. The most economical size of any barn for a given capacity can be determined only by knowing the cost of material and labor in any given locality. This much will usually be found true in any locality, that the most economical means for providing a given capacity will be found in buildings with a moderate hight and a moderate span of roof rather than in a less number of larger buildings, or in a greater number of smaller ones. The length of a building may be increased indefinitely, provided the hight of the building and the span of the roof are unchanged, without increasing the strain on the timbers of the frame, except very slightly at the end, and consequently by such an operation there is a saving of siding at the ends with no counterbalancing expense. Thus, in Fig. 3, A B H G represents the plan of a barn formed by putting the ends of the barns A B D C, D C E F and E F H G together, and this is the only way in which a barn can be indefinitely extended without incurring an expense far out of proportion to the benefits received. It is hardly necessary to say that, as a general thing, our conclusions sustain the common practice of erecting moderate-sized barns as more economical than larger ones.

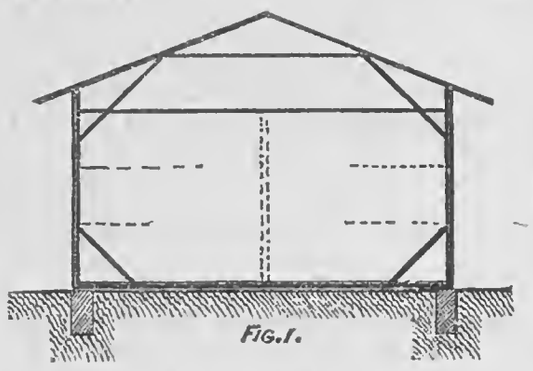

FIG. 1.

Practice in England.

In England the high price of material has made the question regarding the economy of barn buildings a live one, and we find that considerations, both of economy and convenience, are leading them to construct barns of moderate hight and moderate span of roof, but in effect of considerable length by constructing them around an open yard, or by constructing a series of small barns, side by side, with seperate roofs, as shown by the dotted lines a b c e f in Fig. 2.

Fig. 4 shows the plan of a barn actually built on the farm of Thomas Magraw, near Bay City, Mich. The part inclosed with double lines, is the main building, the portions in single lines make up a shed for horses and cattle. Though this is not presented as a model barn plan, either for convenience or economy, it is believed a careful study of it will do much good. This barn, it is claimed, is built after German models; it certainly was erected by an intelligent German, and shows unusual compactness and economy of construction.

The Other Axioms.

Of the remaining propositions stated under the head of axioms, three, four and five are open to little objection. [Briefly these are as follows: third, "The barn floor should run crosswise not lengthwise of the barn;" fourth, "It is economy to utilize the space covered by the roof, and therefore the whole basement should be inclosed;" fifth, "We should make the force of gravitation work for and not against us, and therefore by constructing a bank barn, so arrange that the load should be pitched down rather than lifted up."—EDS.] Axioms four and five contain much excellent advice. I feel, however, like entering a protest against the use of the word "axiom" in such a sense. Even though the propositions involved were general truths—which they are not—the very fact that argument is used to establish them proves them not self-evident, and hence not axioms.

Lansing, Mich.

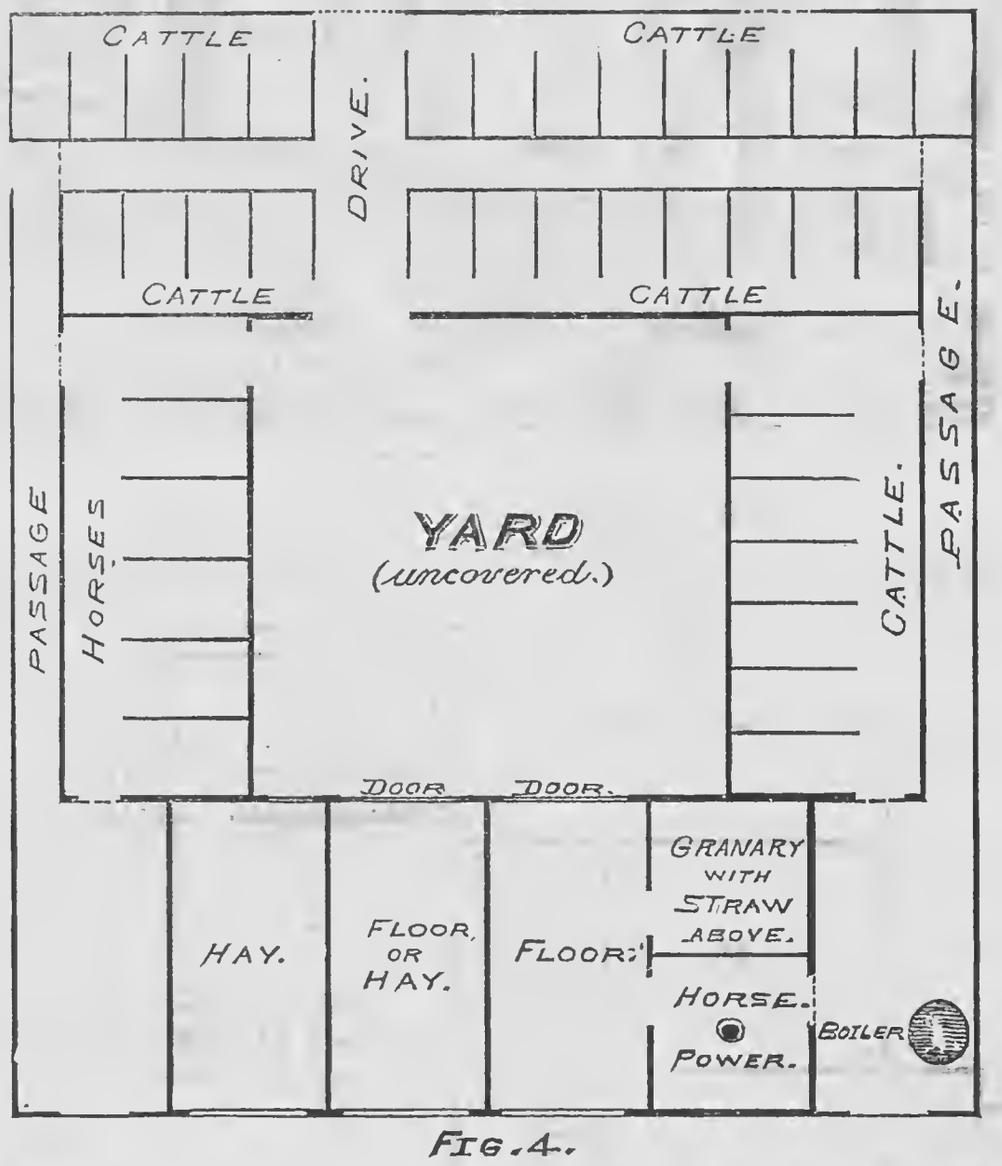

FIG. 4.

Field Crops.

HISTORY OF A POOR FARM—NO. 9.

The Value of Roots and How to Grow Them.

"WHAT has made English agriculture the most productive in the world," remarked Mr. Martin; "if it is not the root crops? No other nation, unless it be the French, give so much attention to roots. This crop occurs in the rotation as a regular member of it, and it is regarded as the chief source of manure. It is either fed off from the ground by sheep penned or hurdled upon the fields in plots in regular succession, or it is carted to the feeding sheds where fattening bullocks are kept amply littered with straw, and is given to these at the rate of one or two bushels per day along with various concentrated foods. This is done for the purpose of making the large supply of manure without which the tenant farmers could not pay the high rents charged for the use of the land. Mr. Mechi makes 200 pounds of beef or mutton per acre every year for every acre of his farm, besides selling butter, grain, hay and vegetables. Two hundred pounds of beef or mutton are equivalent to $30 per acre and this is from a secondary portion only of the product of his farm, which is worked under a system which they call high farming."

"Mr. Mechi is a rich man and farms for pleasure, I suppose?" said my old neighbor.

That is a mistake" I replied. "Mr. Mechi was formerly a very successful business man, and purchased his farm, which was as poor as mine, and worse in fact, because it was a hard, sterile clay fit only to make bricks of, wet, cold and unproductive. It cost him about $125 per acre when fair farming land in England was worth $500. I saw the farm some years ago before it was wholly underdrained or broken up—"smashed," is the term used—by steam cultivation; and then the hard clay rang under a person's tread almost like a burned tile, and there were deep cracks in the bare fallows, two inches wide; since then Mr. Mechi's business has suffered from disaster, and he is now a poor man, compared with what he once was, and depends for his daily bread upon the profits of his farm. The history of his farm, is decidedly, a "history of a poor farm;" but there are few others in England or elsewhere that can now show a better yearly account than his. Friend Martin is right. Without roots Mr. Mechi would never have succeeded, and I hope to profit from his success."

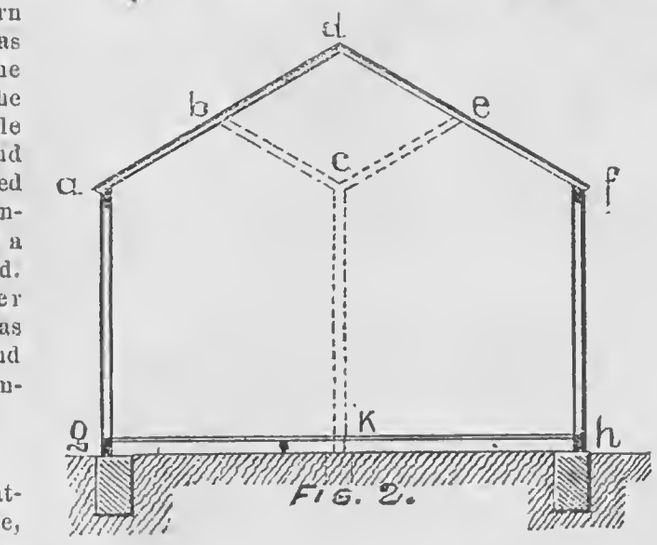

FIG. 2.

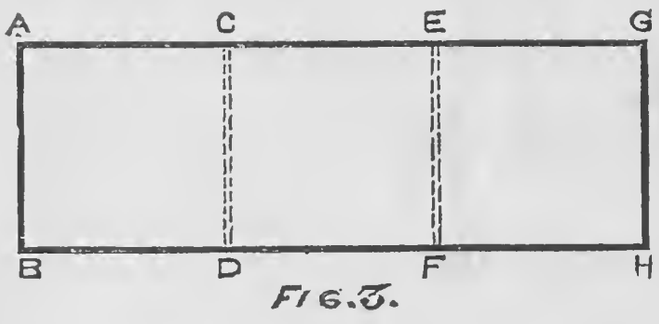

FIG. 3.

"If we grow roots, we can't grow corn; and how can we do without corn?" remarked the old gentleman. "Corn is our great crop. It fattens nearly all our beef, and makes all the pork, poultry, and eggs we raise, and corn can be grown with less trouble than roots. I never grew a crop of turnips that paid me."

"That is because you sow them broad-cast and never weed them," replied Fred.

"It would not pay to weed them; the labor would come to more than the crop, if we hired it, and we have not time to do it ourselves. Half a crop raised cheaply is better than a dear full crop" rejoined the old gentleman. "Corn is our grand crop, and it feeds everything."

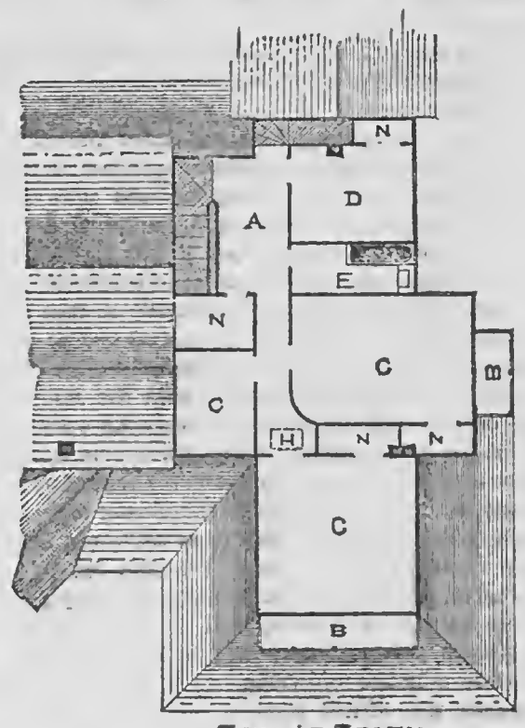
"You are very wrong to suppose that half a crop raised cheaply, is better than a full dear crop. That is contrary to general experience and is a baneful idea. But you are right as regards corn." "It is a grand crop," replied Mr. Martin; "1,342,558,000 bushels raised in one year, or over 30 bushels for every man, woman and child in the country, is something vast to think of. But you do not think of how much of this is wasted by not being fed as profitably as it might be. There is no need to grow one bushel of corn less than we do, should we grow roots. The two crops can be grown and used together. We cannot feed all corn; we need some succulent food to preserve healthfulness. It is highly probable that nearly all the fatal diseases of our stock—hog cholera as it is called, for one—are due to feeding corn, and corn only. With soft, laxative food, such as roots, I believe these diseases would disappear. Besides, we can't grow a crop of roots successfully without killing an enormous quantity of weeds, and that is a benefit."

"I don't see how we are to do it; where would you put your roots?" asked the old gentleman.

"On the oat stubble, grandfather," replied Fred; "instead of wheat or rye. A good crop of turnips was grown on the college farm after the oats were taken off, and barley was sown in the spring and seeded down to grass and clover. We had 960 bushels of turnips per acre; the ground had 10 loads of manure per acre and 300 pounds of superphosphate of lime, and we had 48 bushels of barley to the acre the next year, and a fine catch of grass. You see the turnips were nearly all clear gain."

"And the rag-weed did not seed in the oat stubble, I dare say," remarked William.

"That it did not," I replied, "if the turnips brought nearly 1,000 bushels per acre. But I consider turnips only a catch crop to fill a gap such as this. I agree with Mr. Martin that we can and should grow roots in our regular rotation. Put corn on the sod, if you like,—although I don't consider that necessary and would just as soon put it on stubble land,—then take oats or barley; fall-fallow the land, which I think an admirable practice, and grow mangels or sugar-beets, using as much manure as can be spared, and at least 500 pounds per acre of artificial manure. From 1,000 to 1,200 bushels per acre may be expected, if the seed is put in early and the crop is well cultivated and the season is not very unfavorable. The next season you have a clean field which is well prepared for barley, and no other crop is so good a one as this to seed down to clover with. Then the second year the clover may be turnedunder for wheat with a light manuring and some superphosphate, if possible, and the ground seeded to timothy and clover for two or three years' hay. This would give an eight-years' rotation in place of six now, or seven, if turnips are taken after oats, instead of waiting for mangels the next spring. There would be three manurings, two cultivated crops and two smothering crops—grass and clover—by which weeds would be kept down. The feeding of the roots would make a large quantity of manure which would be useful for potatoes or corn the next season. This would be my plan if I were farming in this way; but as I am situated, roots are a positive necessity. I must have green winter feed to produce milk. Turnips will not do on account of the disagreeable flavor they give to the milk. Beets and mangels are free from this objection. Last year on one acre, as an experiment, I raised 1,200 bushels at a cost of five cents a bushel. This year I am sowing five acres which, I hope, will at least produce 4,000 to 5,000 bushels.



FOR DESCRIPTION SEE FIRST PAGE.

For 25 cows, which I expect to feed next winter, these will last 200 days or six months, at one bushel per head per day. I do not know of any other crop which will feed so many cows, for so long, from five acres, as this. With one bushel of beets or mangels and three quarts of feed, I should hope for as much milk as from six quarts of feed and three quarts of malt sprouts, at a saving in cost of about 10 cents per head each day, and more than that including the hay saved. But while roots are invaluable for a dairy farm, they are equally indispensable for every other farm upon which it is requisite to make manure; and I don't know where the farm is where this is not required."

"There is no doubt of it," rejoined Mr. Martin, "and the great point is to have the right kinds, and grow them in the right manner. With such a large choice it is difficult to determine which is the best."

"The best is not always the biggest, nor the most prolific. I am now sowing several different kinds—the Mammoth Red, the Red Globe, the Yellow Globe, the Yellow-fleshed Tankard, and Webb's Intermediate mangels, with Lane's Improved sugar-beet, the common white sugar-beet, Vilmorin's Improved French sugar-beet, Landreth's Improved rutabaga, and the Early Blood turnip beet. Of these hereafter I shall

choose the best, which I expect will be the Blood beets, Lane's sugar-beet and the Yellow-fleshed mangels, coming into use in the order named from September up to April or May. This will give a long season and some very valuable feeding."

"You had some mangels last year that weighed 24 pounds each, but there was no substance in them; they seemed to be nearly all water. A bushel of those would be cold feed for cows, I think," remarked the old man.

"Twenty-four pounds is an excessive weight," I replied. "A full crop of such beets in rows three feet apart and two feet apart in the rows, would amount to 84 tons per acre. That is an unheard of yield, and although a few roots may reach that size, the majority are smaller, weighing eight to twelve pounds. I aim to grow roots of six to eight pounds each, in rows three feet apart and eighteen inches in the row. If there is not more than one-fourth of the spaces vacant, the yield will be nearly 30 tons, or 1,000 bushels, per acre, and these roots will be solid, yet contain perhaps 95 per cent. of water. A bushel of them will contain 57 pounds, or nearly seven gallons of water. But water is food, and goes to nourish the system of an animal which consists of 75 per cent. of water, and I don't know of any better way of giving seven gallons of water of a cold winter's day than in a warm barn, and in roots comparatively warm from a cellar. It is certainly better than giving the water from a trough about which the ice is several inches thick, or from the creek through a hole cut in the ice. There is much less cold for the stomach to neutralize."

TOBACCO CULTURE.—No. 2.

G. GOFF, JR.

In preparing soil for tobacco, it should be remembered that there is, perhaps, no crop on the farm that will so well repay a thorough and careful preparation, and that a fertile and well prepared soil is essential to the production of a good quality of leaf.

When the soil has been properly prepared by being well manured, plowed twice, and thoroughly pulverized by the use of the harrow and roller, it is marked one way, in rows three feet and a half apart, with a common corn marker. In old times the plants were set on a hill or "spat" made with a hoe; but the method followed by most growers at present is as follows: A ridge is formed along each mark with a plow or cultivator. The Alden thill cultivator is in more general use hereabouts than any other, the outside teeth only being used. These are so placed as to move the earth inward, thus forming the ridge. These ridges are then passed over with a light roller, on the outside of which are fastened small cleats which serve to mark the points where the plants are to be set. The roller commonly used for this purpose is made in two parts, each two feet in length and about the same in diameter. These are hung in a frame far enough apart so that two ridges may be rolled at once. Thills are attached to the center of the frame so that the horse may walk between the rows. The plants should be set about 20 inches apart in a row. The rollers, therefore, should be about five feet in circumference, having three cleats fastened at equal distances.

The best time for setting the plants is considered by growers here to be during the first two weeks of June. Nothing is gained by setting small, weak plants. They should remain in the seed-bed until the proper size for setting. They should be set immediately after a rain while the soil is wet. Boys are usually employed for this work, and are paid by the hour. One boy goes ahead and drops a plant at each mark made by the cleats in the rollers, and others follow and set them. One boy can drop enough for two to set. Care should be taken in setting the plants to have the roots set in straight. If the soil is hard or stony, a dibble is useful in making the hole for the plant. Where the soil is mellow and free from stones, the finger is the only dibble that is needed. The droppers are instructed to drop occasionally an extra plant. These extras will be needed to fill vacancies later in the season. The seed-bed should be heavily sprinkled with water before commencing to pull the plants, so that the roots will not be injured. If a little dirt sticks to the roots, they are more likely to grow and do well. The cut-worms sometimes do considerable damage by eating off the plant at the surface of the ground. When they are troublesome, they should be hunted for and destroyed. The morning is the best time for this work, as at that time they are usually found on, or near, the top of the ground. The tobacco field should be gone over frequently and plants from the seed-bed set in wherever any are found lacking. It is well to have plenty of plants left in the bed for this purpose.

Tobacco is at best a risky crop. When a good quality of leaf can be produced, it generally commands a ready sale at a price that will be profitable to the grower. But good crops cannot always be grown, even by the best planters, as much depends on "wind and weather." A single hail-storm will sometimes nearly destroy a whole crop, and a heavy wind will often cause much damage. Tobacco-growing is a trade in itself. There are things about it that can only be learned by experience. In order, to avoid serious mistakes it would be well for those intending to begin tobacco-growing to employ some reliable man who has had experience in the business, to oversee the work, so that it may be done correctly.

Chemung Co., N. Y.

Early-Cut Hay.—It is not too soon to consider this subject and to prepare for it. In this country especially, when prairie hay is cut in September and October, it has become too ripe for milch cows during winter. For several years I have cut a few tons very early, say in June, put it up as green as it is safe to do so, and begun to feed it out in December. The flow of milk is promptly increased and kept up as long as the hay lasts. When this hay "gave out" some time back, there was a loss in the quantity as well as in the quality of the milk—a strong proof of the value of early-cut hay for this purpose. S. R. M.

Horticultural.

NOTES FROM THE RURAL GROUNDS.

Picea Pichta (Abies Sibirica).

We wish to call the especial attention of all interested in Arboriculture, as confined to ornamental grounds, to this evergreen. It comes from the Siberian mountains where it is said to be found at an elevation of from two to five thousand feet, forming entire forests and growing to the hight of from 25 to 50 feet. Its leaves are of the darkest and average nearly two inches in length. It bears a general resemblance to the Balsam Fir and to the European Silver Fir, of which latter it was thought by Don a variety. But it is very distinct. The leaf arrangement is different; the leaves are thicker, more curving and less silvery underneath. The habit is more compact and, what is of more consequence, indeed, of the utmost consequence, it is not only hardier than either, but it is one of the hardiest evergreens among our collection. We have yet to notice that a single twig or even leaf, has ever been injured either by the severities of winter or the heat of summer, and we beg to remind our readers that our situation, being in a valley open to the north, and ten miles from any considerable body of water, gives a very trustworthy test of a plant's powers of endurance. For instance, the Norway Spruce is here often severely injured. The Silver Fir is always injured more or less, and Balsam Firs, ten years old, in neighboring grounds, have had their lower foliage so scorched by the past winter as to hasten the loss of the lower branches which, in the fine specimens to which we refer, would probably yet have remained for several years. The Nordmann's Fir, too, is here so often scorched that it never can develop the beauty and grandeur which belong to it under less trying circumstances. People who have given little thought to the subject, upon being called upon to select trees for their homes, almost invariably choose the Norway Spruce, the Balsam Fir, the Arbor-vitæ and perhaps, the Common or Irish Juniper. This would have been well enough ten years ago; but now such a selection would surely prove a cause of regret in the not distant future. The same as the newer varieties of fruits have in numberless cases taken the place of the old, so new and well tested kinds of evergreens of unquestionable superiority, are supplanting those we have just mentioned. As within the past two or three years we have said all we could to make known the value of scores of new plants as well for the farm as for the vegetable and flower garden, so now we press upon the attention of our readers the comparatively new evergreen Picea Pichta, as promising to take a foremost place among the evergreens of the future with which our tastiest grounds will be adorned.

Magnolia Lennei.

Soulange's and Lenné's Magnolias are now, May 5, in bloom at the Rural Grounds. The first has always been considered about the best of the foreign Magnolias, but this can no longer be said now that we have Lenné's which, as to hardiness,—the only respect in which we feared it might prove inferior,—has now been well tested. In every other respect it is the equal of Soulange's and in one, its superior, viz., in the color of its flowers. These are a dark reddish-purple outside and nearly white within. As we write this note, we count upon a tree before us, only five feet in hight, fifty flowers, more or less opened, while half as many buds have still to unfold. These flowers bear nine petals about four inches long, of a balloon shape. When fully developed, the flowers are about six inches across. The reader may judge for himself how showy even so small a specimen must be at a time when few flowers other than spring bulbs, are in bloom, and while yet even the leaves of trees are too small to enliven the landscape. Few trees are so entirely beautiful as Magnolias. Groups of the best sorts are superb. While the trees should be arranged closely enough together to enhance the beauty of all by individual contrasts, they should not be placed so closely together as to interfere with each other's growth or with the form it may be desirable to give them by cutting back. For some of the Magnolias, the free use of the pruning knife is indispensable, while for all a more compact growth and better adaptation to the lawn are thus assured.

The Endurance of Hyacinths as Determined by Color.

Six years ago we imported about 250 Hyacinths of the various colors. These bulbs gradually deteriorate, seldom blooming the second year or in any succeeding season as well as during the first. As many as half of those referred to have ceased blooming. Some of them bear a flower or so. About fifty still bear racemes of goodly size. It is a notable fact, that a large proportion of the latter are blue, and the rest red or rose. Our friends in ordering their Hyacinths another season, may therefore bear in mind that those bearing blue flowers are the most enduring, as they are certainly the most showy.

The Season

is extremely backward. Peach buds are still intact, while cherry trees are only beginning to blossom. Spring and summer are coming more nearly together than ever before since we have lived in this Happy Valley, and one of the results is the promise of one of the most abundant fruit crops "known to the oldest inhabitants."

HINTS ABOUT GARDEN WORK.

Trees have no business in a farmer's vegetable garden; that is to say, a tree there is a weed and a nuisance, however valuable in its proper place. The fruit garden is itself not less important or valuable than the vegetable garden, but the two do not go well together. In close village lots there may be too little room for both in separate places; but a farmer's garden presupposes plenty of land and room enough to do what one wishes. Even the perennial vegetables, as asparagus and pie-plant, are better off in one corner or by the side of the garden out of the way of the plow, harrow, roller and cultivator.

Starting with smooth ground free of encumbrances, one should aim to get everything in long, straight rows, and, as far as possible, with distance enough between them for a horse and cultivator to pass through. For some things this wastes land, but it saves work which, on a farm where land is abundant and labor scarce, is much more important. Weeds grow fastest in a garden, and here, if anywhere, the farmer needs every advantage in keeping them down. At least once a week the cultivator should be run through the rows. This will destroy most of the weeds, and, if there is nothing in the way, will take very little time. The few vegetables which absolutely need to be in beds may be put on one side of the garden—a row of beds to be cared for wholly by hand labor. This little part of the garden will, without doubt, be more trouble than all besides.

Nothing is gained by too early sowing of any garden vegetable. Some kinds are hardy and will start to grow before the ground is fit to work. My self-sown lettuce is always earlier than that which I can get from sowing in the spring; but I sow it, so as to have a later and better supply. Of peas I sow the early and second crop at the same time—the Little Gem for early and the Advance for later, and in two weeks after the first sowing, I put in some more of the Advance for the latest. I have never been able to do much with melon or cucumber seeds planted in bits of sod, as they do not start quickly in such soil and are difficult to transplant. The better way is to wait a little longer and force the plants rapidly forward by putting a square box over them to keep the hills from the cold winds. In this way seeds planted the middle or twentieth of May, are strong, well-rooted plants by the time warm weather comes and the boxes have to be removed.

Few farmers have or need to have hot-houses, and it is cheaper to buy the few tomato plants needed to supply the family than to try to grow them. More depends upon the stockiness of the plants than on their hight. The same is true of cabbage and celery, though if large quantities are wanted, these may be grown at home, as they can be planted in the open ground and grown at small expense. To make the plants stocky, cut off the tips of the leaves after they get a few inches high, and at the same time run a sharp knife among their roots. This will have nearly the same effect as transplanting in pushing side roots, without in any way injuring the plants.

Monroe Co., N. Y. W. J. Fowler.

Floricultural.

FLOWERS.

When we take into consideration the beauty of flowers and see how much they add to the attractions of homes where they are cultivated, does it not seem strange how anyone can neglect to cultivate them? I do not see how anyone can help loving flowers and taking pleasure in training them and caring for them. A home may have all the luxuries human hands can fashion, but unless flowers are there cultivated, it will not be remembered by the children who go out from it, with so much tenderness as the home that is surrounded by flowers. Therefore, parents, is it not for your interest to cultivate flowers and encourage your children to do so also?

All that has a tendency to make us happier and better should have a place in our sympathies; therefore, it should be made a point by all to have at least a few flowers. How refreshing, after laboring in the field all day, to spend a little time at evening among the flowers and breathe their delicate perfume; it seems to refresh and rest us. Their cultivation need take but little time, and what little time it does take, is very well spent. In fact, I think, it could rarely be put to any better use. The majority of farmers' wives love flowers, and a great many more of them would have flowers, if they had the conveniences; but the front yard on many farms is filled up with old, broken-down wagons, plows, harrows, mowing machines and other implements, besides the wood-pile and chips, thus leaving no place for flowers, which should always be found there. Every farmer should provide a good wood-pile, but I have been thinking, lately, that instead of having a big wood-pile, with a lot of chips scattered about the yard, it would be better to prepare the wood at some out-of-the-way place, and not haul it to the house until ready to be piled up in the wood-house. By this method a large amount of litter would be kept away from the door, and if one must have farming implements out-of-doors, let it be about the barn, and not in front of the house.

Steuben Co., N. Y. F. H. D.

Abutilon insigne.—This is a fine variety of the Abutilon family, which, though old, is still quite rare, and deserves to be more generally grown. In a November number of "The Garden" it is figured under the name of "Abutilon igneum," but later on in December number of the same paper, it is spoken of under its proper name of A. insigne. As long ago as 1860 we had fine, large plants of this variety, which we had grown purposely for winter blooming, producing large, pendulous clusters, of velvety, crimson flowers, veined with dark maroon, in great profusion all winter long. Unlike any other variety, this throws its flowers well out from the foliage, each terminal shoot being literally loaded with perfect, bell-shaped flowers. The leaves are of a rich, dark-green, of thick texture, and prominently net-veined on the under side. This variety is quite distinct in leaf and flower from any other, and deserves to be in every collection. C. H Hovey.

Arboricultural.

A RULE TO BE REVERSED.

When most people buy trees, or engage them, they are very particular about the tops. They want big tops. They never say anything about the roots. The rule should be reversed, and the roots should be the subject of anxiety. Half of the trees which are transplanted every year, are murdered outright. Their roots are so mutilated and broken off that their lives are destroyed, no matter how well they may be set out. If all such trees only have large and thrifty tops, the guileless buyer thinks he has the worth of his money, and forthwith digs a hole and *sticks* his stubs in. The trees, all tops and no roots, contain sap enough to leaf out, and then they begin to dry up, and before mid-summer they are dead. Every tree received by the purchaser, without good roots, should be sent back to the shipper. How many times has it been urged upon those who purchase trees to cut away the tops, so that they will conform in bulk or size to the roots. Many trees might be saved if the tops were thoroughly cut away, even if the roots were feeble. The tops should not extend from the body an average distance any greater than the length of the roots, and the limbs should be thinned out, so as to reduce the amount of foliage down to the strength of the roots relatively, so that one can support the other, as this is the way trees grow. The roots are the stomach and the leaves the lungs. A tree all lungs cannot grow. There must be blood (sap), and this comes from the roots. A tree with good roots will make leaves, whether there is any top or not. The sap, active and vigorous, will

force latent buds out from the bark of the body, and these will grow into limbs, and form handsome and thrifty tops.

The important thing, then, in setting trees is to have plenty of roots, and to have the earth so placed around them that there will be no lack of moisture. This can best be done by putting the richest soil next to the roots, and then filling up the hole with manure, well rotted, and soil on top. If a dry time should come, cover the surface of the ground around the trees with manure, or some other mulch. A good rule for trimming fruit trees is to cut the tops down when transplanted, so that a half-bushel can be put over them. This is as good as any arbitrary rule can be, and it will be found to be on the safe side. Fully one-third of the trees set out each year never come to bearing, and some careful observers put it as high as one-half. This ought not to be so, and would not, if there was more care in digging and close pruning of the tops. It is also a mistake to buy large trees. Smaller ones are more apt to live, and will generally bear fruit first, because they have more roots. They will also make longer-lived trees.

Farm Topics.

BUYING IMPLEMENTS FOR CASH; CO-OPERATIVE PURCHASE OF COSTLY TOOLS; PARTNERSHIP FARMING.

T. H. HOSKINS, M. D.

THE rapidly-increasing use of mechanical appliances in agriculture is becoming a most serious matter, especially to small farmers, and I am glad to see it discussed editorially in the RURAL. A vast amount of the almost hopeless indebtedness now weighing, like an incubus, upon the hopes and prospects of farmers of moderate means, was incurred for tools and machines that they thought they must have, because their neighbors had them. The agricultural implement "drummer" is on every farm; he is generous in giving credit at a generous price; but pay-day comes quicker than the money can be made out of the machine, and pay we must. Having contracted the debt, it is better to pay it, but how much better, even if the farm must be mortgaged to raise the money, would it be to buy for cash, rather than to pay 50 or 100 per cent. advance in price for a twelve-month's trust!

A farm machine agent was in my house yesterday. In reply to questions, he said the business went hard, and he found those most willing to buy were men so heavily in debt that they knew they could never pay. "Hard business," said he, "to sell dairymen anything, with butter bringing only 15 cents a pound." Men are becoming prudent, but many of them are doing so too late to save themselves. Thousands of farms in Vermont must go under foreclosure within a year, if the mortgagees dare to sell. Lots of them will never bring the amount for which they are bonded; for, besides the decline in value, the embarrassed farmers have, in their poverty and discouragement, let fences, buildings and land run down until the buyer must be prepared to add to his purchase many a heavy balance for immediate repairs and fertilizers. Many of these over-mortgaged farmers also owe largely for implements and supplies. Of some of those who have died in my neighborhood within the past few years, supposed to be quite well-off, the estates have paid less than fifty cents on the dollar. The commercial press which has been congratulating the farmers on the superiority of their position over that of the business classes, shows great ignorance of the true situation. An indebted farmer hangs on long, especially when his creditor delays, in order to coax a few more years, interest out of him on an investment from which he fears that he cannot realize the principal. It appears to me that half the farming land must change hands in the next two or three years. The most puzzling question is, who is there to buy it? It would seem that all the land, as well as all the money, must be in comparatively few hands when settling-day is over. We have servilely copied England's financial methods, and are realizing England's results. But for those of us who have not been caught in the nip, who can pay our debts though by the hardest effort, whom the usurers have not quite skinned alive, but who are left for the "next haul," what lessons have we learned? Mainly what the RURAL has so forcibly put in its editorial, "Cash versus Credit." These ideas were the fundamental ideas of the "Grange," and their promulgation, seven or eight years ago, had weight with many, who owe their financial safety to-day to these principles reduced to practice. If more had come into the ark then, there would have been less wailing now.

Certainly we must buy no more of anything on time. We must consider well before buying any new implements whatever. Let us fix up what we have, and take better care of them. Some of them are in the fence corners now, with a mourning drapery of dead weeds over them. The wastefulness of the flush times must come to a dead halt. The economical practices of our fathers must be revived. And, O brother farmers, had we not better study the science of government, and send somebody other than lawyers to Congress? Something of our "hard times" is due to our own personal short-comings; but how much more to ignorant and venal legislation!

What costly implements we must have, let us buy for cash, and as much as may be in partnership, and let us see if we cannot use partnership property honestly and carefully enough to make it profitable. It is only honest and careful men whom we can afford to join in such purchases. One scalaway will burst up the whole thing. Let us have some sound rules as to the use of company implements, and live up to them. Don't keep them idle when another is waiting for them. If one is broken, have it repaired at once. And when the season of use is over, don't allow everybody's business to be nobody's business; but clean, polish, oil and paint, and put safely away till the next season. Why cannot we be as careful and proud of the company harvester as firemen are of their engine?

Many of our unfortunate farmers who have lost their land, have yet some property saved to them under exemption laws. These may sometimes rent land, and sometimes why may they not rent or buy in company, and till in company? Farmers are too independent, we are told, to do well in business association. They pull all ways, quarrel, and break up. These times ought to bring—with their other lessons—the lesson that such "independence" is utter folly. If good men will join to farm together as a company under the general laws of many of the States, with simple but strict rules and sharp penalties for their violation, there is no reason why five or ten men cannot take hold of a piece of land sufficient to give them profitable employment, hang together, and make a living and more too. It is a good school, not only of fellowship but of farming, and all having the benefit of what each knows. Such a "farmers' club" ought to make co-operation a success.

EVILS OF THE CREDIT SYSTEM.

"GO IN debt if you want to make money," was the advice which a successful old man once gave me, but he immediately added, "You must know what to buy, how to buy, and where and how to place your indebtedness so that it will neither annoy nor cripple you."

What are the debts that annoy and cripple? First: Store bills, grocery bills, shoe bills, butchers' bills, printers' bills and, last and greatest, farm machinery and implement bills. If you purchase on credit, the chances are that many things will be bought which you could do without, and some which will result in positive damage. At the end of the season, there will be owing twice as much as you counted upon; for the man who habitually runs in debt, always guesses at things. Who ever guessed high enough on a store bill? The result is, he never has any money that is his own, and never knows when he will have, but guesses he'll have some next week and makes promises on the strength of his guess. Of course, he breaks them and dodges around the corner to avoid his creditors. He is accounted by good business men a liar, and I think the term is not too strong. But this is only one of a score of debts due and promises broken. How long can the debtor thus prevaricate before he *becomes* a sneak, a liar and possibly a thief? With all manhood and dignity gone, how can there be any noble aspiration, energetic effort or true enjoyment? Who can be a man and yet be ashamed and afraid to look his neighbor in the face? This is what the old man meant, I judge, by debts that annoy and cripple.

But in the course of human events it is frequently necessary to get into debt. I have even, by implication, advised doing so. Let us suppose that some farmer this spring finds himself without money. In looking over his fields and herds, he judges that in all probability he will have one thousand dollars' worth of products to sell during the year; even with a bad season five hundred can certainly be realized. Suppose, now, he makes arrangements to borrow a hundred dollars on the first day of each month for five or six months, beginning with June, giving his note or other good paper payable within one year, or before, with interest; what will be the result? In the first place, he preserves his manhood; for who was ever ashamed to meet his neighbor because he owed him a hundred dollars which were properly secured, for the use of which he was paying a fair compensation? I speak from actual knowledge when I say that ten per cent can be saved, on an average, by paying cash as against credit; and at least another ten per cent will invariably be saved by doing without those things that can as well be dispensed with as not, but which are too frequently purchased when *charged*. What prevarications; what sleepless nights; what dodgings and squirmings; what loss of Christian character and manhood; what law-suits and quarrels; what hatred and misunderstandings between neighbors; what sacrifice of property; what long lists of failures and figures might be avoided, and what vast sums of money saved, if all would only pay CASH or its equivalent, and thus fulfill the scriptural law, "Owe no man anything."

R.

PAY AS YOU GO.

I THINK one of the worst evils the farmer has to contend with is going into debt. Many and many of them are always in debt, for their machinery from year to year and to their blacksmith and their merchant from one year's end to another. Men of this class always have to sell their wheat as soon as they can thrash it, and haul it to market, their corn as soon as it is ripe enough to gather, and their stock as soon as the animals are salable. They have no choice. They cannot wait for a better market because if they keep the merchant waiting too long, they know there will be no chance of getting credit another year, and it takes all they have got this year to square up old accounts. As a rule such farmers are obliged to sell at low prices and pay the highest price for what they use, and therefore lose on both sides. Most farmers will find it far easier and a great deal more profitable to pay as they go. There is no question but that they can get goods cheaper for cash. Any merchant will tell you he can afford to sell goods for less money, if he gets the cash every time instead of waiting six months. Precisely the same is the case with all with whom the farmer deals, and it will pay any one to live close for one year in order ever after to be free from the galling pressure of debt. Do without everything that you possibly can live without. Do not buy a new plow, or a new harrow or any other new implement simply because you can buy it on credit. Wait, and wait patiently, until you can pay as you go, and you will be surprised how much you will save in a year; for I honestly believe any farmer will buy more, when he is buying on credit, than he will if he pays cash every time. It is those who are in debt, head over heels, that feel the hard times so severely. We farmers who are out of debt now, are the most independent class of men in the country. Keep out of debt.

N. J SHEPHERD.

Entomological.

PARASITES ON DOMESTIC ANIMALS. No. 2.

PROFESSOR A. J. COOK.

Sheep-Tick. (Mellophagus ovinus, Linn.)

THIS insect is a degraded Dipteron of the family Hippoboscidæ. Some members of the family, like the horse-tick or forest-fly, have wings; but the sheep-tick is apterous. The body is not compressed laterally as is that of the flea, but from above. The head is not sunken, as stated by several authors, as will be seen by Fig. 1, which represents the head and its organs. The antennæ (Fig. 1, c) are minute, sub-globular, and deeply sunken into pits. They are covered with very fine hair over their entire surface, while from the front project quite coarse hairs. It is stated by some entomologists that these organs are close together, which, as will be seen by the figure, is not true. The eyes, (Fig. 1, d) are long and narrow. The proboscis, (Fig. 3, a) is plainly visible, and as long as the head, and is really a tube within a tube. The outer tube consists of

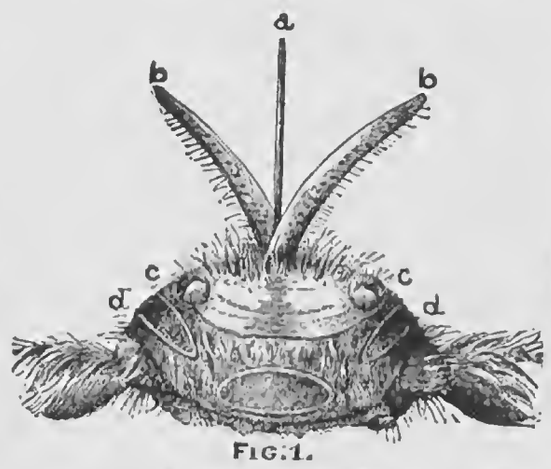

FIG. 1.

HEAD OF SHEEP-TICK.—MAGNIFIED 25 TIMES.

two semi-cylindrical pieces, (Fig. 1, b, b,) probably the mandibles, though some authors call them the maxillæ, which, when close together, form a very perfect tube (Fig. 3, a), within these is the second tube (Fig. 1, a) which is twice as long as the other, though, when not in use, it may be so withdrawn as not to extend to the middle of the other tube. I have seen this inner tube protruded to double the length of the other while I have been holding the insects in my hands. This central tube (Fig. 1, a) consists of three pieces; one, the larger—without doubt the labium—is grooved, and so receives the other slimmer lancet-like pieces—the maxillæ, I think—as to complete the tube.

These spider-like ticks move with equal facility forwards, backwards or side-wise. Their claws (Fig. 2, e) which terminate the feet, are

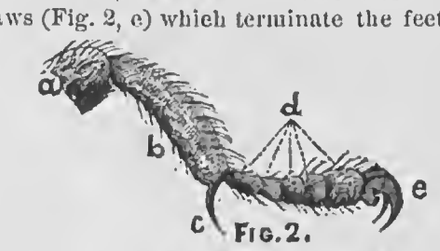

FIG. 2.

TIBIA AND TARSUS, WITH CLAWS.

sharp and strong, and so toothed as to enable the insects to hold persistently to the wool or hair of the animals they infest. The insects of this family may almost be said to be viviparous. The oviduct of the female expands into a sort of uterus, where the one or two larvæ are developed. These are nourished by a kind of milk secreted by the inclosing organ. They pupate at once after birth, in the larval skin, which then assumes a brown color.

The sheep-tick (Fig. 3) is a gray-colored,

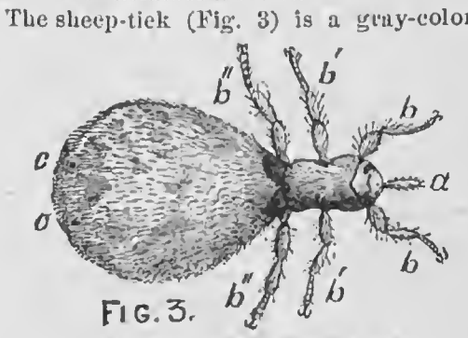

FIG. 3.

SHEEP TICK, MAGNIFIED FIVE TIMES.

spider-like insect, about five-sixteenths of an inch long. The gravid female is lighter-colored, a little the larger and mottled, (Fig. 3). The head is broader than the thorax, while the abdomen is rounded, leathery, and with no appearance of rings. In the axle of the legs on the femur, (Fig. 2, a) near its union with the tibia, (Fig. 2, b) are elongated, transparent areas, where may be seen a distinct pulse.

Just back of each leg on the thorax, may be seen the stomata or breathing mouths. These spiracles extend along the side of the abdomen, not merely to the posterior lateral angles, (Fig. 3, c, e), but even form a crescent on the posterior extremity about the vent.

FIG. 4.

The pupa (Fig. 4) is brown, spheroidal, and exhibits the two rows of spherieles very distinctly.

This insect is a serious annoyance to sheep and especially to lambs. It is note-worthy, that it attacks coarse-wool sheep much more seriously than it does the fine-wool breeds, and the long-wool varieties worst of all. This is doubtless owing to the less amount of oil in the wool of the long-wool breeds.

Remedies.

Prof. James Law recommends the following for ticks and also for scab: "Tobacco, 16 pounds; oil of tar, 3 parts; soda ash, 20 lbs.; soft soap, 4 lbs., water, 50 gallons. Boil the tobacco and dissolve the other agents in a few gallons of boiling water, then add water to make up the fifty gallons. This will suffice for fifty sheep. Each sheep is kept in the wash for three minutes." One pound of tobacco steeped in five or six gallons of water is an effective cure. The lambs and newly-shorn sheep are to be immersed in the decoction. I have no doubt but that the kerosene and carbolic acid washes recommended for fleas would avail equally well for ticks. I do not think they would be too strong, as I have kept a poodle dog in such a fluid for some minutes without hurt, and I should expect a lamb or sheep would have no more tender skin than such a dog. Tobacco smoke is sometimes recommended; but it is difficult to make the application sufficiently thorough. To apply this nothing is better than than the patent bee smokers. The smokers should be applied at least three times at intervals of a week, that pupæ may all develop, and the successive broods be killed. — (Drawings by S. Upton. —EDS.)

Mich. Agr. College.

Miscellaneous.

CONCENTRATED MANURES vs. CONCENTRATED FODDER.

PROFESSOR G. C. CALDWELL.

IN all good farming, except what passes for such on our Western prairies, the draft made on the stock of plant-food in the soil by the exportation of produce from the farm must, as all good farmers know, be made good in some way, or else partial exhaustion of the soil will follow, and along with that, poor, unremunerative farming. This restoration of exported matters may be accomplished by the importation either of commercial, or, as they are better called, concentrated manures, or of concentrated feeding-stuffs.

Of these two methods of maintaining the fertility of the soil, the latter is more largely practiced than the former in England, as is shown by the following tabular statement,

compiled from a very valuable and interesting article on present British agriculture by John Algernon Clarke, in volume XIV. of the Journal of the Royal Agricultural Society of England, in which the expenditure per acre for manures and fodder is given for several large farms.

	For Manures.	For Feeding-Stuffs.	Total.
1.	....	16.50	16.50
2.	1.50	2.15	3.65
3.	2.50	8.50	11.50
4.	3.20	11.10	14.30
5.	1.75	5.00	6.75
6.	....	11.10	11.10
7.	3.50	3.50	7.00
8.	2.00	10.20	12.20
9.	....	15.00	15.00
10.	2.00	8.50	10.50
11.	2.00	10.00	12.00
12.	....	11.50	11.50
13.	.50	4.50	5.00
14.	....	5.00	5.00
15.	2.10	4.00	6.10
16.	3.00	14.00	17.00
Mean.	2.18	8.78	10.96

On one of these farms, with 180 acres of arable land and 240 acres of pasture, $7,000 are expended annually for feeding-stuffs; on another estate, with 820 acres of arable land and 70 of pasture, the annual outlay for oil-cake is $6,000; on another farm over 300 tons of oil-cake are consumed annually.

This purchased fodder consists mostly of oil-cake, with some grain, although in some instances more grain than cake is purchased. The use of oil-cake in Great Britain has increased rapidly within the last few years. In the first five months of 1873, 57,168 tons were imported, and in the corresponding portion of 1875, 91,000 tons. In 1878, 201,300 tons of imported cake were used for fodder, besides the large quantity made in the country from imported seed.

The cake that is used in England is made from linseed, rape seed and cotton seed, and it is the use of the last-mentioned kind of cake, especially, that is increasing so rapidly; the quantity of it imported in 1878 was one-third greater than that of 1877. We ourselves send across the water large quantities of both linseed and cotton-seed cake; the value of the cake exported during the last fiscal year is stated to exceed $5,000,000.

In the following table the composition of several varieties of oil-cake is given, including the results of some recent analyses.

I. Rape cake, ordinary composition as used in Germany.

II. Linseed cake, ditto.

III. American linseed cake in England in 1873.

IV. English cake, ditto, eleven samples.

V. Peanut cake, average of 23 analyses in Germany, 1877.

VI. Cotton-seed cake, not decorticated, manufactured by a French firm in Marseilles, that turns out 150,000 tons per annum.

VII. Cotton seed cake, decorticated.

	Water.	Albuminoids.	Fat.	Carbhydrates, etc.	Fiber.	Ash.
I.	11.3	31.6	9.66	29.4	11.0	7.1
II.	12.2	29.5	9.88	29.9	9.7	8.9
III.	11.0	27.0	11.8	30.6	12.7	7.0
IV.	12.6	29.1	12.6	26.4	13.1	6.3
V.	11.5	45.8	7.0	27.2	3.6	4.8
VI.	13.	24.3	5.0	31.6	22.6	5.6
VII.	11.2	38.6	13.7	19.4	9.3	7.6

Of all these varieties of oil-cake, the peanut or ground-nut cake, with its very large albuminoids, its fair proportion of fat, and very small per cent of useless fiber and ash, may justly be ranked first in respect to value, and next to that comes the cotton-seed cake with its large proportion of both albuminoids and fat. The peanut cake is prepared from the kernels alone; it is claimed that the butter from the milk of cows fed with it, is only entirely free from any bad flavor, but is of a superior quality, while rape cake communicates a bitter taste to the butter. Ground-nut cake made from the whole nut, shell and kernel, is, like cake made from whole cotton seed, inferior to that made from the kernel alone, and is used to some extent in England for the adulteration of linseed cake.

Cotton-seed cake, also, communicates no bad flavor to the milk or butter, and it is considered in England the cheapest kind of concentrated food for fattening animals. A writer in a recent number of a French agricultural journal, comparing the cost of albuminoids in different kinds of concentrated fodder as sold in France, estimates that, calling the cost of a pound of albuminoids in cotton seed cake 100, its cost in linseed cake would be 170, in Indian corn 350, and in barley 380.

Even he that runs may read a useful lesson from these facts and figures. The much greater prominence given to the purchase of feeding stuffs than to concentrated manures in England, where some of the most careful farming in the world is practiced, and where commercial fertilizers can be had that are generally of a better quality than we can usually get in this country; the abundance of material, cotton seed and peanuts, in our own country for the manufacture of the two best and cheapest kinds of oil-cake; the greater cheapness of albuminoids, the most important constituent of concentrated fodder, in oil-cake as compared with grain; all these considerations taken together with that of our large exportations of oil-cake, unite in indicating that American farmers do not make the best use of all the resources within their reach. We should send to other countries less of crude products and more of manufactured products; these abundant supplies of concentrated fodder should be more largely worked up into meat, butter and cheese, and, through the manure produced, into wheat, and these should be exported instead of the fodder itself.

EVERY-DAY NOTES.

Late Spring Planting.

A LATE spring, like the present one, causes many expressions of alarm lest there be insufficient time left to plant the lawn after snow and frost have gone. There is, however, much less danger in thus planting late than is generally supposed. If only thrifty shrubs and trees are used abounding in fibrous roots, little danger of failure need be apprehended, if the roots are moistened and protected at once after digging. One sees not unfrequently much useless care—in the way of watering, etc.—expended on plants that have already received their death-blow under exposure to sun and wind. As a rule, superficial watering helps the plant but little, after it has been once set out. Indeed, unless applied in enormous quantities, evaporation in the open air soon dissipates the effects of water. The advice to buy only young plants is almost as old as the hills, and applies specially to late spring planting. Yet the temptation to obtain a large tree in a short time overcomes us continually. Each hopes to be the favored one who will succeed in making such a tree grow, forgetting that if it does grow, it will hardly ever equal in perfect development a plant of more plastic nature.

The Best Time to Transplant Magnolias.

There exists a common impression even among experts, that Magnolias should be transplanted as early as possible in the spring. The experience, however, of those whose experience has been most extended, teaches just the contrary. In fact, a Magnolia should not be transplanted until the leaves begin to show signs of pushing out, which, in the case of Chinese Magnolias, is while the flower is in full bloom. There is a sluggishness in the spongy texture of the Magnolia roots, which, like that of the roots of evergreens, needs warming up before transplanting can be attempted with the greatest certainty of success.

Late Pruning.

"Better late than never" applies to pruning with at least as much force as to anything else. Wood full of sap will, of course, bleed a little after the use of the knife; but it soon heals and, in any case, acquires less deformity than it would if left over the season without pruning. To neglect hard-wood pruning, therefore, entirely during the spring, is mere unnecessary procrastination, and cannot be excused on the plea that it was forgotten until too late. Summer pruning is another thing, and should not be done in the hard-wood, but converted rather into a system of pinching back excessive soft growth.

S. PARSONS.

WHAT OTHERS SAY.

AN IMPROVED METHOD OF STRIKING CUTTINGS.—A short notice has appeared in a St. Petersburg journal, says Mr. Henslow in the London Chronicle, of my paper on the absorption of water by the green parts of plants; and it appears to have suggested to Mr. G. Weidenberg a method of striking cuttings. After inferring that the frequent fading of cuttings, before they have struck root may be accounted for by a too great transpiration, he proposes making the cuttings longer than usual, and burying some of the leaves as well as the stalk, so that about a third remain above out of the earth. Those leaves in the ground may thus undertake the function of absorbing moisture, and so help to balance the loss of water from the exposed leaves. The ground, he adds, in which cuttings stand should be, if possible, porous, in order that the air may have access, and that the rotting of the leaves may be prevented. This process enables the cutting to make roots before the leaves decay. Weidenberg appears to have found that Roses of all sorts, Pinks, and other cuttings of plants thus made very good roots, which are usually hard to grow. In my paper I only alluded to cut flowers having leaves attached to the stalk and plunged into water, but the principle is the same as for striking cuttings, and it is so easy to try that gardeners can readily put it to the test and see if their results will accord with Weidenberg's experience."

SURE DEATH TO MOTHS.—We find the following in the N. Y. Tribune: A set of furniture is mentioned in Massachusetts papers that became infested with hundreds of moths. The seven pieces were put in a room by themselves, and three gallons of benzine, costing 90 cents, thrown over them, out of a small watering-pot with a fine rose, "saturating them through and through." In a few hours they were dry; all odor disappeared in three or four days; no injury was done to varnish, wood, fabric or hair-stuffing, and now, months after, not a sign of moths has since been seen. The carpet was also sprinkled all around the sides of the room with equally good effect. This is said to be "a sort of trade secret among upholsters."

THE FUTURE OF THE HOME DAIRIES.—B. F. J. concludes an article in the Country Gentleman thus: "As an illustration of what is meant, let us take the butter and cheese industries of the country. If we look at the matter closely, we shall see the time is rapidly approaching when the practice of the home manufacture of butter and cheese will have been abandoned as completely as that of woolen or cotton cloth, and the farmer will sell his milk, as he sells his wool, and perhaps buy butter and cheese as he now buys cloth and yarn."

CATALOGUES, &c., RECEIVED.

DISEASES OF LIVE STOCK and their most efficient remedies, including horses, cattle, sheep and swine. This work, of 469 pages, is a popular treatise giving in brief and plain language a description of the diseases common among stock and the treatment therefor, culled from the works of the best American, English and Europeans veterinarians, together with a great deal of miscellaneous veterinary information of use to stock-owners. Every farmer's library should contain a reliable work on the diseases of stock, to whose lucid description and prescriptions he can at once refer on first appearance of any ailment among his stock. The present compilation is the work of L. V. Tellor, M. D., and sold only by subscription at $2.50 per copy. Philadelphia, N. C. Watts & Co.

Industrial Implements.

PULLIAM'S BOLSTER SPRING.

THE bolster spring is an invention of decided merit and usefulness. It adjusts itself to heavy and light loads, and under each condition meets the requirements demanded of a good spring. It is particularly adapted to farm and lumber wagons of any size. Its attachment is simple, being fastened to the bed with four bolts—and the spring goes with the bed when the latter is lifted off. An over-load or sudden jolt will bring the bed down to a rest on the bolster, and this not being the full tension of the spring, it may be surmised how very difficult it would be to break it. Indeed, the spring cannot be strained to its fullest tension.

Its application to a wagon saves wear and tear of the running gears, does away with the necessity of a spring seat and makes an ordinary heavy wagon ride as easily and comfortably as a light conveyance. They range in capacity from 2000 to 3500 pounds and are made of oil-tempered steel, and warranted. It is some time since our attention has been called to an improvement of this kind that has so many excellent features. Those of our readers who have a prejudice for working as comfortably as circumstances will permit should write for the circulars with which we have been favored. They show the application of the bolster spring much more satisfactorily than can be indicated in a brief mention. The makers are Semple, Birge & Co., St. Louis, Mo.

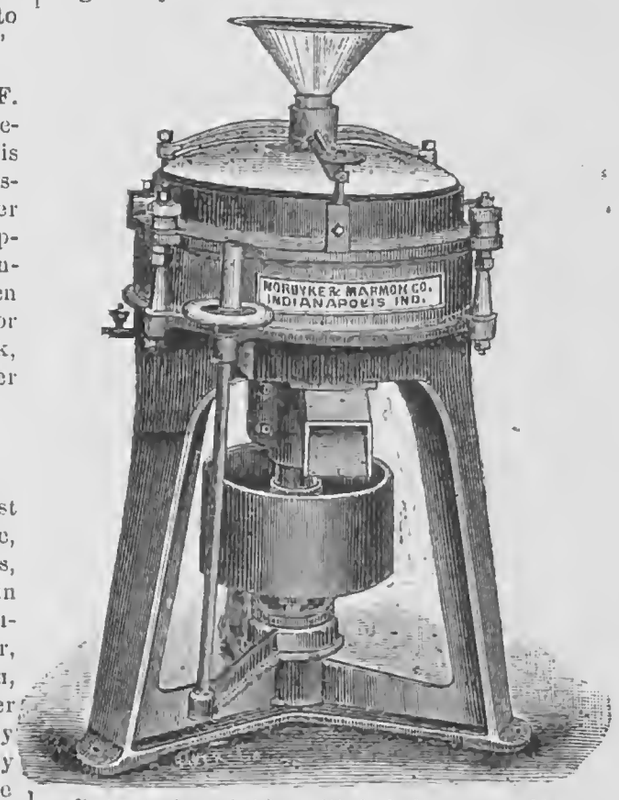
THE "NEW ERA" PORTABLE MILL.

WE illustrate herewith the twenty-inch mill, "New Era," which the Nordyke & Marmon Co., of Indianapolis, Ind., have lately perfected.

Careful study and experiment in the premises have led them to design the mill represented by our engraving, and to adopt for the same a quality of French buhr-stone which they import expressly for the purpose. This mill is placed in an iron hurst frame, and every part so accurately fitted that should the material be exhausted from the hopper, the mill will continue to run without detriment, even though empty. As all of the material entering into construction of this mill—with the exception of the stones—is either iron or steel, and every part accurately and perfectly adjusted and balanced, the utmost steadiness of motion and durability are thereby attained. As the bearings are perfectly fitted, and all provided with suitable receivers from which oil is at all times supplied to them while in motion, the utmost lightness of running is attained, and the stones being of equal thickness and in perfect running balance, insures against all trouble from that source.

In flouring middlings, wheat or grinding corn on this mill it is only necessary to keep the furrows and faces straight and follow the special instructions sent with each mill; the instructions having been carefully prepared for the particular material to be treated in each case.

The buhrs, when faced and operated as directed, are so true, it is claimed, that they will run to within a thousandth part of an inch and not touch, and as the French buhr stone used in their construction is of a special quality not liable to glaze or get smooth, they will retain their sharpness a very long time, and upon wheat or middlings do as nice flouring as any other mill.



But one size of this mill is being manufactured, the stones of which are twenty inches in diameter. The improved silent-feed attachment is provided and used with this mill, as shown in the engraving; and in fact each and every feature and detail requisite for the attainment of the best and most satisfactory results, in the smallest possible compass and at least expense for first cost and maintenance, has received the careful attention of, and been adopted by the manufacturers.

For particulars and special information we refer our readers to the firm, as above.

THE OLIVER PLOW.

THE success of this plow has been an event in the annals of farm implements. During a period covering only nine years, there have been made and sold over 250,000 plows, and today the works cover a larger area than any other establishment of the kind in the world, we believe, devoted to a like purpose. This result has been attained by introducing a new feature in the manufacture—chilled metal—and giving the most careful attention to the design and construction of the implement. The managers are idealists on the question of plows and constantly strive after perfection. We are glad to be able to say this, as it is only meet that the most important interest of our country—farming—should be supplied with the most effective tools. The Oliver Chilled Plow Works, South Bend, Ind., will send, on application, a description of their process of chilling metal which is interesting of itself.

AMONG the many new mowers of this season, the "Pennsylvania," made by Lloyd, Supplee & Walton, Philadelphia, Pa., commands attention. It has lightness combined with strength, is easily adjusted, not likely to clog in any kind of grass, and is very handsome. The cutters are all steel, bent and tempered in dyes under hydraulic pressure, giving a true and uniform curve. The circular sent out by the makers, is almost pretty enough to be framed, and in it will be found particulars.

THE Penn. Agricultural Works at York, Pa., are under extraordinary pressure this season, so it is reported. They have not as yet caught up with the orders booked, and have been working over time. Mr. Farquhar, the proprietor, has been very successful in devising machinery that meets with popular approval. The many inquiries we have had for light thrashing machinery, might well be directed to this firm. The catalogue issued this season is extensive and complete.

THE BOOMER AND BOSCHERT PRESS CO. of Syracuse, N. Y., write us that there has been a very considerable reduction in the prices of their apple-graters. These graters have in the past sold at prices ranging from sixty to eighty dollars, but such was the efficiency of the machines that large numbers were introduced despite the cost. This reduction will be good news to cider-makers for whose benefit we chronicle it.

MR. J. R. WHITTEMORE of Chicopee Falls, Mass., is making a rake that is equipped with a patent tooth. Its shape causes it to avoid scratching up the dirt, so it is claimed, and in addition to this feature, it has many others found in all good rakes. A reference to the advertisement in this issue will give a correct idea of its shape.

The Querist.

ANSWERS TO CORRESPONDENTS.

Culture and Preparation of Horse-Radish, Etc.

M. S. M., Lynhaven River, Princess Anna Co., Va., asks, 1, how to raise and prepare horse-radish; 2, can asparagus beds be removed, or new ones be made from old beds, or do they become too thick after a while; 3, is the Royal Mfg. Co., Broadway, this city, a reliable concern; 4, in our issue of Jan. 25 was an advertisement of J. T. Clymer, offering a recipe for increasing potato crops from 50 to 100 per cent., to be paid for after the crop had matured, and he asks whether the party is trustworthy, as he wrote to him, but received no answer.

ANS.—Horse-radish will grow in any soil, but, as with most vegetables, the better the soil, the better the crop, and the best results can be obtained only when the plants are grown in very deep and rich garden mold. Market-gardeners in the vicinity of New York generally grow horse-radish as a second crop; that is, the sets are planted between the rows of early cabbages, beets, or other crop, and the top subdued till the growing crop has been removed. The sets are the slender roots from one-fourth to one-half inch thick, that are removed from the main roots when taken up in the fall. They may also be produced by planting the "crown" (that is a couple of inches of the top-end of the old root) in the spring, from which will shoot out an abundance of just such roots as are required for sets. But whichever way they are grown, they are taken up in the fall, tied in bunches and either buried in the ground or kept in sand in a cool cellar through the winter. On the opening of spring they are again taken up and prepared for planting, which consists in rubbing off the side roots with a piece of coarse cloth, and in cutting them off at the proper length—eight to twelve inches. In planting, make a hole at an angle of about 25 degrees, with a sharpened stick. Into this hole drop the set and press the soil closely about it. Care should be taken to plant the set with the root-end downward, for though it will grow when reversed, it does not attain as large a size as when put right-end-up. The plants are set in rows one by two feet apart; if planted among another crop, the distance can be varied to suit the space. During summer the culture consists simply in keeping the patch clean by frequent hoeing. It is dug late in the fall, care being taken to remove all small rootlets, as they will grow and prove troublesome weeds if allowed to remain in the ground. The sets for next year are cut from the marketable roots, and these are sold or stored in a cellar convenient for use. In Europe, to facilitate the digging in the fall, this vegetable is generally planted on raised beds two feet wide. When horse-radish is planted on very rich ground, under the most favorable circumstances, as much as four or five tons can be obtained per acre, but three or four tons may be considered a fair crop. Twenty sets planted every spring will be enough to supply an ordinary family. In preparing the article for market, the roots are taken from the pit—the tops and small roots having been trimmed off before they were stored in the fall—thrown into a wash-tub, and, with the aid of a scrubbing-brush, thoroughly cleaned. In this state the roots are sent to market. 2. It is not practicable to plant old asparagus plants, as the roots must necessarily be mutilated to a greater or less extent in digging them up. Strong one-year-old plants are best. The roots do not generally become too thick in the bed; the shoots become smaller in time, because the roots lose vigor and the soil becomes exhausted. 3. We would advise our friends to have nothing to do with a firm with so magniloquent a name. 4. This is the first complaint we have heard in that connection.

Malignant Anthrax.

S. E. W., Tiptinville, New Mexico, say: "I found one of my work steers dead in the corral and on opening the body I found the melt (spleen) very much enlarged with a portion of it decayed, or rather it would fall to pieces when handled and was covered with purple spots. The steer seemed to die without a struggle—no symptoms, only a disposition to lag behind when driven to the house on the night previous. My stock graze on the open prairie and have good running water to drink. I fed some of the meat to my hogs and, though they ate but little of it, five of them have died and I expect to lose three or four more. It made my dogs sick. Can you tell me what the disease is? Is it catching? and is there any remedy for it? One of my neighbors pronounced it Texan fever."

ANS.—This is one of the many forms of *anthrax* and is generally known as *splenic apoplexy*. Within the past year the RURAL has given very full information in regard to this disease, having devoted over a column of space to its consideration on two occasions. We will repeat for the benefit of those who cannot refer to back numbers, that all animals and man are subject to the disease; that the disease is usually contracted by cattle feeding on rich soils which are underlaid by an impervious subsoil; that the prevention consists in draining such lands or keeping the cattle from grazing on them, particularly in spring and autumn. Treatment is generally unsatisfactory because the animals die so soon after they are observed to be sick. The disease may be contracted by people or other animals, but chiefly by contact with blood or other liquids from affected animals or by eating their flesh. It is very dangerous to open or skin animals which have died from this disease. The carcasses should be buried to prevent contagion.

Pearl Millet.

G. H., Seneca, Nemaha Co., Kan. says: I have recently received from the Department of Agriculture, a supply of pearl millet seed. If it is the productive forage plant that Peter Henderson says it is in a late RURAL, it will be of great benefit to this State, not so much, however, in its green condition as when cured, for the difficulty with us stock raisers is more in procuring an abundance of fodder for the winter months, than in securing plenty of rich summer pasture. Wishing to give the pearl millet a fair and exhaustive trial, I would like to have the RURAL'S opinion as to the proper time of sowing it, and the best way to cultivate it by which satisfactory results can be obtained. Here, labor is scarce and land abundant, so that the way that would give us the largest amount of fodder for the least labor would be the best for us. If intended as fodder for winter, when should it be cut, and what is the best way of curing it and putting it away for winter use? By the way, I think Com. Le Due has done a good thing in attending personally to the distribution of Department seeds, instead of furnishing them to members of Congress, who, too often, sent them as favors to political partisans and friends, without any regard to carrying out the intention of the Department.

ANS.—In the above part of the country, pearl millet should be sown about May 20. It may be cut for the first time as early as the latter part of July. Then it will have time to make a growth of from four to six feet before frost. We should advise planting in drills—the drills three feet apart, the seeds two feet apart in the drills. It will not seed in that latitude, and the last cutting may be made not until after the first frost. It should be cured precisely the same as corn.

Dahlias and Gladioli.

E. K., Oxford Center, Ontario, asks: 1, will Dahlia cuttings bloom the first year if started early? if so about what time in the season? 2, should flower buds be picked off to have them in bloom about the 15th of September; 3, which will give the best flowers—cuttings or dry roots; 4, does the size of Dahlia bulbs have any influence on the flower, or will small bulbs produce as good flowers as large ones; 5, at what time should dry bulbs be planted to be in flower from the 15th of September to 10th of October; 6, about what time should Gladioli be planted in the open ground to bloom about 20th of September; also, depth to be planted; 7, give names of twelve best varieties for exhibition purposes.

ANS.—1, They will flower, if not too weak, in September just before frost. 2, No. 3, Dry roots. 4, No, the size of the roots vary greatly with the variety; if the roots are otherwise strong, the size will have no influence on the size of the flowers. 5, Dahlias do not usually flower well till the nights become somewhat cool; so the time here named is their natural period for flowering. They should be planted about the middle of May. 6, The 25th of June. Six inches, if the corms are large and the soil, light; less in proportion as the soil inclines to heaviness and the corms or bulbs are smaller. 7, Shakspeare, Princess Alice, Addison, Newton, Benvenuto, Mary Stewart, Stella, Reine Blanche, Charles Dickens, Phedre, Mad. Desportes, Rosea Perfecta.

Apple Pomace.

S. E., Galesburg, Mich., asks, 1, what is the value of apple pomace as a fertilizer, and what is the best way of preparing it for that purpose; 2, would it be practical to save it in silos for stock feed in winter; 3, where can the best and cheapest root-cutter be obtained.

ANS.—Apple pomace is of very little value as a fertilizer; if used for that purpose, it would be best prepared by composting it with lime to neutralize the acid contained in it, and to hasten decomposition, for while fresh, it would do more harm to vegetation than good. It may be very easily preserved in barrels, casks or boxes, by packing it down tightly, and is eaten eagerly in moderate quantities by horses, cattle, sheep and pigs, and it is undoubtedly a wholesome food for them unless given in excess. One peck at a feed has been given with benefit to dairy cows, and a bushel or two would be a proper quantity for 40 or 50 sheep. When kept in clean flour barrels, or crockery or sugar hogsheads, it will remain good during the whole winter. Or, it may be pitted just as roots are, which is, in fact, ensilage.

Compensation for Service of Bulls.

T. B. L., Camden, S. C., asks for precise information with regard to the rules governing the stud service of bulls. A party engaged to secure him a calf for a specified sum; after the first leap of the bull, application was made for the sum agreed upon; and our correspondent inquires whether the debt was then due.

ANS.—The services of stud animals, whether horses or bulls, are generally insured, and if they fail, they are repeated without extra charge, but the money is not returned. The custom is for the owner of the animal receiving the service to pay on the performance; if necessary, the service is repeated until effective. In the above case, the owner of the bull was right in requiring payment at the time of service. The insurance consisted in repeating the service in case of failure.

Hyssop.

M. L. D., Sherman, N. Y. asks: how is hyssop cultivated, and for what is it chiefly used; 2, is the plant now cultivated the same as that of which we read in the Scriptures?

ANS.—Hyssop is a hardy perennial herb from 18 inches to two feet high. Sow the seed in the spring and set the young plants in rows a foot and a half apart. It is used in medicine as a gentle stimulant. It promotes expectoration of the mucus and is used as a remedy for chronic catarrh. 2. The hyssop of the Scriptures is the caper tree—Capparis spinosa. It grows abundantly in the countries around the Mediterranean Sea.

Grafting Wax.

C. T., Millersville, Ohio, who inquired about grafting wax in our last issue, is hereby informed by L. A. R. that the following article cannot be beaten: Resin one pound; tallow two ounces. Melt together and add one tablespoonful of turpentine and two ounces of alcohol well mixed, and the wax is ready for use.

Miscellaneous.

J. L. V., Wilksbarre, Pa., asks where he can get dynamite cartridges suitable for blowing up stumps, and where they are manufactured.

ANS.—Dynamite cartridges can be got from Varney and Doe, 61 Park Place this city. One of the most extensive manufacturers of them is the Atlantic Giant Powder Co., located here also. As a rule it would be better to procure them through some local dealer in gun-powder and other explosives.

Mrs. F. T., Maine, Broome Co., N. Y., asks where can she get an instrument for removing obstructions from a cow's teat, such as that referred to in Querist Department in our issue of the 3d inst.

ANS.—From Whitman & Burrell, Little Falls, N. Y., or The Dairy Supply Co. of this city.

RURAL SPECIAL REPORTS.

KANSAS, La Cygne, Linn Co., May 4.—A mistake is frequently made by those coming West, in supposing that the more uncivilized a location is, and the more remote from places of habitation, the better it is for a newcomer. Such is not the case. It is not necessary for immigrants to "rough it," to secure success. The point that I wish to make is this: that to secure good land, cheap land, well timbered and abundantly watered land, it is not necessary to push West in this State. As an instance of the folly of going to the extreme of Horace Greeley's advice, let me give the following: a party of some hundred came out to Kansas last spring, were dropped off the cars at their destination in the West and found themselves miles away from supplies of any kind. Not being particularly anxious to starve, they were compelled to stop a freight train on its way to Denver and take possession of several barrels of flour. The trouble with them was, they were not content with coming West, but had to go "Wester." It is a fact, that a great majority of those who go so far West, return to a more easterly point.

The county of Linn, where I live, is in the southeastern part of the State. It is considered one of the most productive counties in Kansas, and is one of the oldest settled. In the times of the Kansas troubles, it attained considerable historical interest, it being a border county and consequently easy of access for the Missouri raiders, who overran it perhaps more than any other county in the State. The county is remarkably well watered by the Marais Des Cygnes River and its tributary creeks which form many belts of rich, valuable and varied timber. In nearly all parts water is reached with very little labor, and it has to be an unusually dry season for the wells to fail. All the staple crops can be, and are raised, and the average will compare favorably with that of any part of this immensely productive country. One peculiarity about this section is worthy of note: there are varieties of soil here precisely adapted to the successful growth of every kind of fruit, large and small, early and late. I have seen the finest small fruits here that I ever gazed upon, and Linn county can to-day boast of some of the handsomest apple and peach orchards. A significant fact under this head is that the earliest Peach there is, and a great beauty at that, originated in this county. It is called "Brice's Early June," ripened June 5th last year, and was originated by Dr. Brice of Mound City, the county-seat of Linn.

In addition to the county-seat, there are two thriving business and live towns; La Cygne and Pleasanton, where are stores which would do credit in their variety and abundance of stock, as well as in their mode of conducting business, to any city, East or West. At the point I write from, La Cygne, we are about sixty miles distant from Kansas City, the great center for Western trade and produce, and you will thus see that in this respect, we have an immense advantage over those who have pushed so far West. D. W. C.

MISSOURI, Kingston Furnace, May 6.—Hogs have been so low the past winter that corn can no longer be raised even in the West at a figure at which it can be profitably fed to them. The Granger consequently is in trouble. He wishes to raise hogs, for they are easily raised, and their number and weight are quickly increased or decreased, and then they are usually turned into cash at just that period of the year when the proceeds will enable the producer to pay his taxes and buy the Christmas presents for his family. The necessity now is to find some food for hogs cheaper than corn. For one, I think I have found that food in alfalfa. Instead of cutting it two or three times during the year for soiling, as the RURAL stated it could be done, I cut it four times last year *for hay*, and could easily have cut a fifth hay crop; for I pastured it for 60 days after the fourth cutting. For soiling purposes I could have cut it to advantage every two weeks from April 15 to Dec. 1. I expect to cut each morning what I shall feed the next day or next day but one, according as it sours. Run it through a cutting box as soon as mown; sprinkle it with meal or bran; heap it up to sour and feed it three times a day. It has been the regular practice to do this in Germany for many years in a climate as cold as Wisconsin. If we cannot observe and learn something from our neighbors, we ought to emigrate to China, where the practices of forefathers are sacred to their descendants for untold generations; but in these days of change the example of the rapid improvement of the Japanese just across the channel, might in time force a change for the better even there. N. W. B.

OHIO, Millersville, Sandusky Co., May 3.—Although the weather is a little too dry for oats, yet as a rule the crop is up nicely. Prices of all kinds of grain are low. Clover seed, per bush., $3 50; wheat, per bush., $1; corn, shelled, 32c.; corn, in the ear, 30c.; oats, 20c. Butter makers will not get very rich at the prices, from 6c. to 12c. per pound. Eggs, per doz., 9c.; wool, per pound, 25c. to 30c.; hogs, dressed, $3. Grass is up so as to furnish a living for the stock. The farmers are busy plowing for corn, and if it does not rain there will be considerable corn planted by the 10th of this month, which is early enough for this part of the country. Wheat looks splendid and it will well repay the farmers for their extra care last fall in cultivating the ground better and giving outlets to their ditches. Clawson is taking the lead here now. Pringle's spring wheat is up three or four inches and looks well. Potatoes are up also, but have to be covered up every night to keep them from freezing. I planted my tomato seeds a month ago in boxes, and now by the time that we could have sowed the seeds out of doors, I shall have strong, healthy plants instead. Father and I have been trying a few experiments this spring with potatoes. The variety is the Extra Early Vermont. To two rows we applied a handful of bran to the hill, as a writer in an agricultural paper had said that by this means he had increased his potato crop by one half. To the next two rows we applied leached ashes. Then we planted two more rows, putting half a pint of hen manure in each hill. Later on I will give the result of our experiment, if the RURAL wishes. C. F.

[We are always pleased to obtain any information likely to benefit or interest our friends. —EDS.]

NEW YORK, Elmira, May 4.—Our spring maintains its backward position, though the weather has been more favorable the past week. The period of "full bloom" will be at

least two weeks later than last year. Farmers of late have been pushing forward their work of seeding as rapidly as possible. Some have finished sowing their spring grains and have commenced preparing their corn ground. Barley was a profitable crop here last year, and for that reason a large increase of acreage is being sown this spring. If the season proves favorable, the price will be likely to fall to a low figure when the new crop begins to come in. Business in general is improving. We hear less complaining of low prices and "hard times" than formerly. Good hay sells readily at $10 per ton; oats at 30c. per bush.; corn, 40c. for 60 lbs.; potatoes, wholesale, 80c. per bush. G. A. G.

NEW YORK, Ithaca, Tompkins Co., May 7th, 1879.—Cold and dry on the surface, grass and grain would be much benefited by a warm rain. Oats and barley mostly in the ground which is inclined to be cloddy and requires frequent rolling. Some are plowing for corn but none have planted. Winter wheat is not looking well except a few highly fertilized pieces; it is thin on the ground, and makes but a slow start. No Hessian Fly at work so far as I can learn. Stock has wintered well and will go to pasture in a few days in a profitable condition. Everybody on the drive trying to make up for the long winter and late spring. R.

NEBRASKA, York, York Co., May 1.—Farmers hereabouts have finished seeding, and are now planting their corn. We have had a few gentle showers lately which have given the numerous grain fields a lively green appearance, and the prairies are dotted with herds of cattle. There will be about one-third more acreage in small grains the present season than there has been heretofore. Wheat is worth 64c; corn, 20c; oats, 16c; hogs, $2 00 per 100 lbs. York is a fine growing city, and I think it cannot be beat for a place of its size in the amount of business done there. The railroad is to be extended from here to Hastings, the present summer. I have just seen a man that spent last summer here; since then he has been to Kansas, Missouri, and Iowa and is now back here and says he finds nothing to equal York Co. We are having very pleasant weather here now. BEE.

ILLINOIS, Salem, Marion Co., May 9.—My present farm of 150 acres I bought at $45 an acre. The land hereabouts is rolling and has good drainage. In this respect it has an advantage over most of the lands in Southern Illinois, for, as a rule, these are flat, and consequently, the facilities for draining them are poor. Farmers here are very negligent about taking care of their manure. Some never haul it out, while others thrash their grain out in the field, then set the straw on fire and let what isn't burnt rot where it lies, thus securing a fine crop of weeds. Occasionally a man moves his stable in order to get it away from the huge piles of manure that have accumulated about it. G. H. W.

NEW JERSEY, Burlington, May 8.—Spring was so late that a number of my neighbors are somewhat behindhand with some of their work, but as a general thing, they are well up with it. Fall wheat is poor, except that sown very early and on extra good land. Rye is splendid. We have about an acre that stands from 15 to 20 inches high. Oats are up and looking fine. There will be a heavy crop of hay this year; grass is looking very good. The prices of farm products are as follows: wheat, $1 15 to $1 20; rye, 50c.; oats, 30c.; corn, 45c.; chickens, 18c. to 20c.; capons, 25c. to 30c.; eggs, 15c. to 20c.; butter, 15c. to 30c.; potatoes, $1. Pear trees are in full bloom and the Maples have leaves as large as cats' ears. I. W.

MISSISSIPPI, Okolona, May 6.—Crops here are very backward on account of the continued wet weather. It is also unusually cold for the time of the year. Corn and cotton crops are almost all planted, and the most forward are now ready for the first working, and if the season be henceforth favorable, the loss from late planting will to a great extent be made up by good cultivation. Oats are looking well, and if the weather turns out seasonable, the yield promises to be large. Wheat is looking very poor—too much rain. A. M.

NEW YORK, Sherman, May 5.—The weather for the past few days has been cold and dreary. Farmers are very busy at present with their spring's work. Wheat and oats and other small grains are being put in at a rapid rate. A cool breeze is to-day blowing. Snow still remains in some places, but is fast vanishing. Grass has taken a small start, and young cattle can now get a living in the pastures. Cows bring $25 to $30; corn, 50 cts. a bushel; potatoes, 80 cts. a bush.; peas, $2 per bush.; eggs, 9c. per doz. M. L. D.

NEW YORK, Youngstown, Niagara Co., May 10.—Lying along the Niagara River and Lake Erie are thousands of acres of good land on which nothing grows but grass and weeds, neither of which are valuable enough to pay the taxes on the land that produces them; yet there are hundreds of idle men in all our towns and villages, who could at least make a livelihood for themselves and add to the wealth of the country by cultivating them. J. M. S.

IOWA, Lyons, Clinton Co., May 6.—We have had very few warm days thus far this spring. These few, however, have been sufficient to make the grass fresh and bright. Deciduous trees are showing considerable foliage. Tulips and Hyacinths have been in bloom nearly two weeks. Farmers in this vicinity have finished sowing wheat, and are now preparing the ground for corn planting, which will begin about the middle of the present month, should the weather prove favorable. M. G. R.

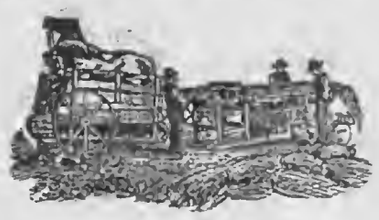
NEW YORK, Dundee, Yates Co., May 8.—Farmers hereabouts are getting down to hard work again. Grain has been sown on fall-plowed land and sowing is now going on at a lively rate. On eastern exposures fall wheat is looking well; but that on northern and western is not so promising. Grass is starting slowly. The prospect for fruit is good, buds being in fine order. W. H O.

CANADA, Chateauguay Basin, Province of Quebec, May 4.—We have yet two feet of snow at our back-door where at this season it is generally dry and sunny. I walked across it this morning and it bore my weight well. We have hitherto done nothing, therefore, in gardening. A. L. J.

VIRGINIA, Van Buren Furnace, Shenandoah Valley, May 6.—We are having very dry weather; grain and grass are suffering for want of rain. Corn planting is nearly finished. I think there will be more than an average acreage. F. K.

Implements and Machinery.

Horse-Powers,



For One, Two and Three Horses.

MACHINES FOR

Threshing and Cleaning Grain and Sawing Wood.

Patented, Manufactured and Sold by

A. W. GRAY'S SONS,

Middletown Springs, Vt.

The machines with the improvements are the result of more than thirty years' careful study and experiment.

The proprietors are the inventors, ever have been and still are the sole manufacturers.

We have labored from the first to produce machines that will be durable, tasty, compact, portable, and that will run with the least possible friction.

We believe that we manufacture the best machine of the kind in the country.

Our machines have never failed to receive the highest award at all competitive exhibitions.

Circulars and Price Lists free. Address as above.

PENNSYLVANIA LAWN MOWER

The Simplest, The Most Durable, The Best!

This machine embraces all the advantages of a light and durable Lawn Mower. Points of superiority claimed: Lightness combined with strength in construction; easiness of adjustment; least liability to obstruction from clogging; lightness or easiness of running; its attractive appearance. Every machine warranted.

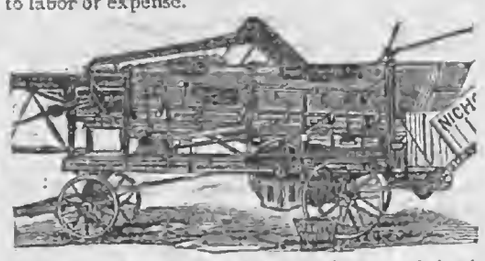
ORIGINAL AND ONLY GENUINE

"VIBRATOR"

THRESHING MACHINERY.

WE are sometimes asked why the prices of our goods are apparently higher than some others of inferior make, and we avail ourselves of this opportunity to place the matter in its true light.

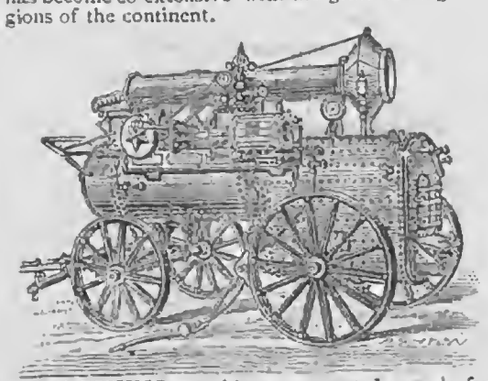
OUR "VIBRATOR" Threshers and Portable Engines embody the best results of our experience and study during our long business career. Whatever would add to their durability, efficiency, and solid excellence, in any particular, has been eagerly seized upon and utilized without regard to labor or expense.



IN this connection it will be pertinent and timely to warn the public against **Cheap** Threshers and **Cheap** Portable Engines. The superiority of our machinery, in all particulars, is now so generally acknowledged that our competitors have no resource but to present the attraction of low prices and long credit. Their goods being inferior, they have to sell them for what they can get. Times are hard; and purchasers, without fully considering the subject, will sometimes allow a lower price to decide them. Manufacturers of "cheap" machines are so set on carrying out competion to its utmost—competition of **Cheapness**, not of Excellence—that they meet "bargain hunters" half way, and furnish them cheerfully with inferior machines at the cheap rate they are asked for.

WE are much mistaken if this is what the public wants or expects of us. Good machinery cannot be made when neither workman nor employer has pride in his occupation; interest and pleasure in the work are both wanting, and both are essential in making good machinery.

OUR mission and business is, to build Threshing Machinery **of the Highest Excellence**, whatever the cost, and, holding firmly to this single purpose, we have added improvement after improvement, until the reputation of our Machines has become co-extensive with the grain-raising regions of the continent.



THRESHING machinery cannot be made for nothing, even with the aid of machinery. Our prices are as low as they ought to be, and, without doubt, as low as they ever will be. Do not be deceived with mere cheapness—**quality always descends faster than price.** Low price, especially in Threshers and Portable Engines, means **Low Quality, with Low Performance and High Repairs.**

Implements and Machinery.

Galvanized Cable Fence Strand.

The only Wire Fence that stands the Test of Time.

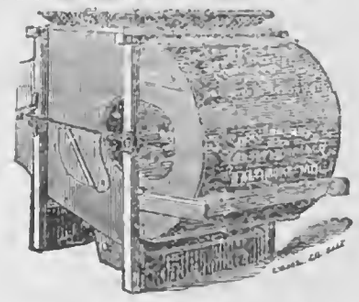
NO BARBS.

PHILIP S. JUSTICE, 14 N. 5th St., Philadelphia.

MONTGOMERY'S IMP. ROCKAWAY FAN

Gold Medal at Maryland Institute and 15 First Premiums at other Fairs in 1878.

22 FIRST PREMIUMS.

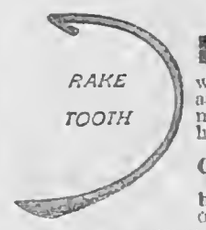


13 SILVER MEDALS.

The most perfect and substantial Fan made. It will grade, separate and thoroughly clean any grain raised upon the farm, and has been victorious in every contest over most all Fans made. An ordinary farm hand can operate it! It will save its cost in one season. Responsible Agents wanted where not introduced. Address the manufacturers for price lists and circulars.

DORSEY, MOORE & CO.,

68 S. Calvert St., Baltimore, Md.



PATENT TOOTH

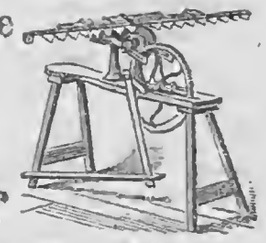
HORSE RAKE,

which does not scratch the ground and dust the hay. **Best Rake made.** Buy no other rake and have clean hay.

New **Victor Lever Feed Cutter.** *Largest and Best made.* The best **Champion Vegetable Cutter** made. Cut a bushel of potatoes in 23 seconds.

JOHN R. WHITTEMORE, Chicopee Falls, Mass.

Farmers' Favorite Emery Grinder



PRICE, $8.00.

FOR MOWERS AND REAPERS.

The only practical Sharpener in the market. Even bevels and perfect-cutting edges insured. Saves three-fourths of the time and labor of grinding, and reduces wear and tear upon the Mowing Machine. Only one person required to operate it. It has received the highest award of the New England and other Agricultural Societies wherever exhibited, and is indorsed by hundreds of Farmers.

A responsible party wanted *immediately* to manage the sale in every town. Send for Circular and terms.

Wood Manf'g Co., 12 Front St., Worcester, Mass.

PORTER'S HAY-LOADER

In the Field. The Team Lifts the Hay. Ask your dealer for descriptive circular, or send stamp to J. E. PORTER, Ottawa, Ill.

The Anti-Friction Hay Carrier,

elevates perpendicularly, and conveys horizontally any desired distance. **Many Thousands in Use.** The cheapest, strongest, most convenient, and durable Carrier made.

THE NOYES GRAPPLE FORK handles fine, coarse, or loose hay; is cheaper than a harpoon, easy to handle, strong, durable, and guaranteed the best Horse Fork made.

Send for sheet containing 24 ENGRAVINGS AND DRAWINGS—designs for tracking and arranging barns, bill of lumber, and full details for making Field Stacking Frame, etc., etc.

THE
RURAL NEW-YORKER.
PUBLISHED EVERY SATURDAY.

Address
RURAL PUBLISHING CO.,
78 Duane Street, New York City.

SATURDAY, MAY 17, 1879.

TO EVERY READER.

We respectfully and urgently call the attention of our readers to the *necessity* which exists that they should address their communications to the Editors or the Publishers of the Rural New-Yorker, if they would insure prompt responses. Letters addressed to individuals are often delayed in this office for weeks. Mr. Moore, to whom letters intended for us are still occasionally addressed, has had no connection with this journal for several years.

CAPITAL, CASH AND CREDIT.

No business can be carried on without capital. A laborer works with his hands; when he procures a tool or an implement he at once makes use of capital which is literally the accumulated labor of himself or others, or rather the product or result of it. In business one has fixed and floating capital. The fixed capital is that which remains year after year permanently invested; it may be in the shape of a house, a farm, a ship, or a railroad. Floating capital is that which is always changing its form; it may now be a pair of horses, a mowing machine, cows, sheep, seed, fertilizers, money spent for wages, or merchantable goods of any kind. This kind of capital is more productive than the other, because it can be turned over oftener, sometimes several times in a year, and if well used may bring a profit every time it is returned.

The floating capital of the farmer exists chiefly in the shape of stock and implements. When in the form of implements, it may be made the most productive. For instance, a seed drill costing $80 or $90, will sow 100 acres of wheat in ten days, and will save not only 50 bushels of seed in doing this work, but will do the work better than if done by hand, and save at least one dollar per acre in labor. So that the investment of $100 in a seed drill can be made to return 150 per cent. profit in one year. A mower will cut five to ten acres of hay in one day, at a cost of only one-fourth of the labor of a man with a scythe; costing $75 or $80, the expenditure will be repaid in the cutting of 40 acres, which can easily be done in one week. A fodder-cutter costing $25, will cut the feed for ten or twenty cows, and will save one-fourth of it. It may easily save five tons of hay, straw, or fodder in one year, and will thus pay 100 to 150 per cent. It is the same with the whole category of farm machinery; and a farmer cannot use his capital in any manner that is so profitable as this, and knowing this, he is frequently tempted to purchase implements and machinery on credit, hoping to pay the bills out of his savings. But unfortunately there is nothing so dear or demoralizing as debt, the more especially with regard to floating debt. Debt is in any respect something to be avoided. If a farmer has a hundred bushels of wheat in the granary, or a cow or two that he can spare, he had better turn these into cash and buy what he wants than to buy on credit. "Easy come, easy go," is a true old adage, and a thing bought on credit begins a habit of buying on credit, until the purchaser is tied up and struggles like Laocoon in the folds of the gigantic python. The old fable is even more apt: for the victim of the deadly serpent was enfolded along with his sons; and the family of the involved debtor shares his fate with him.

The use of labor-saving machinery is imperative. We cannot make our farms pay without them. But, as has been shown heretofore, in buying these, or anything else, on credit, we buy them very dearly. The extra price paid in this way, as we have hinted, is by no means the greater burden on the farmer. He pays again and again for the mistake of going into debt. He lays a burden upon his mind which paralyzes his energy. The free man holds up his head and encounters his daily labor with elastic energy. His step is firm; his heart is light, and he is full of vigor and hope. But the slave never feels as a free man; he drudges, not works; hope and he are strangers to each other, and he is careless of results. The involved debtor is a slave and is bound as with a chain. He looks ahead, not in hope, but in dread. He fears disaster before it comes upon him. A threatening outlook for his crops is a miserable nightmare to him, which "murders sleep" and haunts his waking hours. The free man may whistle down his care, and if short crops threaten he is thankful that he has enough and to spare, and looks hopefully for another year. The wife and children, sharing the husband's fortune in the one case, suffer every day; but in the other case may sing and laugh while the skies lower and the rains fall in the midst of harvest.

This is one way in which the farmer in debt pays an extra price, and it is without doubt a bad way. In another way he pays. He gives a note due in a year, trusting to favorable crops for the means of paying it. If there is any way by which a period of time passes more quickly than another it is to have a note coming due. Before one thinks, the day is at hand. If not prepared for, it is renewed; perhaps it is in the hands of a grasping broker who exacts usurious interest as "a shave." By-and-by the original amount is doubled. This happens too frequently. Perhaps in time it is paid through much pinching and saving, but at what a sacrifice of money and happiness! This is another way in which the farmer in debt pays an extra price for his purchase. We need not lengthen out the homily. Many of of our readers know too well how it is themselves. The cost of it all is as the physical reaction after an active stimulant and leaves the victim poor and depressed in far greater proportion than he had been elevated by the enjoyment of possession and use.

"But must one never go in debt?" We do not say that. But we say deliberately *do not buy anything on credit.* Borrow the money if absolutely necessary, on a sufficiently long time, and buy on the best terms. You can save the interest on the money in purchasing for the cash. The seller will meet you with eagerness, if you show him the cash, and will hesitate long to let you go without buying. The positions are reversed. The man with the cash *confers* the favor; the man without it, *asks* it. Buy, borrow and use with judgment; not recklessly. Then your indebtedness may become a stimulus to economy and energy, and the man who incurs a debt after due deliberation and foresight, may be as a boat ballasted and made to ride safely in rough waters. John Johnston, the model farmer of New York State, when a young man, borrowed money to buy land, and borrowed more to drain it; but having the shrewdness and skill to succeed, he laid in this way the foundation of as grand a success as the history of agriculture affords. But he bought his tiles and materials for cash, and had no floating debts to worry him day by day.

Spending money is as the sunshine of a man's life to most people; pay day is the rainy day against which he must lay up and provide. To have rainy days ever occurring, as with small and growing debts falling due this month, and the next, and the following, will cast a damper upon any man. Believing, as we honestly do, that it will pay, indeed that it must pay, to use every mechanical facility for economical work upon the farms, we do not hesitate to advise our readers to borrow money to purchase needed implements and machines, so that they may pay cash for them, and buy on the lowest and best terms, provided they have sufficient time wherein to meet their liability, and have a fair prospect of succeeding in their venture.

WHY IS HEN MANURE SO GOOD?

The answer to this question is full of instruction in divers ways. The food of fowls while at large (and also when confined, if they are to continue healthy), consists of seeds and animal substances. They catch vast numbers of insects and insect larvæ. Indeed, for this purpose one chicken is worth a hundred robins or sparrows, and they seem particularly to like the very insects that are most harmful to crops—putting them into *their* crops upon the homeopathic principle, perhaps. This rich, concentrated diet makes rich, concentrated manure—which is the first lesson worth any farmer's while to ponder upon. Rich food judiciously given, not only keeps our stock in good order and in a thrifty state, but it makes rich manure. This is an object to be kept in mind in choosing between different feeding materials. Our farmers do not use enough of such feeding stuffs as are very rich in plant as well as animal food. Wheat bran and oil-cake are made extensively, and fed out but little, in America. The English buy the latter, freight it 3000 miles, and feed it to profit for the production of staples that must be sold in a free market in competition with our own. They get the most of their profit in the manure. How many of our farmers give this point due consideration?

Then again, fowls are so organized that the evacuation from their kidneys, in a semi-solid state, mixes with the dung before it is dropped, and is thus wholly saved for fertilization. Chemistry assures us that more than half (and the best half), of the plant-food in the excrement of all domestic animals is to be found in the urine. Now, if our cows and horses were like our hens, in this respect of passing off their renal secretions as a semi-solid in connection with their dung, our stable manure would be found vastly superior to what it proves to be as we usually see it. Most of our farmers make hardly any effort to save the liquid manure, and of those who do the success is not always what it should be, by lack of proper knowledge, or proper conveniences.

Col. John B. Mead, the State Superintendent of Agriculture in Vermont, recently stated at a public meeting that in five years after he had made suitable provision for saving the urine of his stables and applying it to the land, the crops of his farm were doubled. A doubled crop means a doubled power of carrying stock, and with a doubled herd comes again a double quantity of fertilizing material. What a vista of progress is here opened to the ambitious farmer!

These two lessons, then—the value of high feeding for the production of rich manure, and the necessity of saving the liquid as sedulously as we save the solid manure—are pressed home to us by what we know of the value of hen manure and of the "why" of it. There can be no mistake about it. Every thoughtful farmer must see the profit there is in these lessons, if he will only reduce them to practice. They shine like beacon lights on the path of agricultural progress.

ARTIFICIAL FOODS.

Millions of dollars' worth of so-called artificial foods, cotton seed-oil meal, linseed oil-meal, pea-nut meal and other refuse materials are sent to Europe from this country every year. This is as though we furnished our enemy with a sword wherewith to slay us. We supply our competitors with the most effective means for meeting us in competition. We give our adversaries material help in doing this. Of these foods they make meat, butter, cheese, grain, grass and manures to make more of these; all of which, directly or indirectly, we are making and selling in the closest competition with them. In a ton of cotton-seed meal, there are 500 pounds of beef, as much cheese and as great a value of manure as the meal costs to purchase. Linseed-oil meal is equally as valuable. By using these ourselves, we should secure the benefit of all this production, while we should prevent its use by our competitors in business. Some may say we cannot afford to use these. This excuse is obviously groundless, when we see that they are purchased by English farmers who pay rentals for their land of $10 to $50 per acre yearly, and pay the cost of freight from our shores across the Atlantic upon these feeding stuffs, with the expenses and profits of at least two intermediate dealers, and yet use them with sufficient advantage to make them an object that is earnestly sought after. The fact is, by neglecting these home-made products, we are throwing away an immense advantage which cannot amount, in a money value, to less than a hundred million of dollars annually.

EARLY vs. LATE-FLOWERING MAGNOLIAS.

Most people will acknowledge, if they will be frank in the matter, that they object to Chinese Magnolias, so-called, on account of their peculiarity of blooming before the development of leaves. We miss the foliage which attains such beauty later, and while we would not sacrifice the wonderful beauty of the flowers in early spring, we cannot help wishing that fine foliage might go with such fine flowers. It is probably for this reason that the late-flowering Magnolias are so popular notwithstanding the comparative inferiority of their bloom. That of M. cordata is yellow, of medium size, attractive, but not extraordinary in any way. The same may be said of M. glauca, except, perhaps, that it is sweet-scented, while the flower of M. macrophylla is noteworthy only for its immensity. What we want is an attractive sweet-scented, good-sized Magnolia flower that develops at the same time as the leaves. M. hypoleuca is such a species, as well as one other variety not yet named. Yet so few of even the first of these Magnolias have been offered to the trade that it is not strange they are overlooked. It behooves us, however, to seek such plants in order to give our lawns the most rich and varied attractiveness, and we are happy to note the increasing taste for extended collections of hardy trees and shrubs.

Square Bolts.—Why will implement-makers evoke maledictions and cause farmers to be profane! Surely these latter have enough of trouble of all kinds that cannot be avoided, to be pestered with the abominable nuisance of round-shanked, and what is even worse, round-headed bolts, in their machines. As a matter of course, the nuts rust fast and when a bolt is to be removed, it turns in the hole. Then two wrenches held by two persons must be used and the ill-used farmer finds most frequently that the bolt has a round head that cannot be held. Then it is sometimes well for the maker of that bolt that he is too far away to hear the fluent remarks which fall from the irate man. Why cannot the manufacturers use square bolts in square holes in all tools, implements and machines?

BREVITIES.

Buy for cash.

Harris goes back on the pig!

Duncan is the first of our Strawberries to bear blossoms.

A writer in the London Garden finds that the cracking of pears is prevented by grafting more than one variety on the same stock. He is very positive about it.

Commissioner Le Duc is more hopeful of corn and sorghum than of beet roots as the plants which are to aid the success of our sugar producing industry.

The farmers of our neighborhood take much trouble to collect the leaves of the Skunk Cabbage (Symplocarpus fœtidus), to feed their pigs at this season of the year.

Tree Peddlers.—Trees of all sorts are now being sold from street stands about the city. Some of these trees are kept on hand for three weeks with their roots more or less exposed.

Last fall the best authorities advised the late sowing of wheat to avoid the ravages of the Fly; this spring farmers complain in in "Everywhere," that late-sown wheat is much inferior to early-sown.

Mr. Thomas Hogg in the Gardener's Monthly explains to Professor Sargent the difference between "introduced" and "first introduced" and calls attention to the fact that Cercidophyllum is spelt Cercidiphyllum is Miquel's Floræ Japonicæ.

Let every one of our young friends who loves plants join our Youth's Horticultural Club and send in his name to Uncle Mark. Let parents carefully read the leading editorial of the Rural New-Yorker of the 3d inst. We are raising hundreds of plants to distribute among all good members another season—perhaps in the fall.

There is a time in the life of every child when he or she must have a garden to take care of—to own. It is one of the noblest intuitions of childhood. The parent who is unwilling to aid its development, neglects a duty. Better encourage gardening in a willing pupil than constrain a child to practice from two to four hours a day upon the piano.

Mr. Beecher says, in the Gardener's Monthly, that he has fallen in love with Tom Thumb Arbor-vitæ for borders. He says: "It is hardy, dwarf, bears clipping well, is beautiful in winter, and, if not in too rich soil, keeps its fine foliage without apostatizing to the original species." It *does* bear clipping well, but is far from hardy, being always injured and often killed in this latitude, which is forty miles south of Mr. Beecher's country residence. It must be confined to a foot in hight, or the feathery foliage above that becomes as coarse as that of its parent. Our opinion from six years' experience is that it is a worthless, nondescript plant.

Apparently Winter-killed Trees.—Do not uproot too soon seemingly winter-killed trees. Many a Rhododendron has been thrown away, because its leaves were brown, that with a little patience would have put forth new and vigorous foliage. Ordinary evergreens recover more slowly, sometimes only in years, if they recover at all. In any case, it is always wise, if you value the tree, to wait until at least the middle of June, so that you may note its behavior during the growing season. As a rule, however, an evergreen that has lost all its leaves seldom, if ever, recovers, Rhododendrons and one or two other plants excepted. Removal of dead wood, of course, assists the plant to recover.

Miner's Grapes. As reference to our Query column will show, we are in receipt of many inquiries respecting the seedling Grapes of the late Mr. T. B. Miner which were figured in the Rural September 30, 1876 and have since occasionally been referred to. Mr. Miner a year before his death sent us his most valued varieties to be tested. As soon as they fruit, we shall be able to tell our inquiring friends all about them. The engravings above referred to were made from specimen bunches grown upon his grounds. The stock of these Grapes, selected as we have before stated from 1500 Concord seedlings, is now controlled by Mrs. T. B. Miner of Linden New Jersey who would, no doubt, answer all pertinent questions regarding them.

Literary Miscellany.

SOWING THE TARES.

A PRISONER in the penetentiary, who heard Mr. Moody's remarks last Sunday, retired after the discourse to a cell and soon emerged with verses hastily written in the meantime, which had been suggested by the discourse, and handed them to Mr. Moody, who, in the afternoon, had them read at the Maryland Institute, as follows:

Sowing tares, when it might been wheat,
Plucking the bud of life's wreath all complete,
The night sinks down, amid darkness and fears,
While we are so cruelly sowing the tares.

Sowing the tares of malice and spite,
Words of black import—Plutonian night;
We might have sown roses amid life's sad cares,
But we turned from their beauty to sowing the tares.

Sowing the tares—how dark the black sin,
Mingling a curse with life's sweetest hymn;
Heeding no anguish, no piteous prayers
While we were so cruelly sowing the tares.

Sowing the tares to bring sorrow down
That robs of its jewels life's fairest crown;
Turning to silver the once golden hairs
That grew whiter and whiter as we sowed the tares.

Sowing the tares under cover of night,
When we might have sowed joys cheery and bright.
Oh! heart, turn to God, with repentance and prayers,
And plead for forgiveness for sowing the tares."

AN UGLY GIRL.

(Continued from page 286.)

CHAPTER XII.

THE RESULT OF IRENE'S LETTER.

"THAT'S just like you!" observed Mrs. Estcourt, fretfully. "You always do side with that girl, no matter how rebellious and troublesome she may be. It's very hard upon me."

"Why did you leave her letter unanswered?" asked her step-son, sternly.

"I do not choose to be questioned in this style, Noel!" was the dignified reply. "It's very impertinent of you, and submit to it I will not. But if you must know, Irene wrote for money, and I had none to send her."

"My purse is—is somewhere—in one of my pockets, I suppose. Pray search for it, and let her have whatever it contains."

"I have already had that trifle, and spent it," Mrs. Estcourt was obliged to confess. "You must have known that I couldn't stay in such a house as this without getting myself another dress or two."

"And the children wanting food!" Noel reminded her.

Mrs. Estcourt burst into tears, but laid all the blame on her daughter's bad management, and summed up by declaring Irene was behaving shamefully.

"In refusing to be neglected in this cruel manner?" demanded Noel, so passionately, that the sound of his voice penetrated to the adjoining room, and brought in Hillian Gray and the nurse to put an end to a conference that was disturbing him to such a dangerous degree.

"Don't find fault with me!" cried Mrs. Estcourt, in reply to their reproachful looks. "I could not prevent his exciting himself. He knew the state into which I should be thrown by his violence; but he is like the rest. Anyone can see that my children have no consideration for me."

"One moment!" gasped Noel, laying his hand on the nurse's arm, as she would have taken his step-mother away. "Miss Gray, will you do me a great favor? Will you see that a carriage is procured to take Mrs. Estcourt to the station in time for the next train to London? She must return there immediately."

"And leave you, Noel? How can can I? What would people think of me?" she asked, helplessly.

"Don't study appearances, nor worry me with arguments; think of your little ones, and go. Good heavens! woman, how can you be so utterly forgetful of their claims upon you?"

He had never accosted her in such a strain before, and Mrs Estcourt began to cry and declare that he was very unfeeling to speak to her so rudely.

As to the children, she was sure—as she had told him again and again, only he would not listen to her—that Irene must have managed very badly, and—

But nurse Brown had by this time led her to the door, and the rest of her self-bewailings were spoken outside it.

Hillian was, however, terrified at the state in which she found Lord Carlsforde, and acted with a promptitude and good sense that did much towards reclaiming him.

"Pray lie still; the wish you have just expressed shall be obeyed. I will neither forget nor let anyone else do so, that by Miss Carlsforde's commands you are to be considered master here as long as she is absent. Mrs. Estcourt *shall* be ready for the train, and shall go to town by it, or my name is not Hillian Gray! Will that content you?"

He nodded, and she glided away; her aunt who had been hovering near the door, trying to glean what was amiss from their faces, instantly taking her place; but Noel could not obey Hillian's injunction and compose himself till Mrs. Hurst, from her post by the window, announced that his step-mother was just departing, and that Hillian herself was driving with her to the station. Then a regret that he had been betrayed into speaking more sharply than dutifully mingled with his fears that she might reach home too late to prevent the flight of Irene, the self-willed mad-brained girl, whose eccentricities had always been a source of anxiety to him.

He began to chafe at his own inactivity. There were so many duties unfulfilled which only he could perform: there was Miss Carlsforde to be tracked, for Mr. Whitely was not half active enough in the matter to satisfy his impatient client; his own affairs to be settled and put in train for his departure from England; Irene and the little ones to be placed in better hands than those of their improvident, selfish mother; yet here he lay, unable to do anything but chafe at his own weakness, and with the prospect of being just as helpless for some time to come.

He was still brooding over his troubles when Hillian Gray came back, bringing with her a lovely bunch of wild flowers, and such radiant looks, that Noel was insensibly soothed before she began to speak. What arguments she had used to prevail with his step-mother he could not guess; but that they had been conclusive was evident.

"Mrs. Estcourt had quite recovered her spirits when she started," Hillian assured him; "and she had almost forgiven you for sending her away so cavalierly. In fact she said, as she bade me adieu, that it had been a great relief to her when you consented to let her go, as between her longing to be with her children, and her fears that you would think her unkind if she proposed leaving you, she had been in a terrible dilemma."

"If she is but in time," said Noel, uneasily. "Irene is headstrong enough to carry out a rash resolve upon smaller provocation than the present one."

"Why anticipate trouble? Mrs. Estcourt has promised to telegraph as soon as she arrives at her own home. Are you fond of your half-sister, Lord Carlsforde?"

"Fond enough to feel very unhappy about her now I know she is on the verge of committing a rash act, which I cannot exert myself to prevent."

"Then you will forgive me for dispatching a telegram to Miss Estcourt, assuring her that her mother was hastening to her. My aunt, whose deafness does not prevent her from exercising her wits for the benefit of others, suggested it, and I acted upon the suggestion."

"It was very kind, very thoughtful," cried Noel; but, without waiting to hear his thanks, she went on:

"And you will be pleased to hear that as Mrs. Estcourt cannot herself remain with you, she proposes to send this young lady to Carlsforde."

"Send Irene here! She will worry you to death!" was Noel's impulsive exclamation; but Hillian's gay, little laugh was so reassuring, that he reconciled himself to the threatened infliction.

After all, Irene was always more endurable than her mother, and she would be safer here than with Mrs. Estcourt, who, when free from the controlling influence of his presence, was apt to keep up a perpetual "nagging" that made her high-spirited daughter utterly unmanageable. This thought proved so consoling, that Noel was able at last to look forward to the coming of his half-sister with something like pleasure.

Irene Estcourt's arrival took place, however, in rather peculiar style. Hillian Gray had been taking the exercise on which her aunt insisted, at the close of a pleasant but chilly afternoon, when she was startled by a female figure suddenly emerging from the thick belt of evergreens surrounding the lawn, and abruptly accosting her:

"Do you belong to the house?"

"I certainly am living there," said Hillian, doubtfully regarding the speaker, whose attire was concealed by a very shabby waterproof-cloak, the hood of it being drawn over her head. The face beneath the hood was the fair and rosy one of a girl younger than herself, and would have been pretty, but it was smudged with the tears that had been wiped away with a hand which bore the marks of having wielded at no distant period a blacklead-brush, while a black from the engine of a railway-train had lodged on the extreme tip of a very piquant little nose.

"Oh! you live at Carlsforde, do you?" queried the new-comer, after indulging in such a long and comprehensive glance that at last Hillian shrank from the prolonged gaze of the black eyes that contrasted so oddly with the fair hair and pink-and-white complexion. "Then take me there, will you? I'm Noel's—Lord Carlsforde's sister. Slip me in through a side door, if there is one."

"Is it Miss Estcourt to whom I have the—the pleasure of speaking?" asked Hillian, when she had overcome her astonishment.

She was answered with a nod and a sigh of weariness.

"Yes, it's me, and here's my bag; my arm aches with carrying it. You're not one of the housemaids, eh? You'll not be offended with me for asking."

"My name is Gray," was the quiet response.

"If I wasn't just beginning to think so! Then you're the young person who takes too much upon herself?"

"Is that Mrs. Estcourt's report of me?" queried Hillian, dryly.

"Yes; but then no one takes any notice of what ma says, so why should you? Where's the side door? My feet ache so I can't walk much farther!"

"Why were we not apprised when to expect you, that the carriage might be sent to the station?"

"Do I look like carriage company?" asked Irene. A question so difficult to answer, that Hillian passed it by, and asked another:

"Have you made the journey alone?"

Irene nodded again.

"Third class; and hadn't money enough to carry me all the way, so I had to get out about four miles from Corby, and walk the rest. Look at my poor shoes! they were bad enough before I started; and now they're in holes—actually in holes!"

"I cannot understand—how Mrs. Estcourt could let you come in this manner," Hillian was about to add, but checked herself.

However, Irene comprehended her meaning, and promptly gave the required explanation.

"I'll tell you how it was. Ma wanted to keep for herself the money she brought from here. Who gave it to her? I don't know; do you?"

Hillian crimsoned, but was silent, so Irene went on.

"Well, and so she wanted me to borrow some of —of never mind whom; but I wouldn't. Never no, never; and so we had a great quarrel, and mamma called me names—but that I didn't care for—and then she said Noel was dying, and that I was an unnatural sister not to want to see him again; and that"—here the excited speaker had to struggle with her sobs—"that made me come off in the middle of my work. You see the servant left us suddenly, and I've had to do everything. I'd have walked all the way, rather than have missed seeing Noel again, for he's the best, the dearest of brothers. Is he really dying?"

"No, no: he is recovering, though very slowly. But, my dear girl, you don't mean to say that you came away without Mrs. Estcourt's knowledge?"

"Oh! no. I put my head in at the door—she always goes to bed after anyone has offended her—and said, 'Good-bye, ma; I'm going to Noel. Wish me a pleasant journey!' But she wouldn't, so off I came."

"And borrowed the money, after all?"

"Not I, indeed! Noel detests anything of the kind, and so do I. I knew Matilda Jenkins coveted my new hat. Noel chose it; and it had the loveliest long, drooping ostrich feather you ever saw! I wouldn't have parted with it only for his sake. But I offered it to her for half the cost, and came without one. I suppose I look a regular guy, don't I?"

"What would you have done if Miss Jenkins had declined the purchase?" inquired the amused Hillian.

"Sold my hair," said Irene, pushing back her hood, and shaking down a mass of pale-brown tresses. "It's more trouble to me than it's worth. Noel does fuss so about my keeping it in nice order."

"I do not wonder at that; it is such lovely hair."

"Is it?" queried Irene, holding up a tress, and surveying it critically. "Ma says it's not at all a fashionable color. Oh! how tired I am! and so awfully hungry!"

"Let me take you to my room," said Hillian, kindly. "There you can rest and have some tea."

"Not till I have seen Noel," was the emphatic response. "Ma distinctly said that he was dying, and though she may be wrong—she often is—I don't feel as if I could enjoy anything—no, not even thin bread-and-butter and potted ham—till I have satisfied myself that he is as well as you describe."

"You are quite right to be anxious to see your brother at once," Hillian observed; "but don't you think he would feel troubled if he saw you in this plight?"

A remark that made Irene glance at her dusty wrapper and her dirty hands, inquiring, doubtfully:

"Am I so very untidy? But what matters? Noel knows me of old. He would scarcely recognize his harum-scarum sister if I was as prim and neat as you are. Do take me to him at once! How came he to be hurt so badly? I know very little about it, for ma hates to be bothered with questions. Wasn't it in trying to save that troublesome Miss Carlsforde, who turned up all in a sudden to be a nuisance to us? Only to think of poor dear Noel nearly losing his life for a girl who had robbed him of all his property!"

"Hush!" said Hillian, in troubled tones. "Remember that you are in her father's house—the father who gave her his all out of the depth of the love she never succeeded in winning till the hand of death was separating them. Pity her, Miss Estcourt—pity her a little, for there is not a creature on the face of this earth more unhappy amidst her wealth than Ada Carlsforde."

Awed by the seriousness of the speaker's manner, Irene said no more, but followed her through the conservatory, by means of which they entered the house unobserved. From thence they passed across the wide hall, and up the principal staircase to the corridor, into which opened the guest's chamber, the richly-furnished suite of rooms hastily prepared for Noel's reception.

But when, with a reassuring smile, Hillian paused at the door, and turned to her companion, she had disappeared.

CHAPTER XIII.

NOEL GROWS IMPATIENT.

In a dark corner at the foot of the staircase, crouching on the floor, Hillian Gray found Lord Carlsforde's half-sister. She had been suddenly seized with an unconquerable dread of the scene she expected to witness. Noel, no longer strong, healthy, and smiling, but wrapped in surgical bandages, hollow-eyed, and ghastly, perhaps unable to recognize him when she approached him, was the picture her imagination drew; and it filled her with such horror that she was now as unwilling to behold him as a few minutes earlier she had been anxious to do so.

It was not till patient Hillian had repeated again and again her assurances that there was nothing painful in her brother's appearance, that she agreed to be taken to him; and when she did consent to rise, it was only to drop back in her former position, and quietly faint away. Here was the explanation of the fit of nervous terror at which Irene herself had marvelled. Long abstinence from food, and the fatiguing walk, had been too much for the strength of the ill-fed, rapidly growing girl; and she did not regain her senses till after she had been conveyed to Hillian's bedroom.

Irene's delight, when admitted into Noel's presence and warmly thanked for coming to him, would have risen to an exuberant height, if nurse Brown had not been there to check it. She was eager to be allowed to wait on her brother, and never happier than when permitted to be of some service to him; but her zeal outran her discretion, and, as she upset or threw down everything she came in contact with, it was considered only prudent to forbid her free access to his chamber till he was stronger.

Irene penitently admitted her awkwardness, endured nurse Brown's lectures good-humoredly, and set herself to work to find amusement for the hours that must otherwise have hung heavily on her hands. Fortunately for Hillian, to whom she had thought proper to attach herself, she was easily pleased, and, as soon as she had received permission to inspect the whole house, commenced the tour of the principal rooms, dragging Mrs. Hurst with her to assist in her explorations.

The result of these voyages of discoveries was always imparted to Noel in the evening; and though one day his little sister would come to him full of the wonders of a cabinet of shells and corals from the Pacific, and on the next was equally engrossed in the illuminations of some quaint old missal, she always provided the little party that assembled at twilight beside his couch with pleasant topics of conversation.

"It's regularly jolly here!" Irene declared. "If Noel were well, and mamma would not fidget and expect such long letters, and the fullest answers to all her tiresome questions, and I could make myself quite easy about the children, I shouldn't care if I never left Carlsforde again."

But Noel, though he smiled at her enthusiastic speech, could not think as she did. When alone he often ruminated on the curious chain of events that had occurred to detain him in a house he had been anxious to turn his back upon for ever. At the present time he was the real though unwilling occupant of Carlsforde Park; for its young mistress neither answered the advertisements inserted by his request in all the leading newspapers, nor had Mr, Whitely succeeded in obtaining any clue to her whereabouts; while Mrs. Hurst, if the subject was mooted to her, went off into such long tirades concerning Ada's obstinacy, and the trials she had undergone with her wilful pupil, that Noel, for his own comfort's sake, grew careful not to advert to it.

More provoking still, Miss Carlsforde's guardian, a certain Major Blenkinsop, then in the West Indies, to whom, at his instigation, Mr. Whitely had written and acquainted him with his ward's disappearance, addressed his reply to the young peer, and empowered him to act as his representative.

"I am endeavoring to settle the affairs on a widowed cousin," he wrote, "who has large sugar plantations in this island, and am so harassed with conflicting claims and entangled accounts, that I really cannot be of much use to you. So, taking into consideration that your lordship is on the spot, and will doubtless eventually wed your naughty runaway cousin, I don't think I can do better than beg *you* to attend to all such affairs—repairs of the house, appeals from tenants, etc.—as present themselves to your notice. I should be sorry to think that anything is neglected through my absence from England, but feel sure, my dear lord, that I may rely upon you to take care that the orphan child of my old friend does not suffer by my inability to hasten to her."

It seemed as if the fates were conspiring to force Noel into relations with the heiress, and he was not altogether sorry that the state of his health afforded him an excuse for delegating all the questions that were referred to him for decision to Mr. Whitely.

It chafed him to see that Hillian Gray did not approve of this, and delivered his messages or wrote the notes he dictated with unfeigned reluctance.

"I wish we could reconcile you to your imprisonment," said Hillian, wistfully.

"Nay; would you not despise me if I were content to endure it, while my work is waiting for me? Yet do not imagine that I am unmindful of the kindness I have received since I have been here. I shall often recall the days spent with you and your aunt. Do you intend to remain at Carlsforde, Miss Gray?"

To his surprise, Hillian was slightly disconcerted by the question.

"You forget my aunt's infirmity. While she is so very dependent on me, how can I leave her? While she persists in thinking that she ought to stay, I must try to be contented to do so too."

"I do not like to question you too closely respecting Miss Carlsforde," Noel said, after a pause; "because you are so loyal to your friends, that I believe you think you ought not to give one any information that might lead to the discovery of the lost damsel. But I should feel easier in my mind if you could give me reason to hope that she is with some friend or other."

Hillian mused.

"I never knew her to have any friends but my aunt."

"And yourself—I am sure Ada Carlsforde has not a firmer, truer one than you."

"Do you think so?" she answered, with unusual bitterness in her accents, "or do you say this because politeness seems to demand it? In either case you are wrong. My likes or dislikes—my hate or esteem are of little consequence to any one; for I am of no account to the world. Yet I cherish them as strongly as more fortunate people, and I hate—yes, I hate the name of Carlsforde! I wish I could go where I may never hear its odious sound again!"

And then averting her crimson face, she hurried away, leaving Noel to muse over this revelation of the life she must have led as the dependent of his unknown cousin. To what capricious usage must she not have been forced to submit, before the gentle, sweet-tempered Hillian was taught to detest the very name of her employer!

CHAPTER XIV.

ENGAGED.

Irene's letters from home—spider-like scrawls, full of complaints of Mrs. Estcourt's domestic trials with those dreadful children, and the servants, who were equally unmanageable—were generally read in haste, and tossed to Noel for him to dictate the reply, or write an answer himself when he felt equal to it. But one morning Mrs. Estcourt's epistle was perused with more than ordinary care, and slipped into the reader's pocket from whence it was produced when she seated herself in the twilight on the low stool beside her brother's sofa.

"Noel, there's something I haven't told you yet," she cried, abruptly. "I am engaged."

Hillian started from a reverie, and looked so surprised, that her aunt saw it, and inquired the cause.

"Indeed!" exclaimed Noel, in a serious tone. "When did this arrangement take place? and why was I kept in ignorance of it?"

"Well, it was just before you came here, and ma said you were not to be spoken to about it till you had settled your own affairs. Of course, we then thought you would be able to give me a dowry and a *trousseau*. That dreadful Miss Carisforde has spoiled all our plans, hasn't she?"

"Dont chatter of things that you do not understand," said her brother, sternly; "but tell me the particulars of this precious engagement."

"I am not going to be scolded when I am not in fault," cried Irene, pouting angrily. "Ma knows all about it; and I am her daughter. If she sanctions my marriage, you have no business to object to it. Girls as young as I am marry every day, don't they? I am very fond of you, Noel, and I submit to your lectures like—like an angel; and I can't let you spoil my chance of making a good match with your scruples. Ma says I oughtn't; and I wont!"

"I think we had better leave Mrs. Estcourt's name out of our discussion," said Noel, striving to curb his annoyance at this exposition of Mrs. Estcourt's sentiments. "Will you tell me who the gentleman is? and how long you have known him?"

The answer was rather an incoherent one.

"Matilda Jenkins' cousin; and it's a twelvemonth and more; though, as he never took any notice of me, and even assured her that I was too loud for his tastes, I considered him a regular prig, and gave her leave to tell him so. His name, did you ask? Clement Dunforth, the young lawyer. Oh; Miss Gray, he is such a handsome man! Not so tall nor broad-shouldered as Noel, but ever so much better-looking; and we're to be married, directly. Well, what now? How disagreeable you are! If I had heard that you were going to be married, I should have said something civil, not glared and grumbled as you are doing."

"The cases will bear no comparison. You are a child, and a very absurd one. Mrs. Estcourt must have been——"

He stopped; but Irene coolly finished the sentence for him.

"*Mad*, when she gave her consent! Fiddle-dedee! She cannot manage me herself, and she would be only too glad to make me over to some one who can. Besides, Clement Dunforth isn't the sort of fellow to whom anyone would like to say 'No.' I tried to, for I was rather frightened at first; but he wouldn't hear of it, and when I got used to the idea of becoming a married lady, I liked it. You'll come and stay with me, Miss Gray, when I am settled in a house of my own. I'll have such glorious cookeries, and make cakes and toffy as often as I'm in the humor."

"But my dear Irene, do let us talk seriously!" remonstrated Noel.

"No, thank you; why should we? It's all settled, except the day; and I don't want to be made miserable or preached to respecting my responsibilities. Clem must take all those upon himself. My idea of marriage is to have a prettily-furnished house, all one's own—no little brothers and sisters continually wanting bread-and-butter cut, or falling down and hurting themselves; no one to nag, nag, nag till the sound distracts me—as many new dresses and hats as Matilda Jenkins can boast of, and a gallant, good-looking husband to take me out whenever I ask him. Oh! Noel, it will be absolutely delightful! I shall be as happy as a queen!"

Hillian bent forward and kissed the glowing face of the speaker; but Noel grew graver and more annoyed than before. Why had Mrs. Estcourt sanctioned an engagement entered into so hastily? and why had she kept it a secret from him? His surprise and vexation at the course she had adopted drew from him the question, why were the plans of the mother and daughter revealed to him now?

"As you have kept me in ignorance so far, what is the reason for honoring me with your confidence this evening?"

Irene put up her lip, and slipped her hand into Hillian's.

"Isn't he horrible, Miss Gray, when he takes that sneering tone? I wouldn't tell him another word, only Clement's written to say that he's coming to Carlsforde to see me, and so I'm obliged."

"Then it is to Mr. Dunforth's impudence I owe the confession of your engagement!" exclaimed the angry Noel. "Who gives him leave to come here? You had better write and remind him that we ourselves are only the guests of Miss Carlsforde, and that I consider his proposed visit an impertinence."

"Oh! but I daren't!" cried the dismayed Irene. "Besides, he says that business will bring him into the neighborhood; and if he chooses to take advantage of that and call to see me, Miss Carlsforde would be a disagreeable thing to object to it—wouldn't she?"

This appeal was to Hillian, who promptly replied that her aunt was empowered by Miss Carlsforde to receive and hospitably entertain any relative or friend of her kinsman whom he chose to invite to the Park.

"But this young man is neither!" retorted Noel. "I have met Mr. Dunforth on one or two occasions, and exchanged with him a few civil speeches, but nothing to warrant him in regarding me as more than the merest acquaintance."

"But will you not, for your sister's sake, try to know him better and like him?" asked Hillian, gently.

Noel was silent, for he could not bring himself to accede to this. He knew too well the miserable life Irene led under the peevish tyranny of her mother to be surprised at her readiness to embrace the first opportunity to escape from it; but she was so young, so ignorant, so thoroughly unfitted in every way to take upon herself the duties of a wife, that he felt he should not be justified in furthering such an early and hasty marriage as this would be.

He tried to recall his own impressions of Clement Dunforth, and remembered him only as a reserved, shrewd-looking young man, endowed with none of the social talk and gallantry most likely to recommend him to a girl like Irene. Yet what motive but love could dictate his courtship, seeing that she had no fortune, and was never likely to have one?

Presently he questioned her respecting the position and prospects of her suitor, and was still further dismayed to find that neither she nor Mrs. Estcourt knew much, if anything, concerning them. When he began to express his astonishment that a mother could act with such extraordinary want of caution, Irene grew restive, and angrily interrupted him.

"Oh! Noel, don't fuss so. I suppose we shall do as well as other young couples; and if you must know all mamma said about it, she told me that you would be sure to come round by-and-by, and marry the ugly heiress. Now, don't be cross; I'm only repeating her words; and she added that if you did not marry Miss C., still, as a peer of the realm, you would have it in your power to advance Clement's interests. Get him some berth abroad, will you, Noel? Do, dear! I should so like to go to Paris, or Vienna. Matilda Jenkins says those are the places to see life."

Noel burst into a laugh; but there was not much merriment in it. The more he heard concerning the projected match, the more it provoked and perplexed him. At last he decided to put no obstacles in the way of Mr. Dunforth's proposed visit. If Mrs. Estcourt had been dazzling the young man with false visions of the prosperity to be attained by wedding the half-sister of an earl, it was only fair that he should be undeceived as speedily as possible.

"You can write to Mr. Dunforth," he told Irene, "and say that when he comes into this neighborhood, your brother will be glad to have an interview with him."

"There's my dear old boy!" was the rapturous reply. "And you will be civil to him, and recollect what I said about living abroad, and——"

"Gently, Irene. My first task must be to make Mr. Dunforth understand that he will have nothing to gain by marrying my little sister. If it is not for the mere love of her that he comes a-wooing, the engagement must be nullified at once."

"And I shall have to go back to ma, to be worried into my grave with her ill-tempers and the tricks of those tiresome children," cried Irene, bursting into passionate tears. "I won't submit to it, Noel! I'll elope first!"

"You had better go away till you can behave more sensibly," retorted her brother, restraining his compassion for the foolish child. "I hope, for your sake, as well as his own, that Mr. Dunforth will bring a little more common-sense to bear on the subject than you are evincing. When you have some conception of the solemn nature of the ties you are so eager to enter into, it will be quite soon enough for you to marry."

The severity of this speech made Irene put her fingers in her ears and dart out of the room. Hillian followed to console her, and Mrs. Hurst to have the curiosity satisfied which their perturbed looks had awakened. So Noel was left to his own reflections.

CHAPTER XV.

A MYSTERY.

Irene soon recovered her equanimity, and finding that her brother made no further allusions to the subject of her engagement, she was content to be silent too, and requite herself for her forbearance by drawing such pictures to Hillian of the freedom and pleasure she expected to enjoy, that the latter was sometimes amused at her simplicity; but more frequently inclined to ask herself how the inexperienced girl would endure the realities of married life when plunged into them thus suddenly, and with no wise mother at hand to give her good counsel. Mrs. Hurst, when made acquainted with the state of affairs, shook her head gravely, but proposed to help the little bride-elect prepare herself for her new station. Her offer was gratefully accepted, till Irene found that Mrs. Hurst would have taught her to make and mend her own clothes, and intended to initiate her into the mysteries of house-keeping accounts, besides supplying her with recipes to be copied from her own. Against such teachings the foolish girl unhesitatingly rebelled,

"Why, it would be like serving an apprenticeship—and a hateful one, too!" she exclaimed. "I know when a dinner is well cooked, and when a dress fits, or a hat suits me. The servants and the milliners must do the rest. Why should I meddle with their work? If I am to drudge in the kitchen, and make my own clothes, I may as well stop with ma.

"But if Mr. Dunforth is not a rich man, it is quite necessary that you should know how to economise."

"Nonsense! It is he who must do that," Irene persisted. "If he cannot afford to give me all I expect, why did he ask me to have him; I told him plainly that I did'nt care much about him; but that I should dearly like to have a nice little home and a pony-carriage of my own—my very own. So, you see, Miss Gray, we quite understand each other."

"If she would but take a few lessons in cooking!" sighed Mrs. Hurst, when Irene's decision was communicated to her. "Having been a wife myself, although for so short a time that three days over the two years is exaggerating the term of my wedded bliss, as poor dear Hurst expired within twenty four hours, with no greater warning than 'Martha, I'm going to leave you,' which might have meant that he had made up his mind to try a change of air, his cough being troublesome; but I had quite enough experience to know that no married man is happy whose wife is careless of the gravy and doesn't order appetising dinners."

"Oh! yes; I'll learn to cook, with pleasure!" cried Irene, "Nothing could be more delightful than making tarts and pies—except eating them. I'll begin to-morrow morning."

But it is doubtful whether Irene ever did enjoy the fruits of her culinary labors, for by some heedlessness on her part nothing she attempted proved successful.

Under these circumstances, Irene soon came to the conclusion that she was not born to be a cook, and returned to the more agreeable occupation of turning over the contents of sundry cabinets and cases, in the small room adjoining the library, which the late Lord Carisforde had once intended to convert into a museum. For this purpose he had gathered together a large number of natural curiosities, and though Irene cared for nothing that did not attract her by its beauty, she was sometimes infected by the enthusiasm of Hillian, who frequently joined her in her retreat, and whose deeper reading and more enlarged mind enabled her to see beauties in stones or fossils, or antique marbles, that her companion had carelessly passed over as not worth a second glance.

But Hillian's visits to the museum or library were hurried ones; for, unlike the more idle Irene, she was always fully employed. Although so quiet and unobtrusive, everyone looked to her for aid. Miss Carisforde had enjoined that the poor on the estate should be well looked after. Who was to do this but Hillian Gray? Then there were household cases in which Mrs. Hurst—rendered suspicious of the servants by her deafness, and the housekeeper's unwillingness to take orders transmitted by "a dependent, like herself"—was continually in need of some one to explain or act for her. And who could do this as well as Hillian? Lord Carisforde, too, proudly declining to take upon himself the business matters that cropped up daily, referred them to his little friend Hillian, who must conquer her timidity, and, to the best of her ability, answer letters, hear appeals, and decide how this or that was to be arranged till the lady of the estate could be consulted. Nor was this all. Noel was still the invalid; and, though Mrs. Hurst sat always beside him during the greater portion of the day, and believed that she was a welcome and cheering companion, she did not know how often he feigned sleep to silence her loquacity, or with beseeching looks asked Hillian to read to him or play chess, to relieve the monotony of the hours that hung so heavily upon his hands.

Never more pleased than when she saw that she was of use to some one or other, Hillian Gray contrived to find time for all her occupations, and, however many or urgent the calls made upon her, always took care to be at leisure to sit with the invalid at that twilight hour just before dinner which Mrs. Hurst spent at her toilet. It was then that Noel, wearied with the length of the day, and therefore most inclined to be low-spirited, required a little cheerful society, and Irene was never to be depended on. She would often be seized with compunction for having left her brother at the mercy of Mrs. Hurst so long, and yet let some trifle draw her in another direction before she was half-way to his room.

On the evening before Mr. Dunforth was expected, Hillian's tap for admittance was answered with an eager "Pray come in, Miss Gray, I have not seen the human face divine since luncheon; for Mrs. Hurst has been engaged with the housekeeper upon some important question of pickling or preserving, and no one else has been near me."

"I am sorry," said Hillian; "but when I went to visit a sick woman, whom Dr. Monson asked me to call upon and relieve, your sister faithfully promised to stay with you. Where is she?"

"I am here," exclaimed Irene, coming suddenly into the room, and speaking in such tremulous accents, that Noel inquired what ailed her.

"Nothing—I mean I don't know," was the incoherent reply. "I have been frightened—terribly frightened!"

"My dear Irene, what has alarmed you?" asked her brother and Miss Gray in the same breath.

"Tell me first," she cried, "If anyone—any female, I mean—lives in this house whom I have not seen?"

"Certainly not," answered Hillian, promptly.

"Then it is as I supposed," faltered the trembling girl, hiding her blanched face on Lord Carisforde's shoulder. "The figure I have just seen in the library was not a creature of this world. Don't laugh, Noel; for it was a terrible—terrible sight! Heaven forbid that I should ever behold it again!"

—[To be continued.

RECENT LITERATURE.

The School Garden. By DR. SCHWAB, Director of the Vienna Military Gymnasium, etc. From the German, by Mrs. Horace Mann. New York: Holbrook & Co.

WITHIN a few years the idea has gradually become a conviction in the minds of many educators that the rising generation must be educated by labor as well as study. This, however, must not be made a severe task, but a delight. Froebel, with his kindergarten, gave this thought a great impulse, and now little children in thousands of kindergartens all over Europe and America are trained in their earliest years by organized play and work; and under the hands of good kindergarteners these children are as happy as they can be, and learn to use their hands and limbs and mind in a way that prepares them when older to use them profitably and joyously in the work of life.

"The School Garden" takes up the same idea and adapts it to older children as they are found in all our public and private schools after they have left the kindergarten. In France, Austria and Sweden it is no longer an experiment. In France, we are told, there are already thousands of schools with gardens attached to them, under the care of properly qualified teachers. In Vienna, where Dr. Schwab started the movement, the authorities appropriated land and money rather reluctantly for the experiment, and three years later willingly and enthusiastically doubled the land in order that all the children of the city might come under its cheering, refining, ennobling influences. In Sweden every school has its garden, and the unsightly schoolhouses and yards of America would be looked upon there as a disgrace. In Cambridge, Mass., the experiment has also been tried, and Mrs. Mann writes that it made the children as happy as they could be, and some of the boys even laid down on the grass lawn they had made and actually hugged and kissed it. Dr. Northrop, one of the living educators of Connecticut, and many others are advocating tree-planting by the children of the schools, and thus practically bringing them into contact with Nature and work. Dr. Seguin, one of the foremost of our medical educators, is advocating school gardens with great earnestness. This little book by Dr. Schwab, translated by Mrs. Horace Mann, is intended to awaken an interest in school gardens, and make them in America what they have become in Europe, a highly prized educational force.

School gardens in city and town are destined to be a great educational force in America. This book, full of spirit and enthusiasm, will materially hasten the day.

TREES AND SHRUBS FOR THE LAWN.—There must be a catholic taste shown in selecting plants, if the lawn is to be properly laid out. The tendency to follow mere fancies, or to use only particular and favorite plants, must be kept in strict abeyance. Many and various plants should be employed intelligently. Hardy deciduous trees, shrubs, evergreens, herbaceous and bedding plants,—in short, everything that conduces to the beauty of the lawn, must be united into one harmonious whole. Doubtless there are occasions when a mass of color, obtained by using many plants of one kind, is desirable, but generally a variety of plants and methods of combination is more desirable. The eye thus never becomes sated, and is ever renewing its pleasure. But what is the actual condition of lawn-planting as practiced to-day on myriads of small places throughout the country,—places, moreover, that belong to intelligent people? The entire collection consists frequently of a few fruit-trees in the background, an elm, a Norway spruce, an arbor vitæ hedge, with a bed of the glowing coleus. All these plants, be it noticed, are of the most pronounced and coarsest type. They may be and are valuable in suitable positions or in other combinations, but are decidedly ill-fitted for the interior of a small place, both from the character of their beauty and their habit of excessive growth. We intend no disrespect for either of these varieties, many of their qualities being, in their own way, most admirable; but we do say that if other and good selections were made after studying parks or nurseries, fewer poor lawns would exist. Were this the general practice, the ubiquitous tree dealer, with his wonderful plates of impossible plants, would be forced to seek for pastures new, and leave the field open for intelligent lawn-planting. Landscape gardening (or lawn-planting, which in a sense is a synonymous term, although the latter treats specially of planting, while the former includes also drainage, road-making, etc.) seems very difficult to some, and is practically considered a myth by others. To one class we can only say, practice it yourself and difficulties will soon disappear; it has no arcana into which you cannot pierce. To the other we answer, lawn-planting exists, and has its æsthetic laws, just as taste in general has definite laws.—S. PARSONS, *in Scribner for May.*

OLD TIMES.—A half century ago, a large part of the people of the United States lived in houses unpainted, unplastered, and utterly devoid of adornment. A well-fed fire in the yawning chasm of a huge chimney gave partial warmth to a single

room, and it was a common remark that the inmates were roasting one side, while freezing the other; in contrast, a majority of the people of the older States now live in houses that are clapboarded, painted, blinded, and comfortably warmed. Then, the household furniture consisted of a few plain chairs, a plain table, a bedstead made by the village carpenter. Carpets there were none. To-day, few are the homes, in city or country, that do not contain a carpet of some sort, while the average laborer by a week's work may earn enough to enable him to repose at night upon a spring bed.

Fifty years ago, the kitchen "dressers" were set forth with a shining row of pewter plates. The farmer ate with a buck-handled knife and an iron or pewter spoon, but the advancing civilization has sent the plates and spoons to the melting pot, while the knives and forks have given place to nickel or silver plated cutlery.

In those days the utensils for cooking were a dinner-pot, tea-kettle, skillet, Dutch oven, and frying-pan; to-day there is no end of kitchen furniture.

The people of 1839 sat in the evening in the glowing light of a pitch-knot fire, or read their weekly newspapers by the flickering light of a "tallow dip;" now, in city and village, their apartments are bright with the flame of the gas jet or the softer radiance of kerosene. Then, if the fire went out upon the hearth, it was rekindled by a coal from a neighboring hearth, or by flint, steel, and tinder. Those who indulged in pipes and cigars could light them only by some hearthstone; to-day we light fire and pipes by the dormant fire-works in the match safe, at a cost of one hundreth of a cent.

In those days we guessed the hour of noon, or ascertained it by the creeping of the sunlight up to the "noon mark" drawn upon the floor; only the well-to-do could afford a clock. To day who does not carry a watch? and as for clocks, you may purchase them at wholesale, by the cart-load, at sixty-two cents a piece.

Fifty years ago, how many dwellings were adorned with pictures? How many are there now that do not display a print, engraving, chromo, or lithograph? How many pianos or parlor organs were there then? Reed organs were not invented till 1840, and now they are in every village.

Some who may read this article will remember that in 1839 the Bible, the almanac, and the few text-books used in school were almost the only volumes of the household. The dictionary was a volume four inches square and an inch and a half in thickness. In some of the country villages, a few public-spirited men had gathered libraries containing from three to five hundred volumes; in contrast, the public libraries of the present, containing more than ten thousand volumes, have an aggregate of 10,650,000 volumes, not including the Sunday-school and private libraries of the country. It is estimated that altogether the number of volumns accessible to the public is not less than 20,000,000! Of Webster's and Worcester's dictionaries, it may be said that enough have been published to supply one to every one hundred inhabitants of the United States.—*New Atlantic.*

BRIC-A-BRAC.

THEY MET BY CHANCE.

They met. Deep in the starry depths
Of August's cloudless sky,
Fair Luna trod her golden path
In matchless majesty;
The cricket chirped, the firefly
Pursued his fitful dance;
'Twas in the slumbrous, balmy night
That those two met—by chance.

They met. She was a tender thing
With lustrous, shining eye,
And down the garden path she moved
Warbling sweet melody.
He paused to listen. On she sped
With foot-falls soft and light,
They met upon that tennis lawn,
That peaceful summer night.

With throbbing pulse and beating heart,
He spoke in accents low,
Into her glancing eyes there came
A stronger, deeper glow.
Then up the apple tree she swarmed,
And there, vindictive spat,
For these two were my bull-pup and
My next-door neighbor's cat. [*Lampoon.*

BIBLE ERRORS.—Here is a bit of information which will do for that conventional scrap-book which is the property of every well-regulated household. Many editions of the Bible have been published during the last 300 years, and into not a few of them some peculiar errors have crept. What is known as the "Breeches Bible" (Geneva, 1560) was so called because Genesis iii., 7, was translated: "They sewed fig leaves together and made themselves breeches," instead of "aprons," as in the English version now used. In the "Treacle Bible" (1568) Jeremiah viii, 22, was made to read: "Is there no treacle in Gilead," etc., instead of "balm," and in 1609 the word was changed to "rosin;" "balm" was first used in 1611. The "Vinegar Bible," printed in Oxford in 1717, by John Basket, derives its name from the heading of Luke xx., which was made to read: "The parable of the vinegar." The book had many other errors, from which it has also been called, after the printer's name. "A basket of errors," in 1631 a Bible was printed in England, and in 1732 another appeared in Germany, both of which made the seventh commandment read: "Thou shalt steal," the word "not" being omitted. It has been very appropriately called the "Wicked Bible."

LORENZO DE MEDICI ON HIS DEATH BED.—The dying man said he had three sins to confess, for which he asked absolution—the sack of Volterra, the money taken from the Monte dell Fanciulle, and the blood shed in punishing those who were implicated in the Pazzi conspiracy. While speaking of these things he became greatly agitated, and Savonarola, to calm him, kept on repeating: "God is good, God is merciful. But," he went on, "you must do three things." "What are they, father?" asked Lorenzo, The countenance of Savonarola became grave as, extending the fingers of his right hand, he replied: "First, you must have a great and living faith in the mercy of God." "In that I have the greatest faith." "Secondly, you must restore all that you have wrongfully taken away, or instruct your sons to make restitution for you." For a moment this demand seemed greatly to distress Lorenzo; but, at last, making an effort he signified his assent by an inclination of his head. The third requirement was yet to be made. Savonarola became still more solemn in manner, and seemed to increase in stature, as with terrible earnestness, he continued; "Lastly, you must restore liberty to your native country, as it was in the early days of the Republic of Florence." It was touching the root of the man's family pride and ambition. Summoning his remaining strength he angrily turned his back upon the friar and refused to utter another word. Savonarola departed without pronouncing absolution, and Lorenzo died soon afterward, on the same day, April 8th, 1492.—[*Savonarola: His Life and Times—Clark.*

THE discussion of the doctrine of evolution has stimulated an interest in monkey poetry; the "classic" given below is one of the most popular of this school of poesy:

THE MONKEY'S WEDDING.

The monkey married the baboon's sister,
Smacked his lips and then he kissed her.
Kissed so hard he raised a blister.
She set up a yell.

The bridesmaid stuck on some court plaster,
It stuck so fast it couldn't stick any faster,
Wasn't that a sad disaster?
Pretty soon it got well.

What do you think the bride was dressed in?
White gauze veil and a green glass breastpin,
Red kid shoes; she looked quite interesting.
She was quite a belle.

The bridegroom wore a blue shirt collar;
A black silk stock that cost a dollar,
Large false whiskers, the fashion to follow.
He cut quite a swell.

What do you think they had for supper?
Black-eyed beans and bread and butter,
Ducks in the duck house all in a flutter;
Pickled oysters, too.

Chestnuts boiled and raw and roasted,
Apples stewed and onions toasted;
Music in the corner posted,
Waiting for the cue.

What do you think was the tune they danced to?
Old Dan Tucker and sometimes Jim Crow,
Tails in the way and some got pinched, too,
Because they were too long.

What do you think they had for a fiddle:
An old banjo with a hole in the middle;
A tambourine made out of a riddle,
And that's the end of my song. —*Tennyson.*

HOW A TOAD UNDRESSED.—A gentleman sends to an agricultural paper an amusing description of "How a Toad Takes Off His Coat and Pants." He says he has seen one do it, and a friend has seen another do the same thing in the same way:

"About the middle of July I found a toad on a hill of melons, and not wanting him to leave, I hoed around him. He appeared sluggish and not inclined to move. Presently I observed him pressing his elbows against his sides and rubbing downward. He appeared so singular that I watched to see what he was up to. After a few smart rubs his skin began to burst open along his back. 'Now,' said I, 'old fellow, you have done it;' but he appeared to be unconcerned, and kept on rubbing until he had worked all his skin into folds on his sides and hips; then grasping one hind leg with both his hands, he hauled off one leg of his pants the same as anybody would, then stripped the other hind leg in the same way. He then took his cast-off cuticle forward between his fore-legs into his mouth and swallowed it; then, by raising and lowering his head, swallowing as his head came down, he stripped off the skin underneath until it came to his fore-legs, and then grasping one of these with the opposite hand, by considerable pulling, stripped off the skin; changing hands, he stripped the other, and by a slight motion of the head, and all the while swallowing, he drew it from the neck and swallowed the whole. The operation seemed an agreeable one and occupied but a short time."

WON'T LET HIM OFF.

And so this traitor-lover strives
To turn her love to hate;
With the Order of the Mitten she
Him will not decorate.
For girls are many and beaus are few,
With him she will not quarrel;
She hath up in her bureau-drawer,
'Mid gauds of jet and coral,
And handkerchiefs, and ties of lace,
And snowy cuffs, and collars,
Letters which in a breach-of-promise suit
Would be worth ten thousand dollars.

FINLAND LOVE SONG.

I saw the moon rise clear
O'er hills and vales of snow,
Nor told my fleet reindeer
The track I wished to go.
Yet quick he bounded forth;
For well my reindeer knew
I've but one path on earth—
The path that leads to you.

The gloom that winter cast,
How soon the heart forgets,
When summer brings at last
Her sun that never sets!
So dawned my love to you;
So fixed through joy and pain,
Than summer sun more true,
'Twill never set again.

IN a late German story the hero gives a rhapsodical description of "the first kiss" in these ebullient words: "'Am I really dear to you, Sophia?' I whispered, and pressed my burning lips to her rosy mouth. "She did not say yes; she did not say no; but she returned my kiss, and my soul was no longer in my body; I touched the stars; the earth went from under my feet." All of which is very pretty and very poetic, but very indefinite. What the practical American reader wants to know is, if that is the transcendental German way of saying that he was at that particular moment lifted by a paternal boot-toe?—*Scientific American.*

For Women.

CONDUCTED BY MISS FAITH RIPLEY.

ORDER FOR THE BOYS.

M. A.

THE formation of orderly habits is usually defailed to the girls of a family. Boxes and bureaus are furnished them for the safe keeping of their toys and apparel; the careful arrangement of which is early and patiently taught them, for the mother sees disgrace in the future for her disorderly daughter. Disorder seems to be considered the boys' exclusive right, and not at all discreditable to them; hence, little pains is taken to teach them to be orderly. They may receive now and then a general lesson in the shape of a scolding at some rare display of disorder, but it is usually considered a matter of jest that the boys make mops of their caps and cushion the chairs with jackets and coats. It is only natural that every rainy day, the boys should bring out the old RURALS and Harpers and leave them strewn about the house for their mother or sisters to arrange and replace. Mother's bureau will do for the boys' clothing and so she assumes the whole care of it. I see no reason for this unjust distinction and, believe that mothers are doing themselves and their boys a great wrong in allowing it.

I readily admit that disorderly girls are a disgrace to themselves and their families, but hold that disorderly habits in boys are quite as reprehensible. Order is mostly a habit resulting from education, and boys are quite as tractable in acquiring the habit as are girls. Mothers would save themselves a vast amount of time and trouble if they would begin with their boys while they still have perfect control over them, and while habits are easily formed, and, providing a place for everything, *insist* that everything shall be put in its place.

As an example of what can be done in this way, I have in my mind a lady friend, a farmer's wife, the mother of five active, mischievous *boyish* boys.

It is a matter of wonder to many of her acquaintances that with so much work to do and so many wild boys to care for, she still manages to keep her home tidy. The writer happens to know that she is assisted in this by the habits of order which she has instilled into these same boys. A hook is provided for the hat and coat of each of the boys, and upon this these garments must always be hung. Her boys have as many playthings and papers as other boys and use them as freely, but it is a fixed law in this household that whoever uses these shall replace them. Paying a visit there not long since, I was surprised at the order and neatness which the boys displayed in caring for their own clothing and in making a change of suit, without any help or even a word from the mother; the suit doffed being carefully folded or hung away. On expressing to the mother my surprise at such an unusual proceeding, she said, "Oh! yes, they always do so. It took some time and patience to teach them, but it was time and patience put on interest."

If many mothers had the time which they spend "picking up" after their boys, it would give them leisure to read the family papers into which now, they have scarcely a chance to glance. How many husbands ever think of conveying a discarded garment farther than the bed or the first chair, while to brush and put away a garment for future use would be an undreamed of thing; it is only the boy grown into the man. Slatternly farm yards, tumble down buildings, pigs in the garden, these trials that are a continual vexation of spirit to many a woman, are only the results of disorderly habits. A wife cannot instil order into her husband, it is too late; the trite illustration of straightening the crooked tree would be appropriate, but I forbear its repetition. It is a work that must be done for the boys. Teach and require your boys to be orderly; help them to make Heaven's first law one of the ruling principles of their lives. They can not succeed without it, for it is one of the elements of prosperity. See to it that your boy as well as your girl, acquires orderly habits and thus lay one sure foundation stone for the happiness of a future family.

CORRESPONDENTS' CORNER.

DEAR FAITH RIPLEY:—You wished some inquiries as to what the readers of the RURAL would like. We country women need some nice-looking overdresses to ride, walk and fish in—something that looks well and is thick enough to protect us from the dust; a garment that sitting down on will not make it look as if rolled up for ironing. Would you recommend some sort of striped debeige or will coarse linen do? Fine linen of a pale color is a fright after it is worn a few times. Can't we have something better? We want also some picnic and excursion hats; we must make them ourselves and we would like your judgment as regards beauty. The very fine styles you city ladies enjoy, will not stand the sun, wind and rain, we country girls get. Summer is more trying than winter, for it is five hours hot, and cool night and morning. It is so breezy here (near Niagara river and falls) that there is almost always a brisk air, and we really need to be pretty well clothed all summer to enjoy anything.

Tell every lady who has to scrub and scour her floors, if she will wash all the cast-off winter garments and set herself and the children to work making nice sewed balls of carpet rags, that toward September 1st I will send our recipes for home-made colorings for carpets, and the family can all enjoy having a nice carpet that will wear five years and be dry and warm for the winter.

Youngstown, Niagara Co., N. Y. J. M. L.

Flannel or all-wool delaine in woolen goods and bunting, either French or good quality of domestic manufacture, are what I would suggest. These goods come in all colors and shades. Later in the season you might have a toilette or two of some of the pretty Scotch ginghams. If made of woolen goods, you can have one skirt, kilt-plaited, and a jacket and vest. The polonaise is not so popular this season; however, if you prefer that style, I would advise a plain one, as the much draped ones are apt to get out of order, and when one is on an excursion it is rather irksome to be "pinning up" fallen loopings. If you like, I will send you samples of woolen and washable materials for country wear. As to hats, now that straw ones are sold as low as 30, 40 and 50c., it seems almost a waste of time to make them. A wide brim, coarse black, brown or drab straw, trimmed with a scarf of veiling, same color as the suit or grenadine, or silk, and ornamented with a stiff wing or breast, makes a pretty, stylish, economical and serviceable hat. Streaming ribbons, flowers and ostrich feathers, are poor investments for every-day hats.

ROCK ME TO SLEEP, MOTHER.

Backward, turn backward! oh, time, in your flight;
Make me a child again, just for to-night!
Mother, come back from the echoless shore,
Take me again to your heart as of yore.
Kiss from my forehead the furrows of care,
Smooth the few silver threads out of my hair:
Over my slumbers your loving watch keep,
Rock me to sleep, Mother, rock me to sleep!

Backward, flow backward, O swift tide of years!
I am weary of toil, I am weary of tears:
Toil without recompense, tears all in vain,
Take them, and give me my childhood again!
I have grown weary of dust and decay,
Weary of flinging my soul-wealth away.
Weary of sowing for others to reap;
Rock me to sleep, Mother, rock me to sleep!

Tired of the hollow, the base, the untrue,
Mother, O, Mother, my heart calls for you!
Many a summer the grass has grown green,
Blossomed and faded, our faces between:
Yet with strong yearning and passionate pain,
Long I to-night for your presence again:
Come from the silence so long and so deep—
Rock me to sleep, Mother, rock me to sleep!

Over my heart in the days that have flown,
No love like mother-love ever has shone:
No other worship abides and endures,
Faithful, unselfish and patient like yours!
None like a mother can charm away pain
From the sick soul and the world weary brain.
Slumbers soft calm o'er my heavy lids creep,
Rock me to sleep, Mother, rock me to sleep!

Come, let your brown hair, just lighted with gold,
Fall on your shoulders again as of old;
Let it drop over my forehead to-night,
Shading my weak eyes away from the light!
For with its sunny-edged shadows once more,
Happy will throng the sweet visions of yore.
Lovingly, softly, its bright billows sweep,
Rock me to sleep, Mother, rock me to sleep.

Mother, dear mother! the years have been long
Since last I was hushed by your lullaby song.
Sing then again,—to my soul it shall seem
Womanhood's years have been only a dream.
Clasp to your arms in a loving embrace,
With your soft lashes just sweeping my face,
Never hereafter, to work or to weep;
Rock me to sleep, Mother, rock me to sleep!

[*E. E. W., Cooperstown, N. Y.*

FAITH RIPLEY—Dear Madam:—I send you an answer to an inquiry in the correspondents' corner, how to paint the kitchen floor. When I began housekeeping I had but one room, which had to answer for parlor and kitchen both, and in trying to make it look its best I became quite an expert in painting floors, and nothing ever gave me greater satisfaction when it was done. I hope I have made the directions plain enough. I was afraid of making my article too long.

Have you any patterns for zephyr work on railroad canvas, not too elaborate for a little girl of 10 to execute?

We have a youth's department at our county fair, held in September, and my children like to compete.

ANSWER TO INQUIRY, HOW TO PAINT FLOORS.

I have had considerable practice in painting floors, and have always been better satisfied with results when I have mixed the paint myself. Use boiled linseed oil; it needs a little japan put in to make it dry quicker. A druggist will know the proportion of drying to a gallon of oil. Stir French yellow into the oil until it is thick enough to spread easily with a brush. Paint spreads better when mixed over the night before using. I also put in some white lead—about the size of a hen's egg to a gallon of oil. It gives the paint a hard, glossy surface, and adds both to the looks and durability. Red lead can be used instead, but I prefer the shade given when white is used. Put on one coat, and the next day examine it, and if it is dry enough put on the second coat. When the paint becomes too thick, thin it with a little more oil. It is better if one can keep from living on a floor for a week after it is painted; but if it rubs off some, after it has been mopped a few times it will not be noticed. The first week or two the floor should be mopped with skim-milk, and water. It makes it smooth. It is not much trouble for a woman to do it all from beginning to end, and a good painted floor looks well and saves a great deal of hard labor. AUNT RACHEL.

[Can any of the RURAL ladies send Aunt Rachel patterns for zephyr work on railroad canvas? Address her, care of Faith Ripley, RURAL NEW-YORKER office.]

CAN any one give a recipe for imitating black walnut or rosewood, with full directions for use?

Richland, Ia. E. T.

F. B., Belle Plains, Iowa, asks for a recipe for coloring white kid gloves, black or slate-color.

L. S. B. wants the words of Peleg Arkwright's Love in Oyster Bay.

S. M. would like Betsy Bobbin's views on the question of suffrage for women.

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

LADIES AND HOUSEWORK.

It is a mistake to suppose that to be a lady implies ignorance of all that pertains to the kitchen or to the household in any of its departments. I once heard a mother say with a toss of the head, on hearing that her daughter would tease the laundry woman to let her iron the little things, like pocket handkerchiefs and napkins, "eh! I am afraid I shall never make a lady of her."

Florence Nightingale, with all her philantrophy, was well versed in the arts of culinary life by practice, or she would have been at a loss to know how to nurse the sick soldier herself or to guide others.

There is nothing in the act of domestic labor, in any of its departments, which can prevent the person so occupied from allowing her mind to be engaged in something elevating. Burns followed the plow and composed his Highland Mary; verses which have made him immortal. Bunyan, in Bedford jail, wrote the Pilgrim's Progress, and, while so occupied, made tagged boot-laces to support his wife and children. A girl may eat the bread of luxury and be clothed in velvet and satin and if she be without any aim or object in life, her mind may become a foul mass of hideous deformity, so that the atmosphere around her will be painful to all the pure-minded. It is not the outward act which degrades, but the thoughts of the heart. Solomon understood this well when he said, "Keep thy heart with all diligence; for out of it are the issues of life." Teach your children that an hour spent in physical labor in the home, may be as conducive to a good development of muscle and sinew, as an hour spent in a gymnasium. The dignity and great importance of labor should be intelligently imparted to the young, and that strength, and beauty will be developed by a proper exercise of the body.

Children educated to look on household, or any labor as honorable will be respectful to servants who will love them and be more likely to treat them with the kindness and deference which their higher social position entitles them to. If the servant sees that her mistress looks with disdain on her child for wishing to work in the kitchen, the effect would be to lower her own self-respect, and this would work an evil. What we need is to increase self-respect in servants without which their daily tasks will have a tendency to lower instead of elevating them. The servant should have a room with its book shelf, its work-basket, pictures on the walls and the many nameless things which go towards making a room home-like, and attractive, which are eloquent when alone, elevating the thoughts of the occupant unconsciously. I know a few women at the heads of families who appreciate the great importance of looking well to the comfort of their servants, and at the same time seek to supply the soul's needs, knowing that even if no higher motive than thankfulness for kindness, control her action, such a servant will not be as likely to be unfaithful to her responsibilities, as the servant who is made to feel that her comforts and needs have no part in her mistress's thoughts. There is nothing in servitude in itself degrading, for we are all, both rich and poor, dependent in some sense.

It will be far better for all, when the servant knows that coal-oil should not be used to kindle fires with, thus endangering the life of herself and others. Will it not be a relief when a mother can leave her infant with a nurse who cares or has the sense to know that the child should be fed before hunger makes it irritable? Will it not be a comforting thing for parents to feel sure that their children are in no danger from hearing superstitions stories about ghosts or, far worse—what every parent shudders to contemplate—the impure stories which the low, the vulgar, the ignorant revel in?

Let us therefore, seek by words and actions to raise, not to lower, the minds of the domestics in our homes. Don't fear that they are going to know too much; don't be afraid to let them see that you are dependent upon them for comforts and that you appreciate most highly their faithfulness. That pretty, neat, modest girl may be a mistress herself: let her learn as a servant that self-respect which will enable her to dignify any position in life.

FANCY FREE.

CHIPS FOR THE HOUSEKEEPER'S BASKET.

Use kerosene to clean unvarnished furniture.

Try benzine for removing paint spatters on window glass.

Blankets, and indeed flannels of any kind, should not be washed with soap which has resin in it.

If cheese gets too dry to eat, grate it, pour on brandy and pack into jars.

An excellent wax varnish for furniture is made by dissolving over a gentle heat, three ounces of wax in one quart of oil of turpentine.

Use waste paper for cleaning stoves, tinware, knives, spoons, windows, mirrors, lamp-chimneys, etc.

Dissolve four or five pounds of washing soda in boiling water and throw down the kitchen sink to prevent the pipes stopping up with grease, etc. Do this every few weeks.

Sweet oil is recommended for polishing pianos. Apply with a chamois skin and rub with different skins as they become saturated with the oil. It requires one or two hours of hard rubbing to restore an instrument to its original luster.

TO RELIEVE CORNS ON THE SOLE OF THE FOOT.

Cut a piece of stout card-board to fit the inside of the sole of the shoe. The card-board must be large enough in every way to prevent it shifting under the foot in walking. Cut a round hole in it exactly where the corn rests but a little larger than the corn. This arrangement relieves the corn from the pressure and allows of its cure and at the same time gives immediate relief in walking.

Remedies for Corns.

A bit of linen dipped in turpentine and wrapped around the corn night and morning, if persevered in, will give relief. Arnica applied likewise will alleviate the pain. Lemon juice is also beneficial, softening the hard skin so that with a blunt knife a considerable portion of the corn may be removed. The easiest way to apply it is to cut off a piece of lemon, then nick it so as to let in the toe with the corn and bind on at night. Repeat twice or thrice. A good corn plaster can be made by dissolving by heat two ounces of yellow wax in two ounces of purified ammonia and just before it is cold add six drachms of acetate of copper. Spread this ointment on a piece of soft leather. Before applying, soak the corn for some time in a solution of soda and pare as closely as possible. Corns are entirely owing to continued pressure on some one part. At first they are the production of the outer skin alone, but by gradual thickening they become connected not only with the true skin beneath, but even with the adjacent muscles, and, like many another evil, prevention is better than cure.

MRS. CLAYTON.

DOMESTIC RECIPES.

Baked Rhubarb.

If rhubarb be *baked* according to a recipe given in a RURAL of last year, it will be found much better than if *stewed*.

Wash and peel the rhubarb, and cut each stalk into square pieces. Place in a porcelain sauce-pan; cover the pie-plant with sugar, and add enough water to moisten the sugar. Cover the pan, and bake the rhubarb until it becomes tender and clear. The oven should be only moderately heated, as the pie-plant will lose its shape unless baked slowly. It should be very cold when served. It is best if prepared in the morning and kept in a cold place until wanted.

Strawberry Short-Cake.

Stir two teaspoonfuls of baking-powder into one pint of flour. Rub one-fourth of a teacup of butter into the flour. Mix soft with sweet milk. Roll into two thin cakes and bake on round pie-tins. As soon as taken from the oven, put one of the cakes on a large plate. Butter the cake, and cover it with strawberries; sprinkle thickly with sugar. Then put the other cake on the strawberries, and proceed as before. Set the short-cake into the oven for a few minutes, which will increase the juice of the berries.

Any good biscuit dough will answer for fruit short-cakes, only that it must be a little richer with shortening, than for plain biscuit.

Lyons, Iowa. MRS. M. G. R.

Pressed Corned Beef.

Soak over night, and the next morning put to boil in *cold* water. Boil gently four or five hours: let stand in the liquor in which it was boiled until somewhat cool, but not cold. Take out of the pot and with a knife and fork divide and shred it into bits, mixing the fat and lean together. Season with pepper and a little ground cloves. Pack into a small pan—arrange a heavy weight on top to press it down, and set it aside until the next day. It is excellent cut in thin slices for luncheon or tea.

E. M.

Essence of Herbs for Gravies, Soups, etc.

Take of winter savory, sweet marjoram, lemon thyme and sweet basil each one ounce; grated lemon peel and eschalots each one-half ounce; crushed celery seed one-fourth ounce, and proof spirit one pint. Shake frequently for two weeks, when the clear liquor may be poured off from the sediment. A very little will give a superior flavor to soups, gravies, etc.

MRS. ATKINSON.

Boiled Cod.

Sew the fish up in a thin cloth and cook in boiling water twenty minutes to the pound. Remove the cloth, and when ready to serve pour over a sauce made by adding to a cup of boiling water three even tablespoonfuls of butter mixed with one dessert spoonful of flour, the beaten yelk of an egg, the juice of one lemon and two dozen capers. Boil for an instant and turn over the fish.

MARY B.

Maple Sugar and Sirup.

We are indebted to Mr. W. I. Chamberlain of Hudson, Ohio for a sample of sugar and a jug containing two gallons of sirup manufactured according to his directions in RURAL of March 22. The light color of the sirup is noteworthy and we do not think the quality of either can be excelled.

News of the Week.

MISCELLANEOUS.

Monday, May 12, 1879.

The 'longshoremen's strike is virtually over here, most of the steamer lines having taken on their old hands at old rates. Out in Winnepeg 1,000 railroad operatives are on strike against a reduction of wages by the Canadian Pacific railroad. On April 23d the body of Harry Burrell, of Little Falls, N. Y., well known in connection with the manufacture of dairy implements, was stolen from the tomb in which it had just been deposited. It was soon recovered, however, and now the body-snatchers are penitent in "quod." By the way, although no definite announcement of the matter has been made, there is no doubt but that the "remains" of A. T. Stewart have been restored to his friends, and now rest in the grand new cathedral donated by Mrs. Stewart to Garden City, Long Island. Legislatures seem to have hit upon a new way of drawing extra pay, by refusing during the regular sessions, to pass appropriation bills, thus rendering an extra session necessary to carry on the government, State or national, and pocketing the comfortable mileage and big pay for little work during such extra sessions. The Texan legislature is the last to adopt this method of lining their pockets with the earnings of their constituents. The government seems determined to dam that tide of immigration into the Indian Territory and to roll back the first wavelets that have passed the frontier. Sheridan has been ordered to see to the matter, with full powers and instructions to tolerate no "humbug." Kansas folks, however, seem not to think much of the government's backbone and are still pushing the project ahead. At last the police are certain that they have captured one of the robbers of the Manhattan Bank of this city. It will be remembered that some months ago this institution was burglarized in day-light one Sunday morning, and cash and securities to the amount of nearly three million dollars were stolen. Congress has since issued fresh bonds instead of those stolen, on the bank guaranteeing that no loss should accrue the government, and the legislature of New York has replaced the stolen State securities on the same condition. The other day John Dobbs, alias Kerrigan, a notorious burglar, tried to pass $5,000 worth of the bonds in Philadelphia, and was arrested and handed over to the police authorities of this city.

The report of the Commissioners of Immigration at this port for the year ending March 31 shows an increase in the number of immigrants who landed here of 60 per cent over last year; or 88,000 instead of 54,000. The immigration of 1878 was the lowest in 30 years. Of all the immigrants to this country since 1847, 70 per cent have landed at this port, and since that date Germany has sent more settlers here than Ireland, although it is only within the last ten years that the annual influx of the former has exceeded that of the latter. From 1874 to 1878, 2,973, 769 Protestants have come among us against 2,699,080 Catholics, and the disproportion both in religion and nationality is yearly increasing. The Castle Garden authorities estimate that since the establishment of the depot, the immigrants have brought with them $389,000,000; to say nothing of the rapid development of the wealth of the country by their labor.

The exodus of the colored people from the South still continues. Lately a convention of whites with a few colored men among them met at Vicksburg to discuss the causes of the movement and try to put an end to it. The resolutions they reported attribute the emmigration to: "The low price of cotton and partial failure of the crop of the past year; the rotational system of planting adopted to some sections whereby labor was deprived of intelligence to direct it and the absence of economy to make it profitable; the vicious system of credit fostered by the laws permitting laborers and tenants to mortgage their crops before they were grown, or even planted; apprehension on the part of many colored people produced by insidious reports that their civil and political rights are in danger; the false rumors diligently disseminated that by emigrating to Kansas the colored people would obtain land, mules and money from the goverment without cost to themselves, and become independent farmers; many retail country storekeepers engaged in the business of selling whisky to laborers and tenants, whereby their morals have been corrupted, their labor rendered insufficient, and the pleasant relations between them and their landlords and employers destroyed." They agree that many mistakes have hitherto been made both by "whites" and "blacks" and counsel burying the past and starting afresh on a more friendly line. This burial of the past, however, all experience, even that of the late Confederacy, shows to be a most difficult kind of entombment.

FOREIGN.

Journalism has nothing more unique than the Semla Svabodr, "Land and Liberty," the organ of the Russian Nihilists. Their conspiracy differs from any other in history in publishing a newspaper twice a month, with its subscription price $4.50 a year, under its caption. This sheet has been in circulation for a year, and goes everywhere. High officers of the state find them folded in their official papers, soldiers come across them in their knapsacks, they are picked up in the imperial palaces, copies are suddenly discovered in the police stations, literally no place in St. Petersburg is free from them, but editor, publication office and carriers remain a puzzling secret to the police. The place where two printing presses were concealed was betrayed by one of the carriers, and the next number of the paper announced the carrier's sentence and his execution. He had been stabbed in his hotel. An editorial in the same issue spoke of the "inconvenience" to the editor of having lost his "editorial portfolio" by this betrayal, but the loss, the article went on to say, was avenged. From such incidents as these alone a fair conception can be formed of the disturbed state of society in the Empire of the czar.

HERMAN.

VARIOUS.

The Prussian Ministry of Agriculture has just issued the annual return of the ravages of diseases of all kinds among the flocks and herds of Prussia during the past year. Foot-and-mouth disease caused the death of 18,589 cattle, 2435 sheep, and 2047 pigs, or in all 23,701 animals, many of which were slaughtered. There were 1980 cattle attacked by pleuro-pneumonia, which died or were slaughtered. Inflammation of the spleen caused the death of 70 horses, 1903 cattle 1327 sheep and 202 pigs. There were as many as 2848 horses, which died or were killed on account of glanders or farcy. The pock carried off 3888 sheep, and 85 cattle and horses, while 1309 sheep died of scab. Finally, besides 132 cattle, 33 sheep, 16 pigs and 6 horses found suffering from rabies, there were killed 1098 dogs, attacked by rabies or hydrophobia.

Dr. Russell, who, at the opening of the war of the rebellion, visited this country as correspondent of the London Times, and is popularly known here as "Bull Run Russell," is to be knighted and to receive a valuable appointment. This has been effected through the influence of the Prince of Wales and Duke of Sutherland, who are attached friends of Dr. Russell.

It removes wrinkles and softens the skin. The regular use of MURRAY & LANMAN'S FLORIDA WATER at the toilet tends to prevent and remove wrinkles, the softness of the skin produced by it taking away the natural inclination of the cuticle to form into ridges and furrows.

Oh, why will you let that invalid friend suffer that Hop Bitters will so certainly cure.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, May 10th, 1879.

BEANS AND PEAS.—There has been some activity in marrow beans at 2½c. decline. Some holders still asking 40c. Prime mediums are scarce and firm, trade mainly at 25@30c. Pea and w. kidney dull, the latter preferred for sale at inside figures. Red kidney tending higher, late prices named for lots to arrive. Black easy. Green peas strong at $1.50. S. B. E. peas quiet at $2.50 per 2 bush. bag. Canada field, in bulk and bond, 75c. Beans, marrow, prime, $1.37½; fair to good, $1.25@1.35; medium, prime, $1.30@1.32½; fair to good, $1.20@1.25; pea, $1.20@1.35; white kidney, $1.30@1.50; red kidney, prime, $2.85@3; black, $2.10@2.15.

Exports for week, 1,125 pkgs.; receipts do., 4,424 bush.

BEESWAX.—There is a light trade in progress, with Western and Southern quoted at 24@25c.

Exports for week, 1,600 lbs.

BUTTER.—Arrivals of State moderate. Very little of late receipts left over, but there is some accumulation of poor State white that is difficult to place. There is some trade in lines where quality favors wholesale buying, but such lots are not plenty. As we are so close to pasture, flavored and tinted stock, dealers do not look for a sharp, large demand for present style of quality. Exporters are looking at some marks, but at the moment sellers will not shade rates down to their views, as the grade wanted can be better sold for local or Eastern use. Western dairy made is not showing its usual superiority to State. Western creamery leads the best trade; some selections for fancy grocers' use, 20c. Artificial coloring is generally condemned; few succeed in the art, and there is not much time for profitable experiments.

NEW BUTTER.—State pails and half tubs, choice, 15c.; good to prime, 13@14½c.; fair to good, 11@13c.; Welsh tubs, choice, 15c.; good to prime, 13@14½c.; fair to good, 11@13c.; State, tubs, poor to fair, 8@11c.; State creamery, best, 18c.; good to prime, 16@17c.; fair to good, 14@16c.; Western do., best, 13@19c.; good to prime, 16@17c.; fair to good, 14@16c.; imitation creamery, 13@15c.; Western, dairy, best, 13@14c.; good to prime, 11@13c.; fair to good, 10@11c.; poor to fair, 6@10c.; factory, best, 12@12½c.; good to prime, 8@10c.; fair to good, 7@8c. Old ranges, State, 7@12c.; Western, 5@8c.; grease, 3@4c.

Exports for week, 5,127 firkins. Receipts, 21,000 pkgs.

CHEESE.—The receipts have been somewhat freer, but the exporters have stood ready to take all of the choice grades and have met steady prices. The old stock is pretty well cleared out, and the advices from the other side are encouraging. Shippers on the new make.

Prices for new are 6½@7c. for best; 6@6½c. for good; 4@5½c. for half skimmed, and 2@3½c. for skimmed; and for old as follows: 7½@8c. for fine lots; 6@7c. for good; 5@6c. for fair; 2@3c. for skimmed; 3@5. for half skimmed; Western factory, fine, 7@7½c.; good and prime, 5@6½c.; do. full skimmed, 2@3c.; do half skimmed at 3@4½c.

Receipts for week, 14,561 boxes.

Liverpool cable, 42s.

Steam, 30s.

COTTON.—The tendency has been upward again the past week, with speculation brisk, and the foreign markets following the improvement. Latest prices are for May, 12.40@12.42c.; June, 12.51@12.52c.; July, 12.69c.; August, 12.35c.; September, 12.52@12.53c.; October, 11.76@11.77c.; November, 11.37@11.38c.; December, 11.26@11.27c.; January, 11 29@11.30c.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted:

Strict good ordinary	11 9-16	Middling	12⅛

DRIED FRUITS.—Trade has been very light the past week in all articles; shippers neglect apples and home demands are slack.

Prices generally are steady. Apples—evaporated Alden's & William's 10@10½c.; do, new process at 8@8½c. State pi'ms, 13½c.; Blackberries quoted at 4½c. Peaches—Peeled Georgia, 7@7½c. for poor; 8½@9c. for fair to good; 10c. for prime; choice North Carolina, 12@13c.; good do., 9@10c.; unpeeled halves, 3@3½c. quarters, 2½@3c. Pitted cherries, 20c. Apples—New, 2½@2½c. for southern quarters in bags; 3½@4c. for prime sliced; do., fair and good, 3@3½c.; State at 3@4c. for new sliced; and 3@4c. for quarters; Western at 3@4c. for new quarters. Raspberries, 30c.

Exports for week, 326 bbls. dried apples.

EGGS.—Receipts for week, 14,750 bbls.; do. last week, 16,500 do. The market has ruled weak. Loss off may soon be demanded; Western already show two grades: strictly fresh are held. Canadian are in market but not offered at the prevailing rates. Duck eggs quoted same as hen. Near points, dozen, 12@12½c.; State and Penn., 11½@11¾c.; Western best 11¾c.; other, 10@10½c.; Southern, 10½@11c.; goose, 18@20c.

MAPLE SUGAR.—Quiet at low prices: 7@9c. fair to best cakes; 75c. for strup in tin.

HONEY.—Peddling at 7@10c. for comb; 6@8c. strained.

FRESH FRUITS.—Bananas cut off a good deal of the spring demand for apples. Baldwins to make $2 75 must be faultless. Russets and fair Baldwins, $2@2 25; inferior lots, $1@1 50. Exports $1,030 bbls. for week. Cranberries nominal at last rates. Strawberries have been in light supply and high prices have ruled. N. C., 40@50c. quart; Norfolk, 25@50c.; Chas. good to prime, 35@45c.; other 15@25. The late advance in peanuts seems established; there is, however, no further speculative movement. Va. hand-picked, $1 35@1 40; other, $1 10@1 25; shelled, 5¼@5½c. Pecans, 6@8c. Hot-house Black Hamburg grapes, $1 50@2 lb. Strawberries, 75c.@1 50 quart.

FLOUR.—There has been a good full business the past week, and prices advancing, the stimulus being the rising tendency of wheat.

Latest prices are $3.45@3.90 for inferior to very choice superfine State; $3.85@4 00 for poor to good extra do., odd lots and lines; $4.00@4.35 for good to very choice do.; $3.45@3.90 for inferior to very choice superfine Indiana, Iowa, Michigan, &c.; $3.65@4.00 for very inferior to good shipping extra do., and $4.00@4.35 for good to very choice extra do.; common to about choice white wheat extras, $4.35@5.45; choice to fancy do. at $5.50@6.65; red and amber winter wheat, inferior to very choice trade and family, at $4.25@6.25; round hoop Ohio at $4.60@4.40, and trade and family brands of do, at $4.50@6.25, the latter rate for very choice; St. Louis, $4.35@5.35 for very inferior to good extra; $5.35@6.25, for good to very choice (with a few very fancy brands up to $6.75); Minnesota clear, very inferior to fancy, at $4.85@4.85; Minnesota "straight," very inferior to strictly choice at $4.25@5.75; and very fancy as high as $6; and patent poor to strictly fancy at $5.35@8.87; few brands going above $7.50@7.65; unsound stock at from $2.25@5.25; city mill extra at $5.00@5.25 for West Indies (the latterrate for very fancy in new packages); do. for England and $3.70@4.00; do. trade family extras, $5.25@6.25; do. for South America, $5.35@5.85 for fair to very choice; No. 2 at $3.50@3.45 for poor to strictly fancy.

GRAIN.—Wheat has shown a sharp advance through speculative manipulations chiefly, and has been very active. Latest sales are of No. 1 white at $1.16@1.16½; white State at $1.17; No. 2 white at $1.13½@1.14; ungraded white at $1.12@1.15; white Canada in bond at $1.49; No. 1 red at $1.18 in store; No. 2 red at $1.17½@1.18; No. 2 red at $1.14; ungraded red at $1.05@1.15; No. 3 amber at $1.15@1.17; ungraded amber at $1.12½@1.17; mixed winter at $1.16½; No. 2 Spring at $1.04@1.05; No. 3 spring at 95@96c; rejected spring at 81@84c.; ungraded spring at 91c.@$1.03½; No. 1 white, May, at $1.15½@1.15; do., June, at $1.15½@1.16¼; No. 2 red, May, at $1.17¼@1.17½; do., June, at $1.17¼@1.18; do., July, at $1.15¼@1.15½; No. 2 amber, June, at $1.17½; New York No. 2 spring, June, at $1.03@1.01. Rye at 58@60c. for Western and 61@63½c. for state. Corn is higher also and active. Sales of New York No. 2 at 46¼@46¾c.; New York steamer mixed at 45¾@45¼c.; No. 3 at 44@45¾c.; ungraded western mixed at 44¾@47c.; New York No. 2 white at 45¾@5c.; New York steamer white at 49c.; white Western at 46¾@47c.; New York No. 2, May option, at 46¾c.; do., June option, at 45¼c.; do., July option, at 45¾c.; steamer mixed, May option, at 44¾c.; do., June option, at 43¾@43¾c. Oats are higher and in good demand. Latest sales of New York No. 1 at 35¾c.; New York No. 1 white at 40c.; New York No. 2 at 35¼c.; New York No. 2 white at 37@37¾c. New York No. 3 at 31c.; New York No. 3 white at 35c.; No. 2 Chicago afloat at 35¾c., and do in store at 32½@31c.; mixed Western at 34¾@35¾c.; white do. at 36@39c.; mixed State at 35@35¾c.; white State at 38@40c.

HAY AND STRAW.—Receipts are small and demands full, with prices well sustained.

Sales at 40@45c. for shipping, and 70@85c. for retail qualities. Straw at 40@45c. for long rye; 35c. for short rye, and oats at 30@35c.

Exports for week, 198 bales.

OIL-CAKE.—Western is higher, quoted at $27.75@28 per ton.

HOPS.—Exports for the week 122 bales. Emmet Wells in his circular says: "A fair trade has been doing this week, chiefly with brewers, at unchanged prices. Exporters would take more hops could they find the quality to suit. It is said that western brewers have made quite an inroad upon stocks of choice hops in the interior, and better prices have ruled there than here during the last few weeks. Formerly these brewers got their supplies from Wisconsin and other Western States, but as there are no good hops remaining in those districts they have to send their orders East."

Quotations are New York's, new crop, choice, 8@12; New York's, new crop, medium, 7@8; New York's, new crop, low to fair, 5@6; Eastern, 6@9; Western, 6@9; Yearlings, 2@4; Olds, all growths, 1@2; Pacific coast, nominal, 8@12.

POULTRY AND GAME.—Live fowls and chicks have a good, steady sale. Supplies are likely to be liberal, and sellers do not press for high figures. Turkeys lower, being chiefly old Toms. Ducks steady. Few prime geese coming.

Spring chicks, 75c.@$1.25 ₱ pair; winter, 65@87c.; N. J. fowls, per lb., 11@11½c.; Western, 10½@11c.; Southern, 10@10½c.; roosters, old, 5@6c. Turkeys, Western, 11@13c. Ducks J'y, N. Y. & Pa., ₱ pair, 65@80c.; Western and Southern, 50@70c. Geese, N. J., ₱ pair, $1.50@1.75; N. Y. & Pa., $1.25@1.50; S. & W., 75c.@$1.13. Pigeons, 45@90c.

Country-dressed poultry is in light supply and prices are something higher. Light supplies of game give fancy poultry and extra call.

Turkeys, Jersey, prime small, 16@18c.; State and Western, do., 15@17c.; fair to good, large, 13@14c; Phila., dry-picked, 7@18c. Spring chickens, do., 45@50c.; winter, broilers, 30@35c. Fowls, Jersey, choice, ₱ lb., 13@14c.; State and Western, prime, 11@12c.; fair to good, 10@11c.; Phila., dry-picked, 13@15c. Capons, large and choice, 27@28c.; small, 23@25c. Slips, ₱ lb., 23@23c. Ducks, Jersey, 18@19c; State and Western, 17@18c.

Snipe and pigeons comprise the supply of game; quoted:

English snipe, $2.25@2.50 ₱ doz.; Dowitch, $1.50; plover, 1.75@$2; small and sand, 50c. Wild pigeons, trapped, $1.75; do. shot, $1.50. Squabs, $3.25.

PROVISIONS—Have been active and closed strong. Mess pork quoted for May at $9 95 bid and $10 00 asked; June at $9 95 bid; July at $10 05 bid and $10 10 asked, and August at $10.10 bid and $10 20 asked. Bacon at $4.90 for long clear and 5¾ for short clear. Lard—Western steam, at $6 30 for spot lots; $6 27½ for May; $6 27½ for June; $6.32½ for July, and $6 35@6 37½ for August. Stearine at 6¾c. for choice. Tallow at 6¼@6½c. for prime. Beef hams at $18@18.25. Beef—Extra India mess, $20@32, as to quality; packet, $11@11.50; plain mess, $9.75@10.50; extra mess at $10.50@11.50.

SEED.—Grass is quiet at 6@6¾c. for Western clover, and $1.30 for timothy.

TOBACCO.—The markets abroad appear to be fairly well stocked, and demand at present from shippers is very slack. Home trade demands are also tame. Prices are without change,

VEGETABLES.—Old potatoes are going out lower; Southern will soon be a feature. Many of present receipt of the latter are badly sorted and prices are thus rendered irregular. Bermuda, choice, per bbl., $6.00@6.50; Savannah, new, $5.00@5.50; Florida, new, choice, $5.00@6.00; culls, $2.00@2.50; early ross, Eastern, per 4-h bbl., $3.25@3.50; State, $2.87@3.12; Western, $2.50@3.00; do, bulk, per 180 lbs., $2.50@2 75; Peachblow, do., per bbl., $3.00@3.25; State, $3.00@3.25; Prolific, choice, $2 75@3 25; peerless, State, $2.62@2 75; in bulk, per 180 lbs., $2.50@2.62; Jackson white, $3.75@3.00; sweet potatoes, Del., $1.50. Near by gardens begin to blend products with the South, but all prime stuff sells fairly. Tomatoes from Florida are here. Asparagus keeps even prices, although New Jersey and Oyster Bay are contributing. Old crops not of much account. Cucumbers, Fla., per crate, $1.50@2.50; string beans, round, $1.0@1.50; flat, 75c.@$1.25; green peas, Norfolk, per ½ bbl. box, $2.50; N. C., per ½ bbl. crate, $2.00@2 25; per bush. crate, $1.00@1.37; Chas. and Sav., 50@75c.; asparagus, Oyster Bay, per doz., $3.00; Jersey, per doz., $1.50@2.50; Norfolk, Maryland and Delaware, $1.50@2.25; tomatoes, Bermuda, per box, 60c.@$1.00; radishes, Norfolk, ₱ 100 bunches, 75c.@$1 00; cabbage, Southern, ₱ bbl., $2.00@3.00; turnips, Southern, 100 bunches, $4.00@5.00 rhubarb, ₱ 100 bunches, $1.@2.00; onions, Bermuda, ₱ crate, $1.50@1.60; Dom., old, ₱ bbl., $2.@2.50; squash, Fla., per crate, $1.00@1.25; turnips, Russia, ₱ bbl., $1.50@1.75; beets, Bermuda, new, per crate, $1.75; carrots, ₱ bbl., $1.50@1 75.

WOOL.—The dealings here are still small and prices easy. The new clips in California, Texas and remote Western points are showing very strong prices; X and XX Ohio, old fleeces, are selling here at 31@33; No. 1. do, at 36; X and XX State, at 29c. Texas at 14@19c.; spring, California, at 13@20c.

LIVE STOCK MARKETS.

NEW YORK, Saturday, May 10th.

BEEVES.—Receipts for the week, 9,736 head; do., last week, 10,012 do. The market closed early after a sharp demand with Wednesday's prices, more than supported. Quality was in sellers' favor in the latest droves. Leaving out some bruised steers and a pair or two of coarse stags sold at 9c. ₱ lb., and about two car-loads of prime bullocks at 10¾c., to dress 56@57 lbs., the extreme range was 9¾@10¾c., to dress 56 lbs., and general sales were at 9¾@10c. ₱ lb., including sales of 15 car-loads of stillers at nearly to 9¾c. ₱ lb. average.

MILCH COWS are featureless as a market. A valuable cow would depend upon a chance sale here. Ordinary stock has merely a quoted range of $30@$50.

VEAL CALVES.—With an abundant offering prices are weak. Best Bucks Co. and N. J., live, 5½c.; do., State, 5c.; others, 3@4¾c. Hog-dressed calves, choice, 6¾@7½c.; poor to fair, 4½@5¾c.

SHEEP AND LAMBS.—Receipts for the week, 20,748 head; do. last week, 22,920 do. Some lots were left over and the market wound up easier. Clipped sheep brought 4¾@5¾c.; unshorn, 5¾@6¾c.; a few yearlings, 7¾@7¾c.; N. J. lambs, choice, 10@10½c. ₱ lb.; poor to prime, 7@9¾c.; Virginia, 7¾@9c.

HOGS.—Receipts for week, 34,305 head; do. last week, 27,925 do. Fairly firm, without many public sales, at 3¾@4c. for good corn-fed.

Dressed pork, State, light, 6@6¾c.; medium, 5¾@6c.; heavy, 4¾@5c.; city, 4¾@5¾c.

TRAINING FOR FARMERS.

M. OAKEY.

"WELL, my boy, what kind of a farmer are you going to be," I once asked of an intelligent looking lad who lived on a farm. "I don't know, sir," he replied. Since then, many similar cases have forced me to the conclusion, that the majority of boys brought up upon the farm are allowed by their fathers and permit themselves to grow up to manhood without forming any definite plan, or making any special preparation, for the future. Such boys drift along, and up into farmers, the same as they do into manhood, possessing only the requisite number of years, and it is morally certain that the manhood and farmer—"hood" without practical training will be only of the average grade.

Boys, this ought not to be so. You are expecting to engage, by-and-by, in the business of farming. Then why not make special effort to be fully prepared to take up that calling creditably and successfully. You should not be content with being only an average farmer, when you have abundant opportunity to make yourselves the head men in your occupation. You have every advantage and "chance" in your favor, and your course of training will be just as pleasant as it can be profitable. Determine that you will be the best farmer in your neighborhood, and master of your profession in all its details and then set about preparing yourself for and learning your business perfectly with perseverance, and you will meet with all the success you may desire.

Perhaps you are not ready to decide what particular branch of farming you will follow, but that is of no present importance and may safely be left to the future. You can, however early decide as to the kind of a farmer you will make—that no one shall be superior to you and that you will use every possible means to make such a decision the better. As steps in that preparation I offer you in brief the following general suggestions knowing they will call to mind other special means which will vary according to the circumstances and situation of each reader.

First, think. Do a great deal of it. Be constant with thought. Do not perform the slightest act of farming routine without some useful thoughts accompanying it. Do not be careless or ill-natured in thought about it, for that will spoil all, but study the operation in each detail however simple. Ascertain its "why" and its best "how," and try to improve on the method. Learn the principle of the machinery you handle and study how it applies to the use you make of it. Learn if some other machine does not apply the principle better, or learn why yours is best. Think it all out.

Second, study. Study the soil, its nature, adaptability and fertilization, etc. Study the crops and their culture, the stock and their treatment. Compare your father's method with others. Learn in what they differ and why the difference. Suggest properly and politely what you think would be improvements, and give your reasons for your belief. Always remember here, however, that those older than yourself have experience to guide them and maturer minds to judge of the merits or the systems they follow, so if you make suggestions be sure to be respectful to your elders. Then study books and do not think this a terrible bore. In them you will find the digested wisdom and experience of ages, and almost always in an attractive form. Study all those which treat on subjects relating to your occupation so far as you are able to purchase or borrow them, and you would do well to copy all items which impress you strongly, favorably or otherwise. Then study some agricultural paper. I don't advise you to read it but to study it. From it you will receive intelligence from all parts of the country, and the experience of others, which will give you a great deal to study. I would advise you also, to cut out and paste in a scrap book, under proper heads, all items you find in such papers that seem reliable and useful, or to which you may wish to refer.

Third, work, not for your father alone—of course he will expect that—but work for yourself. Get your father to give you a piece of land, a quarter, half, or even a whole acre, but begin small and increase afterwards. Now learn farming practically. Make that land yield you a profit. Be ambitious enough to pay rent to your father for it after you get started, in order to put yourself to the highest test. If you can start with sod land, do so, and put it the first year all in corn, charging yourself with all the manure you think best to use. Give it the best of care, and study and work that crop till it surpasses any acre your father has. Next year follow it with the usual rotation—perhaps one-half in roots and the other in oats; next with oats and barley, and next barley and wheat and clover, returning again to corn. By this means you will be practicing farming in a way that will be of great benefit to you. Take the whole responsibility of the crop upon yourself, and don't expect father to tell you when it needs cultivation. Learn that yourself, asking, perhaps, his advice. This acre will enable you to take a paper or two and purchase what books you desire for your further improvement. Do not be afraid to use part of your land for experimenting and carrying out your own ideas, or those you gather, never mind how odd they may seem to others. Tell your father that farmers are very negligent in omitting thus to train their boys. There is no doubt, however, that he will be one of the thoughtful ones to give his son every advantage possible.

Fourth, keep an account of your operations—your expenses—everything that costs you money: rent for the land, and your time, too, valued at the current wages of your neighborhood, and balance it with the sum derived from the sale of produce. From this simple example you will have learnt the whole practice of farm accounts.

Fifth. Sell your own products yourself. Here is a matter that is often entirely overlooked by farmers, and I would lay special emphasis upon it. Learn to be a salesman. "What kind of a salesman are you going to be?" is almost as important a question as the introductory one. Farming is a business that is two fold in its nature, like all other businesses. The merchant must learn to buy and then to sell. The same is true of the farmer. He must invest and then sell. The merchant will at least partially learn this, but it is of equal importance to the farmer, and should not be neglected. Now, selling father's products is not sufficient, though better than nothing done. You must feel a personal interest in the transaction, and by constant practice make yourself a first-class salesman, so that when you come to depend for a living upon your own farming you will understand how to handle the market most profitably.

If you have a desire for stock farming, then let your operations and your study and work be with them and of them, applying the same suggestions.

In a great measure your future is in your own hands. "What kind of a farmer are you going to be?"

MORE ABOUT THE GLADIOLUS.

DEAR UNCLE MARK:—You say the Gladiolus is a *tender* plant. We have had the bulbs remain in the ground during winter when the thermometer sank to 10 degrees below zero and yet grow the next season as well as ever. I know, however, that only *some* varieties will thus stand the winter. You say also that "each bulb sends up a stem *two feet* high." Now, except several dwarf varieties like Anies, the stems (flowering stalks) will average at least three feet high—at least *ours* will. You say also that each stem bears "a spike of from six to twelve flowers." Ours will average twenty.

Can it be that Uncle Mark is wrong, or are *our* Gladioli different from those of other people? In either case I hope you will publish my note. If *I* am wrong, I want to know it; if you are wrong, you must own up. I am proud to be one of the good RURAL'S Horticultural Club, and thank you sincerely for the bulb (or *corm*, as you call it) which I received in good order through the mail. Long may the club live, and long may you live to conduct the department and dispense among us the seeds and plants from the "RURAL Grounds." My mother says it is a generous undertaking, but only in accordance with the entire management of the RURAL NEW-YORKER. Yours, in the bonds of the Y. H. C. of the R. N. Y., JOE STEELE.

I thank Joseph for his criticisms. He is not entirely wrong in his statements, though they must be taken with some latitude. He would certainly convey a wrong idea of the Gladiolus to those who are not acquainted with it, if he in a brief general description of this flower should say that the flower stalks average at least three feet in hight, and that each spike will bear twenty flowers. I am loth to exaggerate things, so, although I have often seen Gladioli three feet high with a spike of twenty flowers or even more on strong specimens, I should mislead my young friends if I stated this as being always the case. I surmise that Master Joseph is a good gardener, who selects the best corms, grows them in a rich, light soil, and gives them the best culture, so to this extent his may be "different from those of other people."

Gladiolus Gandavensis, the one commonly cultivated in the gardens, is a hybrid of several species from the Cape of Good Hope, chiefly of the species Psittacinus. At the Cape the mean temperature throughout the year is 67 degrees, that of the coldest month being 57 degrees and of the hottest 79 degrees, so that hardy Gladioli do not spring from the Cape species; I have therefore reason to believe that the corms our friend found to be so hardy have descended chiefly from the hardy European species. UNCLE MARK.

A FEW SHRUBS AND WHAT TO DO WITH THEM.

(1.) THE TARTARIAN HONEYSUCKLE.—Of all shrubs this is the finest for a screen or an ornamental hedge. It needs no pruning whatever. It has a wonderful profusion of flowers, which can be cut to any extent without damage. If a single plant dies down from any cause, it will send up vigorous shoots from the roots and fill the breach within six months. It is not ferocious like bush thorn or hawthorn. It has no enemies whatever that destroy it, and few that ever take from it a leaf. It is a cleanly, bright-looking shrub, apart from the blossoms. Set the plants about two or three feet apart, and the growth will surprise you. In two years you will have a fine screen. Mulch with weeds or sawdust or chip manure. There are at least three varieties—white, red and pink. The white is dull in blossom and poor in growth. The red is handsome in bloom and fair in growth. The pink is incomparably the finest of all, for all purposes. You cannot plant it too freely.

(2.) A GROUP OF SHRUBS FOR BRIGHTNESS IN EARLY SPRING AND LATE AUTUMN.—A group of this kind adds greatly to the pleasure of a country home. Plant about ten feet apart, the Forsythia viridissima; the Red-Barked Dogwood; the American Euonymus; the Purple Filbert; the Mahonia; and the Golden Yew and Golden Arbor-Vitæ. An additional charm will accrue from a few low-trimmed Hemlocks scattered among the rest. The Forsythia is covered with bright, yellow blossoms, very early in spring, while its leaves in late autumn give us the rich purple, found nowhere else except in the Ash. The Dogwood is superb in crimson scarlet, both in April and November. The Euonymus extends the glory of autumn through November. The Mahonia is a glossy, rich evergreen, with bright red and yellow shades to the new wood. The Berberry and Filbert open the season early in May or the last of April, with a very pleasing purple. E. P. POWELL.

SHE APPROVES OF THE HORTICULTURAL CLUB.

DEAR UNCLE MARK:—I heartily approve of the Youth's Horticultural Club, and sincerely believe it will prove a grand success. I inclose a letter from each of my two little girls, hoping you will pardon poor writing as their school privileges have not been as good as I could wish for. I have generally the best vegetable garden in the neighborhood, and am also a great lover of flowers. I am thinking of having a small greenhouse erected this fall for the accommodation of my tender plants, also to start early cabbages and tomatoes. With best wishes, I am MRS. L. A. ABBOTT.

Clermont Co., O.

LETTERS FROM BOYS AND GIRLS.

UNCLE MARK:—Although I did not write for the prizes I should like to join your Horticultural Club, and send you a few garden notes. About two years ago I had a great fancy for making a little pocket-money by gardening, and papa prepared a piece of ground by plowing, rolling and harrowing, until it was quite fine. I chose thyme, lavender and sage, as they would keep all winter if not sold. The sowing of seed is the most particular work, because the fate of your crop depends on it. If too deep they are likely to rot, if not deep enough, to dry off; and it is not always one can strike a "happy medium." The thyme and sage grew quickly, but the lavender was delicate all the season, and only rewarded me with some very pleasant perfumed leaves. My thyme, after frequent back-aching warfare, was ready to cut in early September. It was tied in small bunches, hung head downward in the dark graucry to dry, and sold to the amount of $4.75, which was a very good return from one ounce of seed, besides supplying our own house, and some to give away. But it was the sage that caused me sorrow, and yet it grew and was harvested the same as the thyme. About a dollar's worth had been sold, when one day, being anxious to get some particular thing, I asked mamma to buy it from me. She gave me all I asked, $1.50, and no more attention was given to it until a young man, who had found a small desert of Sahara on the top of his head, came to ask if we would sell him some sage as a specific for that trouble. With her usual generosity, mamma gave him all he could carry home, and imagine my grief when the next day he brought her a bag full of butternuts, and it, too, in a poor nut year, when we had none in our own woods. Every time these butternuts went round and I received my share, instead of being able to distribute them as my own, I thought of the many people there are in the world who would like "to eat their cake and have it too." And to this day, whenever I see that youth whose hair is returning with sage results, I reflect and moralize. MARY JACK.

DEAR UNCLE TRUE: This is the second letter I have written to the RURAL. It seems as though the RURAL cousins were asleep. Come cousins, you must wake up or we shall not have any fun. The RURAL editors were so kind as to give us three columns, and I think we ought to occupy a part of this space at any rate. Relic Seeker must think he is going to over-awe us with his big talk, but he will find himself very much mistaken. There is Slayer of Conceit; poor fellow, I suppose he has gone to sleep and forgotten all about the RURAL and its cousins; he started in as though he was going to scare us. I sincerely hope that Relic Seeker and Jumping Jack will not do as that conceit slayer did.

It has occurred to me that we might possibly induce him to return to our circle if we renewed his subscription. I therefore move that we pass around a hat for this charitable purpose. Be liberal cousins; he was a good fellow. Until we hear from him, I sign myself

SLAYER OF CONCEIT'S SUCCESSOR.

DEAR UNCLE MARK:—I have received the prize which you sent me, and was very well pleased with it, and thank you for it. Mamma and I planted a little of each paper of the flower seeds. We have a piece of ground that papa prepared in front of the house nearly all filled up with flower shrubs, strawberries and grapes, and also a few evergreens. I am going to try and do my best with the seeds you sent me, and will let you know in the fall how I succeed. We have set out on our prairie home this spring about 3000 cuttings of cottonwood and willow, besides planting about a thousand small maple and ash trees, as also some apple, pear, and cherry trees. I hope all the cousins who belong to our Club will do all they can to add to the beauty of their homes. LIZZIE HAY.

Sabbath Reading.

THIS SIDE AND AND THAT.

A GODLY BALLANT.

THE rich man sat in his father's seat—
Purple an' linen an' a' thing fine!
The puir man lay at his gate i' the street,
Sairs an' tatters an' weary pine.

To the rich man's table ilk dainty comes:
Mony a morsel gaed frae't, or fell;
The puir man fain wad hae dined on crumbs,
But whether he got them I canna tell.

Servants prood, saft-fittit an' stoot,
Stan' by the rich man's curtained doors;
Maisterless dogs 'at rin aboot
Cam to the puir man and lickit his sores.

The rich man deed, and they buried him gran';
In linen fine his body they wrap;
But the angels tuik up the beggar man,
An' laid him doon in Abraham's lap.

The guid upo' this side, the ill upo' that—
Sic was the rich man's waesome fa';
But his brithers they eat, an' they drink, an' they chat,
An' carena a strae for their father's hat'.

The trowth's the trowth, think what ye will;
Ah! some they kenna what they wad be at;
But the beggar man thought he did no that ill,
Wi' the dogs o' this side, the angels o' that.

[*George Macdonald.*

CHRISTIANIZING THE CHURCHES.

EVEN those churches that may be fairly said to belong to Christ show in many of their doings a deplorable lack of respect for the fundamental principles of His religion. The social relation of many of them can hardly be called Christian. The pride and exclusiveness, the lack of friendly sympathy, the division of the body into distinct classes of rich and poor, cultivated and illiterate, between whom no real bond of brotherhood exists—all this is in direct disobedience to the organic law of the Christain church. And not only by these unseemly gradations of rank and caste, but also by the spirit that is manifested in the relations of Christians when they are brought together in the churches, is this law set at naught. There are a great many petty quarrels about small matters, and the inconsistency and shamefulness of this state of things does not seem to be recognized by many church members. Each man wants his own way, and is ready to fight if he cannot have it. In many churches there are chronic dissensions. Are these Christian churches? Look at that wrangling and raging church court now in session in Brooklyn! Is there anything in that city that more needs Christianizing than that Presbytery?

The financial methods by which these churches are often managed find no authorization in the New Testament. The principle of competition upon which the commercial operations of society rest, and which is also brought in to regulate the financial affairs of most of our churches, is not a Christain principle. And it can hardly be said that Christian principle has much to do with the secular side of our church organizations. So long as the man who has the money gets the best seat in church, so long as the whole business of distributing sittings proceeds upon a selfish basis, and the aim of each is to get for himself the best accommodations that the place affords at the lowest possible price rather than to seek the comfort and pleasure of the rest, so long as many practices of questionable honesty are resorted to for the replenishment of the treasury of the church, there will be room for a question whether these churches belong to Christ. Indeed there is nothing that stands more in need of Christianizing than the secular affairs of a good many of our churches.

It must also be said that there are certain portions of the Sunday services that can scarcely be called Christian, or even religious, in any sense. To assert that the music which is commonly heard in our churches is worship, or answers any of the purposes of worship, would be hazardous. It is sometimes good art, and sometimes it is not; but it is generally a performance; it is rarely an act of worship. And it is a serious question whether the interests of pure religion throughout the land would not be promoted by abolishing music from all our churches. If it is not to be abolished, the sooner it is Christianized the better.—*Sunday Afternoon.*

QUIET LIVES.

CHRIST'S lowly, quiet workers unconsciously bless the world. They come out every morning from the presence of God and go to their business or their household work. And all day long as they toil they drop gentle words from their lips, and scatter little seeds of kindness about them; and to-morrow flowers from the garden of God spring up in the dusty streets of earth, and along the hard paths of toil on which their feet tread. More than once in the Scripture the lives of God's people in this world are compared in their influence to the dew. There may be other points of analogy, but specially noteworthy is the quiet manner in which the dew performs its ministry. It falls silently and imperceptibly. It makes no noise. No one hears it dropping. It chooses the darkness of the night when men are sleeping, and when no man can witness its beautiful work. It covers the leaves with clusters of pearls. It steals into the bosom of the flowers and leaves a new cupful of sweetness there. It pours itself down among the roots of the grasses and tender herbs and plants. And in the morning there is fresh beauty everywhere. The fields look greener, the gardens are more fragrant, all life glows and sparkles with a new splendor. And is there no lesson here as to the manner in which we should seek to do good in this world? Should we not strive to have our influence felt rather than to be seen or heard? Should we not scatter blessings so silently and so secretly that no one shall know what hand dropped them? The whole spirit of the Gospel teaches this. "When thou doest thy alms, let not thy left hand know what thy right hand doeth, that thy alms may be in secret." We are not to seek praise of men. We are not to do good deeds to receive rewards from men. We are not to sound trumpets or announce our good deeds from the housetop.—*Dr. Bushnell.*

PERSONAL ITEMS.

Lord Beaconsfield never owned a watch or an umbrella.

Senator Gordon's sheep ranche at Ty-Ty, Ga, comprises 40,000 acres of good land.

Gov Seymour again, in formal answer to the Belmont conference asking him to run for governor of New York, announces his permanent retirement from public life.

Dr. Isaac Butt of Limerick, the well-known leader of the Irish home-rule party in the House of Commons, died this week at the age of 66. Dr. Butt was a graduate of Trinity college, Dublin, and made his career at the bar, whence he was elected to Parliament in 1852, 1871 and 1874.

For sinking spells, fits, dizziness, palpitation and low spirits, rely on Hop Bitters.

New Publications.

THE GOSPEL OF JOY!

THE GOSPEL OF JOY is a new Singing Book of unusual beauty for Gospel Meetings, Camp Meetings, Devotional Meetings and Sunday Schools.

By Rev. SAMUEL ALMAN and S. H. SPEOK. It contains a large number of new and very superior Hymns and Tunes. The general style is very cheerful and bright, as befits a collection that has so much to say and sing about

"Glad Tidings of Great Joy"

Both words and music are of an elevated character, commending themselves to persons of refined taste, and the "dancing measure" so prevalent in many recent compositions has been carefully avoided.

Price 35 cts., for which specimen copies will be mailed to any address.

See Decoration Day Music in the MUSICAL RECORD, 6c.

GOOD NEWS! (35 cts.) the genial Sunday School Song Book, has thousands of friends. Do not fail to examine and try it. There are 270 Songs, in the composition or selection of which great taste and ability have been displayed. Examine also "Shining River" and "The River of Life," two standard books of great beauty.

OLIVER DITSON & CO., Boston.

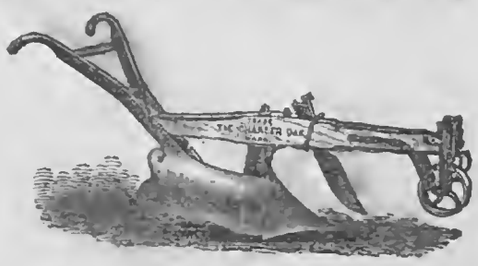
The Charter Oak Swivel Plow.



THE ONLY PERFECT SWIVEL PLOW.

WALPOLE, N. H., April 13, 1878.

HIGGANUM MF'G CORP.—You wanted to know how I liked the Charter Oak Swivel Plow No. 160. I would say that I have used it on all kinds of land, and think it the best plow I ever saw or used. I have used seven or eight different kinds of swivel plows and this beats them all in doing good work, and draws much easier. I would not exchange it for any plow I ever saw.

Yours in haste, O. J. HUBBARD.

Manufactured only by
THE HIGGANUM MF'G CORPORATION,
Higganum, Ct.

Traveling is Extra-Hazardous

If the tourist is unprovided with some medicinal resource. Change of temperature, food and water of an unaccustomed or unwholesome quality, and a route that lies in the tropics or other regions where malaria exists, are each and all fraught with danger to one who has been improvident enough to neglect a remedial safeguard. The concurrent testimony of many *voyageurs* by land and sea establishes the fact that Hostetter's Stomach Bitters enables those who use it to encounter hazards of the nature referred to with impunity; and that, as a medicine adapted to sudden and unexpected exigencies, it is peculiarly valuable. Disorders of the liver, the bowels and the stomach, fever and ague, rheumatism and nervous ailments, brought on by exposure, are among the maladies to which emigrants, travelers, and new settlers are most subject. These and others yield to the action of the Bitters promptly and completely.

THE LARGEST ASSORTMENT OF

The Naturalist.

THE FLYING FOX OR ROUSETTE BAT.

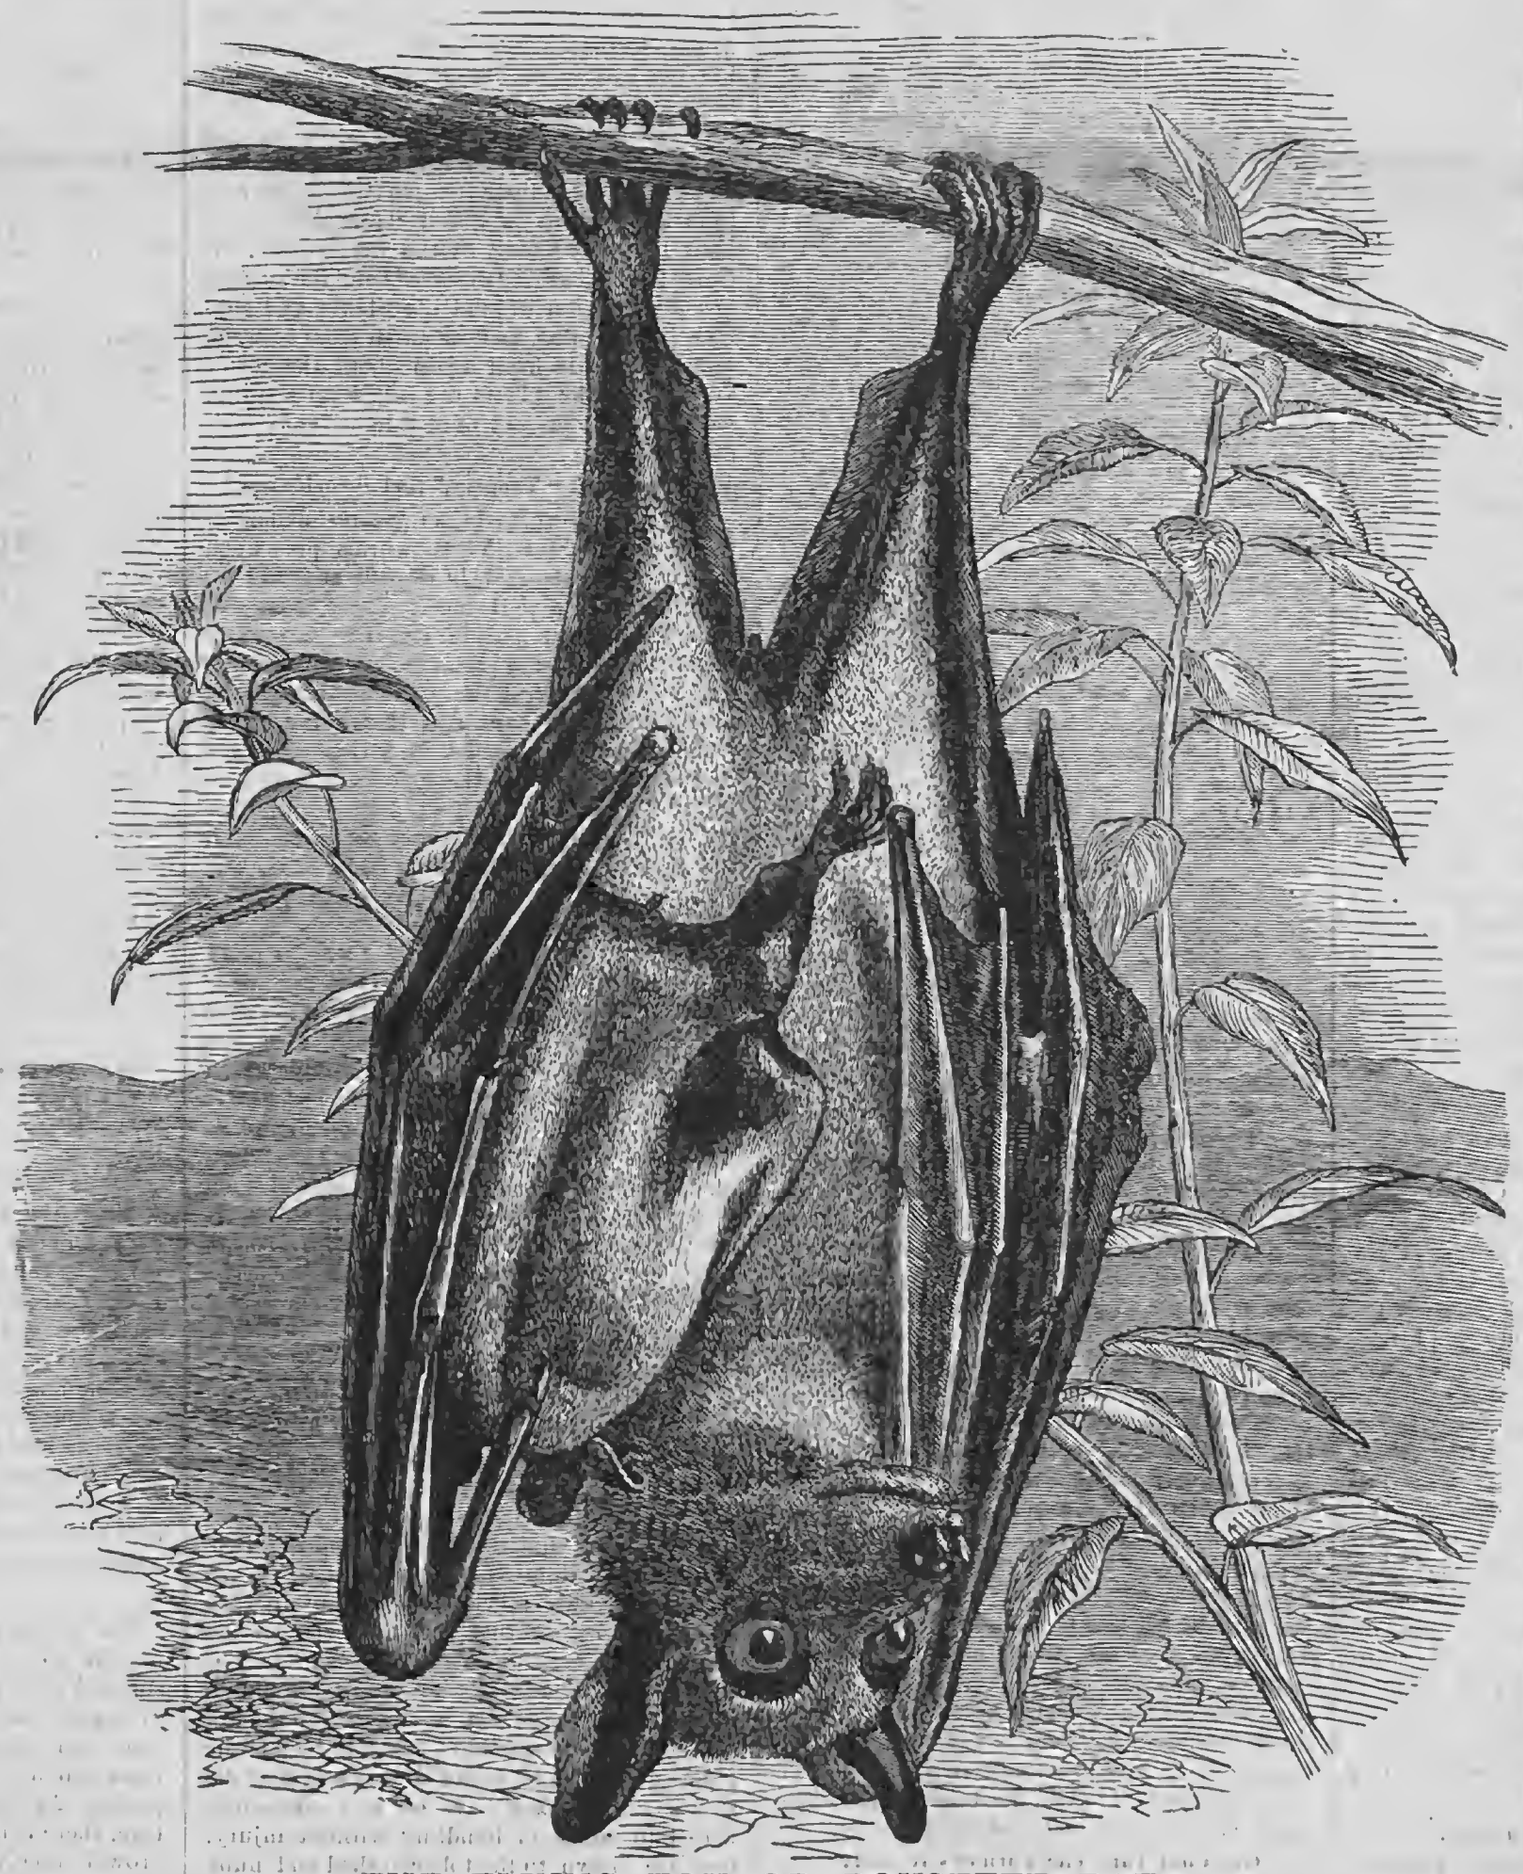
THE different genera of bats constitute the order of Cheiroptera or wing-handed animals, a term compounded of two Greek words meaning hand and wing. Common as they are all the world over, no kind of animated beings have been such a puzzle to zoologists as these strange, weird, grotesque creatures. Aristotle Pliny and other ancient naturalists held them to be birds, an opinion religiously followed by most people during the Ages of Faith and even now entertained by many persons. But just as there are always some opponents of every established belief, so from time to time there have arisen sceptics who refused to accept this classification, having a very natural preference for one of their own invention. Some of these were as quaint as the animals to which they related, such as that which placed the bat and the ostrich in the same order because one could fly and the other couldn't.

As with hundreds of other enigmas of by-gone ages, it was left to modern investigators, by careful anotomical research, to discover that the true position of the bat tribe in the scale of nature is that of mammiferous quadrupeds. In the order there are many genera, some restricted to certain circumscribed localities, others of continental diffusion, and still others to be met with in all parts of the world except the arctic regions. The most remarkable feature of the whole of them is the wide and delicate membrane, thin and semi-transparent, that serves the purpose of wings and renders them the connecting link between Birds and Mammals.

This consists of an expansion of the skin of the flanks and other portions of the body. In structure it is double, so that with ordinary care, the upper and lower surfaces can be seperated from each other. The conformation of the entire body is subsidiary to the efficiency of the wings thus formed. Very active in the air, a bat is always awkward and helpless on the ground. When it attempts to walk, the wings are shut and become fore-feet, the hook terminating one thumb is fixed to some object ahead, and by it the body is pulled forward and to one side, the next step being taken by a similar movement by means of the hook on the other thumb. The length of the wings renders it difficult and disagreeable for the animal to rise from a flat surface, and as a rule it seeks some slight elevation before beginning flight.

The diminative size of the eyes of bats is familiarly expressed in the common saying "as blind as a bat." This characteristic belongs to the active, large-eared insectiverous group whose minute eyes are placed almost within the auricle and concealed by the hair; but in the fruit-eating genera the eye is of the usual size as is also the ear. The diminative eye is compensated for by the great development of the sense of hearing. The organ of smell in many insectiverous bats is exceedingly acute. In these the nose is provided with folds of the integument of great size and most grotesque forms, rendering their physiognomy like that which would be produced by a nose turned inside out and complicated by a hare-lip. Bats have such an extraordinary development of the sense of touch, that Spallanzani was led to believe that they had a sixth sense. In his experiments he extracted the eyes of some of the creatures, stopped up their ears and noses completely, then confined them in a room across which numerous strings were drawn in various directions, and yet they all flew about among the entanglement of obstacles without ever coming in contact with any. Cuvier discovered that this exquisite sense of touch lies in the flying membrane and that the bat is made acquainted with the distance of bodies by the different modifications impressed upon this membrane by the impulse of the air.

Bats vary in size from pigmies no larger than bee to monsters nine inches long with a spread of wings fully five feet. Probably the most famous of the race is the large South American species, the Vampire, about whose deadly blood-sucking propensities so many exaggerated "travelers' yarns" have been told. Its natural food is insects, but when pressed by hunger, it will suck the blood of poultry, cattle and even man. The blood is obtained by suction from the capillary vessels, and not by any wound made by the teeth. The subject of the accompanying engraving is the Roussette or Flying Fox, one of the species of the genus *pteropus*, an inhabitant of the East Indies where it is largely used as food. A full-grown specimen is about eight inches long with a spread of wings of about four feet. According to the fashion usual among the bat family, it is snugly resting, head-downwards, clinging to a support by the sharp claws terminating its hind legs. If disturbed while in this position, it is excellently situated for immediate flight, as all it has to do is to loosen its hold and it is at once launched into the air. The recesses of a cave or a ruin are their favorite retreats.



THE FLYING FOX OR ROUSETTE BAT.

Farm Topics.

NOTES FROM THE RURAL FARM.

WE are planting corn (May 14). That for home use is upon a five-acre field—from which a large average of hay has been taken for three years past. This is one of those fields of which there are several upon this old farm—which, let the season be what it may, will produce at least a fair average yield, and in some seasons an immense one. Thus, should the summer prove wet, we shall harvest not less than 40 bushels; should it prove dry, not less than 60 bushels—perhaps a good deal more. Our land here is decidedly of three sorts. The first (upland) is a sandy-gravelly loam; the second, (midland), a mucky loam, and the third (lowland) is pure muck, yielding from two to three tons per acre of a fine quality of salt-meadow hay. The five-acre field of which we began to write, was plowed and harrowed. Then 1,800 pounds of superphosphate of lime were sown and harrowed in. Then the field was rolled with a heavy roller and the corn planted, four kernels to a hill, the hills four feet apart. Our readers will remember the request we made last year that they would send us ears of the corn which they had raised with the best success. So many were the responses of our good friends that the collection at length became one both curious and instructive, exceeding in variety any display we have ever seen at our best agricultural fairs. The best of these ears were sent here and *these we have used as seed* for the above corn-field. Of course, these many varieties will intermix immeasurably, and although we look to the result as one that will gratify our curiosity more than it promises to impart any useful lesson, yet, if it should turn out otherwise, it would not prove the first time that instruction was gleaned when least expected. In a measured quarter-acre plot of the *midland* belt we have planted our

Blunt's White Prolific.

Having been mowing ground for the past two years, 6 loads of coarse barnyard manure were spread over the sod and plowed under. Then it was harrowed each way and rolled alternately three times. The area of this plot is 132x82½ feet, and a kernel of corn was planted every 14 inches in the row—the rows four feet apart. We used what might be called a compound dibble to insure uniformity of depth and distance. This consisted of a strip of wood two inches wide 74 inches long upon which five wedge-shaped pieces were securely nailed, the points of which were precisely 14 inches apart. By a pressure of the foot upon either end of the contrivance while held vertically, the pickets were forced into the ground up to the cross-strip, making five holes two-and-a-half inches deep. Thus the entire plot was gone over. Into each of these holes a single kernel was dropped and covered over rather compactly to a level with the surrounding soil, so that

when completed and when the newly-moved earth had dried, there was nothing to indicate that any planting had been done. Instead of marking the earth, a cord, 83 feet long, attached at either end to a four-foot stake, was stretched across to guide the use of the dibble. The corn, we may mention, was first placed in hot water and tar and then covered with ashes and passed through a sieve. In this section of country, the blackbirds and crows (especially the former) are so numerous that we never feel safe without adopting this precaution which is quite effective. Our friends will conclude that this quarter-acre crop of corn will cost us more than it will be worth. Probably. But we are anxious to determine how much corn we can raise by giving it every needed care without regard to cost or trouble. It is well to determine how much it is *possible* for us to do, so that we may know how much it is wise to attempt. Besides, if by an intricate method of corn culture we find we may double the yield—perhaps the yield might still be doubled and, pursued upon the same principle, the method greatly simplified. We have sent thousands of envelopes of this Blunt's corn to our subscribers. Many of them have advised us of their intention to compete for the "RURAL" premiums. We, of course, do not desire to enter for the prizes—but we do desire that our yield should not fall far behind those yields which secure them. Holding ourselves up as instructors of the agricultural public and frankly avowing that we intend to do our best, it might cast a cruel reflection upon the proprietors of the RURAL FARM were they to be distanced by their less pretentious competitors. In another letter we shall tell our friends how our *Cultivation* of wheat progresses.

WORK FOR JUNE.

IN this lovely month the country usually puts on its most attractive dress. The warm weather pushes on vegetation and there is no lack of work. Some will be so absorbed in this that they can see little beauty in vegetation as it is displayed in innumerable forms. A little better planning; a little less hard work; work for fewer hours in the day, and a knowledge of botany would make every farmer enjoy life better. The botanist sees something to admire in every plant, and plants make all or support all that there is of much interest in any country.

Corn.

Indian corn is a beautiful plant, whether we view it in the tender blade, in the full-grown plant, or when harvested. Nothing is more useful or more beautiful than a crib well filled with good sound corn. In June, the corn should be well tended. The cultivator should start as soon as the rows can be seen, and be kept running for some weeks. The land should be well prepared before planting, and the rows be made straight, then all or nearly all the work can be done with the horse and cultivator. It will seldom be a profitable crop if much hard labor is given to it. For fodder or for using in the dry weather of August and September, it is a good custom to drill in the rows about two feet and a half apart, and then run the cultivator. The stalks grow larger; they often bear small ears and the crop is worth more. A small piece of corn for this purpose is almost indispensable on a well-managed farm.

Stock.

Stock of all kinds should now be thriving and doing their best. The sheep and lambs should be looked after every day. The swine should have some grass. Keep the calves growing by rich pasture, milk, and a little ground feed. More attention should be given to selecting and raising good heifer calves to improve the milking qualities of our herds of common stock. This should be kept up for years with a definite end in view. Good males should be used with the same object.

Making Hay.

For profit much depends on good management, and, of course, something on the weather. There are advantages in using a hay-tedder. Hay can be cured much more quickly and in good weather can be cut and drawn in on the same day. This saves cocking up, and avoids risk of getting wet. Begin to cut grass early. Professor Beal gives the following good reasons for this practice. "Stock prefer hay made of grass just before, or as soon as it is in blossom. The chemist has found that grass at such times contains a greater proportion of nutritious or digestible materials than when cut later. This plan leaves a longer time for the next growth, which may be used for pasture or for mowing again. It exhausts the roots less."

Meadows hold out better when the grass is not allowed to go to seed or to get old before cutting. Very often the crop can be well secured if cut early, while if cut late, bad weather may come on. If a farmer begins early, he has a longer time to work in case of bad weather.

Care of Trees and Gardens, &c.

Trees which have been recently planted, should be well mulched or frequently cultivated. Tie up straggling canes of Black Caps or cut off a part of the top. Mulch Strawberries to make them endure the dry weather and keep the fruit clean. For this purpose there is nothing better than clean straw worked down among the plants. If there are oats or wheat in the chaff, the seeds will grow. If old hay is employed, seeds will grow and make trouble. If leaves are employed, the wind will scatter them. Saw-dust is bad for the soil. Corn-stalks, unless chopped or cut up, are a poor material for mulching Strawberries. For a successful garden, it is necessary to plant a succession of beans, beets, corn, lettuce, peas, radishes, spinach etc. It is usually most convenient to leave a spot for each sort and so keep each kind of vegetable by itself. For cucumbers and radishes and squashes, if but few are raised, take advantage of coops of young chickens which should be brought out in season and scattered about the garden. To start melons and other vines, a depression may be made in the soil over the hills in the following manner: Plant the seeds, then place a block over the hill and pack the dirt closely around it. Remove the block by a handle attached to it. A pane of glass, or a piece of very thin muslin stretched on a frame, may be placed over each hill and left till the plants crowd it. The plants thus get a good start without trouble from any insects.

Miscellaneous.

JOTTINGS AT KIRBY HOMESTEAD.

COL. F. D. CURTIS.

Butter Cows,

WE had to go with Esquire Davidson to his stable and help him admire his Jersey cows. They are all grades, from half-bloods up to fifteen-sixteenths, and are beauties every one of them. The Esquire thinks, for a butter dairy, they are the most profitable cows a farmer can have. They are hardy and give good messes of exceedingly rich milk. People come to his house and offer five and ten cents more than the market price for his butter on account of its excellent quality. The Esquire is one of a few neighbors who have had the forethought and good judgment to send their best native cows to our Jersey bulls, and he is now reaping his reward. Mr. Heaton did the same thing, and he has a half-bred Jersey heifer, which at two years of age, made nine and a quarter pounds of butter in one week, and when three years old, from a week's milk, made twelve and a half pounds of butter. A four-year-old made in one week eleven and a quarter pounds. These are all small cows, and give milk nine months out of the twelve. These results were from grass alone. We are now making nice yellow butter from the milk of one Jersey cow, and enough of it for our family, besides using nearly half of the milk. We have seen a great deal lately about Holstein cows, but when the amount of food consumed is taken into the account, the Jerseys and the Ayrshires will be found to be ahead for profit. An Ayrshire cow has raised two calves this winter, and they are large and in fine condition.

Sick Animals, Medicines.

We had a spring lamb which stood one side in the flock and did not seem to eat. We concluded it was constipated and immediately administered a tablespoonful and a half of castor-oil, with a teaspoonful of sweet spirits of niter, mixed with a gill of milk. The lamb was put in a clean crate by itself, and the next day, there being no evidences of a passage from the bowels, an injection was given which brought no relief. The lamb had refused to eat for three days. Another dose of oil was given, and two gills of milk poured down its throat. In the evening more milk was given, and the next morning the bowels had moved and the lamb began to eat, and was soon well again. It would have died but for the repeated doses of castor-oil. The lamb did not bloat but was gaunt and growing weak very fast. Spring is the season when animals are very liable to be constipated, and every farmer should be on the lookout for this kind of trouble, and treat every case as soon as discovered. The next stage for constipation is inflammation of the bowels, and when this condition is reached, a cure is almost impossible. Constipation is the natural result of a long diet on dry food. A farmer should have his medicines on hand and ready for use. He should always have castor oil, which is the best physic for young animals, and where there is any cold or inflammation, the best for any animal. There should be Glauber salts for the horses, as they act both on the bowels and kidneys, and small doses, a table-spoonful every day, are excellent, nothing better to tone up a horse's stomach and help to put him in good condition. A farmer should never be out of niter, mustard, alcohol, good liniment, laudanum, carbolic acid, and, last but not least,

Gas Coal Tar—The Farmer's Remedy.

This is our sovereign remedy for all cuts and wounds, and is the best cure for all kinds of sores. It is the cheapest and most efficacious application which any one can use. If applied to a fresh wound, however severe, it will prevent the growth of proud flesh, and promote healthy granulation. It coats over a flesh wound or cut with an adhesive covering which keeps out the air and prevents smarting or pain. It will keep the flies away, and is self-adhesive. The best way to buy it is by the barrel. It is a durable paint for tools, fences, a hay rigging, a farm wagon, or anything exposed to the weather. Wood will last a great deal longer when painted with it. It should always, when used as a paint, be put on hot. It is a durable and preserving paint for an iron fence. A barrel of it should not cost more than $1 50.

CASH vs. CREDIT.

A FRIEND, living within a few miles of Cincinnati, O., writes us as follows: "We have a neighbor who must fail before long, his farm being mortgaged. He also owes many people, and keeps them from pressing him too hard by paying them a little now and then. Nevertheless, he can buy, and has this spring bought farm implements, on time. Those he has bought this spring cannot have cost less than $200. Now the injustice is that as he does not intend to pay in full, he can and does sell his early truck at a lower price than his prompt-paying neighbors can afford to sell for. I hope that your articles, Cash vs. Credit, may induce him to compromise with his creditors, and begin again upon an honest, cash basis."

Field Crops.

TOBACCO CULTURE.—No. 3.

O. GOFF, JR.

Cultivation of Young Plants.

TOBACCO requires thorough and frequent cultivation. About one week from the time the plants are set, or as soon as they have commenced growing, the cultivating should begin, and it should be continued at intervals, as long as the work can be done without injuring the leaves. Especially is cultivating important in dry weather, as there is no better remedy for drought than to keep the surface of the soil mellow by frequent stirring. The best growers hoe their tobacco twice. The first time the process is called "scraping," and should begin as soon as the weeds start. It consists of skimming the weeds and the surface of the soil, from around the plants, and substituting the fine, mellow earth from between the rows. It is hoed again about the 1st of July, when the plants are hilled up slightly, and the "extras" not needed to fill vacancies, removed.

"Worming," "Topping," and "Suckering."

The tobacco-worm is the greatest enemy of the tobacco plant. These worms prey upon the tobacco in the months of July and August, and the utmost vigilance is necessary to prevent them from greatly injuring the crop. "Worming" tobacco, is a task requiring much time and patience. Each row should be passed over as often as once a week, and the leaves examined for the worms. A little experience will enable one to tell where they are most likely to be found. Turkeys will devour the worms greedily, and are very useful to aid in the work of hunting and destroying them. The chief reliance must, however, be in picking them off by hand.

In order to throw the energies of the plant into a few large leaves, the top is broken off at the time of flowering. This process is called "topping." It consists of breaking off the flower, with a few of the upper leaves which cannot become fully developed. Experience is required to tell just how much of the plant should be taken off, as it depends, somewhat, upon its strength and forwardness. As soon as the plants are "topped," suckers will start out at the base of the leaves, which, if allowed to grow, will also form buds and blossom. The plants should be gone over at least twice, and all the suckers removed.

Cutting.

About twelve or fourteen days after the plants are topped, they should be fit to cut. Experience is required to tell the exact time when the tobacco should be harvested to yield the best results. All good growers agree that it is important that the cutting should be done at the proper time, as delay even of a day will sometimes cause much loss. When ripe, the leaves become spotted and the color of the lower leaves turns brown. The plants are cut with a hatchet and laid upon the ground to wilt, but they must not be exposed to the hot sun. Great care should be taken to handle the plants carefully, so as not to break or tear the leaves. When they have become sufficiently wilted to admit of handling without injury, they are drawn to the tobacco shed and hung up to cure. The cutting should be done principally in the morning and evening, to prevent "sunburning." It is not safe to leave plants cut upon the ground between the hours of ten in the morning and three in the afternoon on a hot day. Only as much therefore should be cut in the morning as can be taken care of before ten o'clock, when, if the sun shines hot, the cutting must be suspended until two or three in the afternoon.

Curing.

The plants are hung in the shed upon poles, with twine. The poles are placed as near each other as possible still permitting a free circulation of air—usually from twelve to eighteen inches apart. The ends of these poles rest upon joists, which are placed from four and a half to five feet apart. The tobacco sheds are built so as to receive three or four tiers of these poles on which the plants are suspended. A free ventilation is secured from the sides of the building by having the boards placed vertically, and every third or fourth board hung on hinges. The building also should admit air from beneath. Ventilators are placed in the roof to further encourage a circulation of air when needed. The size of the tobacco shed should vary with the number of acres cultivated. A building 48 feet long, 28 feet wide and 16 feet high, will receive three tiers of plants and will store the tobacco grown on two acres. There is doubtless much yet to be learnt about the curing of tobacco. The natural laws that govern it are not well understood even by our best growers. Many different opinions exist on the subject, but it is the common belief that tobacco *can* have too much air during the process of curing. The important question yet to be answered, is: How may the tobacco be cured so as to insure good colors and still escape the danger from "pole-burning?" If the drying is too fast, the colors will be too light, and without proper ventilation, loss from "pole-sweat" will almost surely occur. The method followed by our best growers is to keep the doors of the tobacco shed open except in dry or windy weather. Tobacco will cure in about three months from the time it is harvested. When it has become thoroughly cured—which is known by the stems of the leaves becoming free from sap—it is taken down and piled in a double rank, with the butts of the plants extending outward and covered over to prevent drying. This work is done in damp weather when the leaves are soft and pliable. The leaves are next stripped from the stalks and tied up in small bundles and carefully packed away and covered over, where they remain until assorted. It is better to do the stripping in damp weather, as it is essential that the tobacco should retain its moisture.

Assorting the Tobacco

furnishes the grower with pleasant employment at a time of the year when he has little else to do. The work is usually done in the winter in a tight room built in, or adjacent to, the shed. This room is made comfortable by a fire and provided with benches or tables on which the tobacco is assorted. A kettle of water should be kept on the stove, the evaporation from which will prevent the air in the sorting-room from becoming dry. The leaves are handled over one by one, and sorted into different qualities and carefully packed away and covered with boards or slightly dampened carpets. From twelve to eighteen leaves are tied together, which form what is called a "hand." Four qualities are usually made, viz: first and second wrappers, binders and fillers. It is important in handling tobacco that it should be kept from drying. It is unfortunate if artificial moistening is ever required, as it occasions unnecessary labor and danger. If the tobacco is in proper order when it is taken down from the poles, and not allowed to dry while handling, it will not need further moistening. But when it is necessary to dampen it, much care and judgment must be used. The water must be used sparingly, and, put on in a very fine spray, so that it will not spot the leaves.

Packing.

When the tobacco has been assorted it is packed in cases, each quality by itself. This work should also be done in damp weather. From 375 to 400 pounds should be pressed into each case, and the tobacco should be in proper condition as regards moisture when the "packing" is done. Some growers assort their tobacco as it is stripped from the stalk. This is the more rapid way, and with small or poor crops, perhaps the best; but it is then almost impossible to do the work as well, and therefore it is not usually considered the best way where the work needs to be well done.

Profits.

The tobacco in this valley is principally bought up by New York houses whither it is shipped when prepared for market. A number of buyers usually come here at about the same time, and some competition is formed among them which enables the growers to get better prices. As regards the profits of tobacco culture, there is much to say. The prices which growers receive for their crops have been and probably will be subject to great fluctuations.

The readiness with which tobacco has been sold for the past ten years, while the market for nearly all other farm products is so stagnant, will cause a decided increase of acreage for the coming crop. It is to be feared that a time is approaching when the price of seed-leaf tobacco will reach lower than for many years past. The tobacco business requires a considerable outlay of capital, and it will not pay for farmers to invest in the necessary outfit unless they propose to make it a permanent branch of their business. Our best farmers are learning that it is not best to strive to produce the largest possible number of acres; that a few acres with good culture and proper management, will give more profit than a large number of acres which suffer from want of proper care. Doubtless the best rule for growers to follow is for them to produce no more tobacco than they are able to thoroughly fertilize with barnyard manure and to give such culture and care as to make it of the best quality. Managed in this way, we have found that tobacco does not exhaust our soil. The heavy manuring and thorough cultivation which the crop receives, leave the soil loose, friable, free from weeds, and in excellent condition for other crops.

The cultivation of tobacco will be found more profitable in localities where the business is already followed to a considerable extent. In such localities there is usually some competition among buyers, which is a decided advantage to the growers. The demand for the best qualities of tobacco will probably continue, even though the market for the lower grades may fail. A few acres of the best part of the farm devoted to this crop, with extra culture and proper management, so as to obtain a large percentage of good sound leaves, will doubtless prove remunerative. The prices that have been paid for tobacco during the past five years, in the Chemung valley, range from ten to fifteen cents per pound for running lots, according to quality, without much fluctuation. The yield received per acre varies all the way from 1,400 to 2,000 pounds, according to the condition of the soil and culture given the crop.

Chemung Co.

RAISING AND HANDLING BEANS.

I WOULD like to give through the RURAL the method most commonly practiced hereabouts of handling a crop of beans, and in so doing I will give my experience with seventeen acres.

Planting and Cultivating.

The ground, which is a sandy loam, was plowed right after corn planting, harrowed until it was in good condition and immediately drilled on the 24th and 26th of May with a grain drill using 40 pounds of seed per acre, the rows being 35 inches apart. To the drill I attached a plank which was dragged after it on the ground, leaving the surface smooth and making it much better to cultivate while the beans were small. As soon as they were fairly up, I started a small cultivator with shield attached to the side next to the row and running close to the ground, to prevent lumps from falling on the row. By working slowly and carefully a good job can be done in this way, while the vines are very small, which I have found to be a great advantage in keeping the start of the weeds. I cultivated three times, finishing while the beans were in blossom, and as no more culture was given, they ripened early and quite evenly, which is a great advantage, as they can often be put on the market early and sold for nearly twice what they would bring two or three months later on.

Gathering and Thrashing.

The dry weather shortened this crop to a considerable extent while the beans were setting; but they were ripe enough to commence harvesting the 12th of August, and were gathered and thrashed with flails at an expense of $25. This expense could have been reduced at least four dollars, if the weather had been as favorable as it commonly is at that time of year, but it was a bad season with very few hot, sunny days. My method of gathering the crop I consider more easy and expeditious than by pulling. I started a man and team with a plow without wheel, as that would shell the beans, the team spreading the row and the plow running an inch and a half or two inches deep, just deep enough to cut the roots but not to turn a furrow. The vines will slide to one side and stand almost in the same position they occupied in the row, leaving them in nice shape for the "hands" to follow with forks, gathering them up and throwing three or four rows in one. I consider it an object to have plenty of help and drive this business when the weather is favorable. If the beans are quite ripe and the sun bright and warm, they can be dug in this way in the forenoon and thrashed very fast in the afternoon. I have known one man to thrash three acres in half a day, but it was exceptionally fast work. Thrashing usually costs from three to five cents per bushel. The beans having been thrown in small windrows, a team with wagon was driven between them, a hand loaded from each side and the load was drawn to the barn where four men thrashed the crop on a double floor. Managed in this way, the work is lively, and a set of hands will thrash in the afternoon what they can dig and gather in the forenoon.

Marketing.

I think it a good plan to allow the beans to lie in the chaff two or three weeks, but in this case I had an offer for them as soon as they were thrashed, and, cleaning them through the fanning mill, they were straightway drawn to market. They yielded twelve bushels per acre and I received $1.92 per bushel for them. My book shows that I received money for them Aug. 25th, making only three months from the time of drilling until I had the money in my pocket. There are not many crops from which the returns come so quickly. A short time after I sold my crop the market dropped, and in the winter beans were only worth one dollar a bushel. I wish to show by this that it is well to have them ripen early, and necessary to thrash them as soon as the weather will permit, in order to take advantage of any market which may be open for them.

Remarks.

I should have said that this ground was corn stubble, and I think we can insure the ripening by a suitable selection of ground and proper cultivation. The only bean crop I have ever raised that failed to ripen early, was on a June-grass sod. I am very chary of bean straw, as I consider it worth fully as much as clover hay for sheep, and I have never fed them anything they seemed to relish as well.

ECONOMY IN HORTICULTURE.

E. P. POWELL.

As a rule there is no economy in crowding crops; that is, berries do better without having vegetables between the rows, and can be kept in better cultivation. But there are plans for encouraging labor in the garden, that are seldom practiced. For instance, plant with your early potatoes your early peas; say the Early Rose potato and the Alpha pea. This pea will grow to about the hight of two feet. It will not be in the way of the first hoeing, which should be very thorough and a partial hilling. Neither will it be in the way of the plow, which should do the final hilling about June 1st. It now falls over the side of the drills or hills, and will be ready for picking about June 20th. By this time set your celery plants in the furrows between the drills, and let them get a good start by the time the potatoes are taken out for early use. The pea vines are then pulled and fed out; the potatoes dug and the trenches utilized. The dirt is also ready to hand, as soon as the potatoes are used, to be drawn up to the celery. In this way three crops are taken from one piece of soil. The labor is, at least, one-third less than what it would otherwise be; I think even less. There is, in the same way, no difficulty in disposing of our early beans in the same hills with our sweet corn.

There is but little economy in buying a lot of expensive tools and improved machines which cost more than all the vegetables or crops will return for five years. As a general thing, few tools are used, and the most of them are in the way. But every gardener needs a light one-horse plow, an adjustable cultivator, and trowels to assist in planting and weeding. Weeding should invariably be done, trowel in hand. The trowel loosens the soil where the hoe cannot be trusted, at the same time removing the weeds. The economical rule is—buy few tools, but buy those you learn from experience that you need. Never borrow and never lend.

Economy of time also requires that the gardener or farmer keep a memorandum of what is to be done. He should have this always in his pocket, and jot down what he sees will be required. Let him then each night mark his work for the next day, and he will find at the end of a month that the little odd jobs, instead of having accumulated, are strangely decreased, and have been worked off without observation or worry.

There may also be a large saving of time in the method of culture of many of our vegetables and fruits. For instance, we may save the expense and trouble of poling our Lima beans by growing them low, like bush beans. They will require no more pinching in than by the old method, and will give about the same crop. Raspberries may be grown two feet high, or a little more, and built up into snug shrubs, thus saving stakes and wire. They are more easily handled and bear equally well.

In keeping up an ornamental homestead, hedges add greatly to the beauty, while they enable us to grow many trees otherwise too tender, serving as wind-breaks. But most hedges require so much toil to keep them in order that they become unsightly or a positive incumbrance. The Buckthorn, so fine in all other respects, must be trimmed when we are sure to be very busy in regular farm work. But the Tartarian Honeysuckle, the Arbor-vitæ, the Hemlock, make no sharp demands upon us. I know of only one shrub that needs no trimming and is always a beauty when grown as a hedge; I mean the Tartarian Honeysuckle. The evergreens named above can be trimmed at almost any season, and clipped as well with a sickle as with shears.

The above hints are meant only as a finger-post to point in the direction of economical horticulture. The experienced and thoughtful grower has learned a long list of time-saving expedients that in no way shirk the requirements of honest work.

OKRA (Hibiscus esculentus).

THIS vegetable, so highly favored in the South, so healthy, nutritious and of easy culture, is totally unknown to thousands of Northern families, while a Southern dinner—in season—without it, would be considered incomplete. Served as soups, with green corn and tomatoes, it has no equal; nor has it when stewed, fried, or prepared in many other ways. It is also cut in rings or sliced and dried for winter use.

The Okra is a tender herbaceous annual, resembling the Hollyhock plant, bearing its flowers and edible pods, like it, in the axils of the leaves. The flowers, also, in shape and size, resemble that of the single Hollyhock. Its color is a creamy white, and it is related to both the Hollyhock and the Cotton plant. The culture of Okra is a simple field culture, and since it feeds principally on mineral matters, it requires as fertilizer but six hundred pounds of good wood ashes or four hundred pounds of some good commercial fertilizer to the acre. The soil for Okra should be light and warm. It should be broken deeply, as early in spring as practicable, with spade or plow, as circumstances demand. The fertilizer should then be scattered and harrowed in. As soon as soil and weather get warm enough to plant corn and beans, the land is laid off in rows three feet apart, and the seed—having been previously soaked—is planted from four to six inches apart, according to its quality. It would be proper here to remark that the seed does not germinate freely, and under unfavorable conditions, such as cold, wet weather, it will frequently rot in the ground. As soon as the plants are three inches high, thin to eighteen inches. All that is now requisite till frost is a clean, shallow culture.

As soon as the pods have attained two-thirds of their full size, they are ready for gathering. This is done at first once a week; later, twice, and when the plant is in full bearing, as often as once a day, in order not to allow the pods to get too old and tough. The pod is in proper condition for gathering when it breaks easily from the stalk, or when its point breaks when held under a light pressure of the thumb. The rough, hairy surface of the plant is very irritating and produces a burning sensation, and persons with tender skins, when gathering Okra without gloves, frequently get swollen hands from its effect. Where the skin is exposed, this burning may be partly or wholly relieved by bathing the hands in strong salt water.

Floricultural.

DAHLIAS.

THOUGH rather a coarse flower for cutting, the Dahlia, if properly grown, is a very showy plant, and is very desirable in some situations. It is very easily grown, though many are not at all successful with it. Those who dig a space six inches square in the middle of a grass plot, and in it plant roots which have been started in the house or hot-bed in February or March, sometimes leaving a dozen stalks in a cluster, need expect no success whatever. The tubers should not be taken out of the cellar until May; then they should be cut up with only one eye, if possible, in each piece. These should be planted in a rich soil—I have never found it could be made too rich—two and a half or three feet apart. A stake should be driven by each one, with the label attached, and when the plants are grown, they should be tied to the stakes with strips of cloth. Hoe them to keep the weeds down and to loosen the soil. Dahlias will not succeed near grass.

My Dahlias yielded last year a larger crop, according to the number of hills, than my husband's potatoes did. Last winter our cellar was colder than it had ever been before and my tubers froze. They will not bear a touch of frost. It is said that the best way to preserve the tubers is to stow them away beneath potatoes in a frost-proof cellar.

LORETTA E. K. TURNER.

WHAT AILS MY CALLA: IT WON'T BLOSSOM? is a question often asked of me by my neighbor lady amateurs, and to which I almost as often answer, "It needs a far smaller pot and a much more porous soil." But as different cases may require different cures, I will merely mention the treatment appropriate to Callas generally: When you repot your Callas, say in August or September, put the biggest crowns into one pot and the smallest into another, using small pots in preference to large ones, and drain them well. For soil use a rough, open spongy but rich material, that any amount of water cannot clog. Endeavor to get the pots well filled with roots before winter sets in, and give water liberally. Promote a stocky growth by free ventilation and a sunny place near the glass. If they have grown rankly, so much the better, as they will have male roots in proportion to their crops, and when they taste starvation then they will blossom. When flowers appear and you are satisfied the roots have consumed the fatness of the soil, a mulching of manure, or occasional waterings with manure water will enhance the quality and quantity of the blooms and maintain the vigor of the herbage, but under no circumstances should stimulants be applied to flowerless plants. The wide-spread notion of setting Calla-pots in saucers filled with hot water, and of applying scalding libations as you would ordinary waterings, with the view to forcing the Callas, and the like, are the most ridiculous nonsense, a libel on vegetable physiology, and murderous cruelty to the subjects operated on.

Entomological.

EXTERNAL PARASITES.—No. 3.

Lice.

AMONG hemiptera we have, as external parasites, the nasty, disgusting and too common bed-bugs (Cimex lectularius, Linn) and the even more repulsive lice. As I am not treating at present of the human parasites, I will only say that the bed-bug is exceedingly tenacious of life, as they have been kept in glass bottles for years without food, and through all this long fast seemed to lose none of their activity or appetite. The best remedy for bed-bugs is a free use of the thoroughly rectified benzine. This will not injure bedding and is quick death to all the bugs that it touches. It should be poured into all suspicious crevices. Old houses that harbor these obnoxious pests should be closely shut up, and then thoroughly fumed with burning sulphur, which becomes a fitting insecticide for the bugs. It would be better if the house were entirely empty during this operation. Thorough ventilation should succeed the fumigation.

FIG. 1.

BED-BUG, MUCH MAGNIFIED.

Louse Family—Pediculidæ.

The parasitic lice (Fig. 3) of man and other animals are apterous bugs. The head and thorax are small and narrow, the latter indistinctly segmental, while the abdomen is flask-shaped with its nine rings often plainly marked. The eyes are simple and very small; the antennæ five-jointed and prominent, while the tarsi or feet are two-jointed, the last joint of which (Fig. 2) is modified into a hook for grasping the hair. The sucking tube of lice—the *casus belli* of most of the hardest scrathing of the world—is very complex and curious. The whole of this organ, when not in use, is drawn into the head. So all lice are criminals in the sight of the law and subjects for conviction on the ground of bearing concealed weapons. The lower lip is thrown out, as we would push out the finger of a glove that was drawn in upon drawing the glove from the hand. Inside of this are numerous hooks which, when the tube is rolled out to its utmost, attain the outside and point back like the barbs of a fish-hook. When these barbs are pushed through a sweat pore, each hooks on to the wall. We thus understand the tenacious hold which characterizes a louse while at dinner. When, preparatory to sucking, the hooks have been duly adjusted, two other tubes, one within the other, spy-glass-like, are extended, the maxillæ, forming the inner or terminal point of the extension, and the mandibles the remainder. The whole proboscis has been compared to an elastic probe. This is forced into the skin till it pierces the blood vessels, when by the forcible action of the strong muscular sucking-stomach, these ir-

FIG. 2.

FOOT OF OX-LOUSE.

repressible blood-suckers are enabled to take a quick meal.

There are three species of lice that disturb the peace and quiet of the human family. The head louse, (Fig. 3) Pediculus capitis (De Geer), is the most common. It is said that in old times it was thought no disgrace, but fashionable and desirable, to harbor and nourish the crawling pigmies of the head; now they are only common among such people as neglect personal neatness. The most cleanly person may be so unfortunate as to possess specimens not pinned in an entomological cabinet, but he will soon banish them according to the fashion well understood in all civilized society. The Grayback, Pediculus corporis (De Geer) is not confined to the head, and was the irritating pest of our brave soldiers in the late war. It is apt to be a source of annoyance in lumber camps and on shipboard. This species is so like the head louse in appearance that were not the habits so different, we might almost regard them as identical. The Crab-louse, Phthirius pubis (Leach),

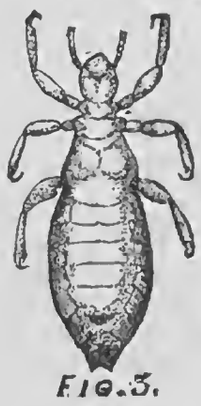

FIG. 3.

HEAD LOUSE,

FIG. 4.

CRAB LOUSE.

receives its common name from its close resemblance to the crab, and its specific name from the region of its attacks.

Both of the last-mentioned may be banished by the use of a little mercurial ointment, which is a poison and should be used with care, or of kerosene and sulphur, which are to be applied to the part of the body attacked. As the eggs will continue to hatch for a time, the application will need to be repeated at intervals of six or seven days for two or three weeks. Cleanliness is the great preventive, which in this case is certainly better and vastly more pleasant than cure.

The genus Hæmatopinus includes, among many others, the cattle louse, H. vituli (Denny), (Fig. 5), the horse louse, H. euristernus (Denny) the hog louse, H. suis (Leach), and the dog louse; H. piliferus (Denny). In form these are much like the common head louse. The five-jointed antennæ are stout, the eyes are very minute, the head obtuse in front, while the posterior legs are the longest.

FIG. 5.

CATTLE LOUSE.

Bird Lice—Mallophaga.

These lice, although the sucking tube is replaced by jaws, are nevertheless degraded Hemiptera, or bugs. The body is flat and horny, the head is broad, the antennæ, four-jointed. Unlike other bugs, they have both maxillary and labial palpi. The species are very numerous. Nearly all birds have one or more species to annoy them, while the hen has five or six.

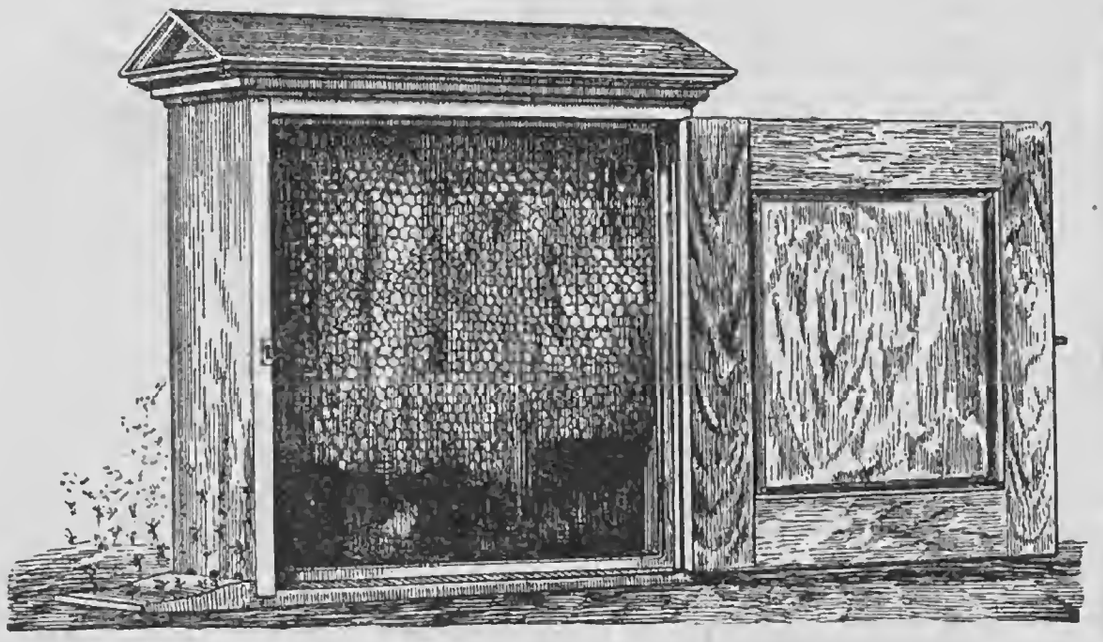
Remedies.

The washes already described for fleas are also efficacious in destroying lice. If the decoction of tobacco, or the kerosene and water, is to be used in cold weather on cattle or calves, especially the latter, they should be kept in a warm room, or well blanketed until thoroughly dry. If an ointment made of sulphur, lard and kerosene, be applied to the heads and under the wings of fowls that are annoyed with lice, the latter will soon disappear. The nests should be sprinkled with sulphur, the roosts washed with kerosene, the house and yard sprinkled with carbolic acid solution, and the poultry house frequently whitewashed. Persian Insect Powder dusted onto, or rubbed into the hair and feathers of animals attacked by lice, will destroy the pests without harm to the animals. Ointments may be easily applied with the common brushes used in grooming horses. No good farmer or fancier will allow his animals to suffer from these enervating parasites, if he but knows of these cheap and effective remedies. During the past season I permitted my poultry and their house and yard to be overspread with countless myriads of these foes to comfort and prosperity—purposely permitted it—that I might learn by actual test, of the difficulty of procuring a riddance. In a few days after inaugurating the measures suggested above the disgusting pests were wholly banished. A little care will work entire prevention; while but little labor is required to work a radical cure.—[Drawings by S. Upton. EDS.]

The Apiarian.

PROTECTION AGAINST STINGS.

PERHAPS the greatest obstacle to a more general adoption of bee-keeping for recreation and pleasure, as well as for profit, is the dread most persons have of the sting of the bee. To

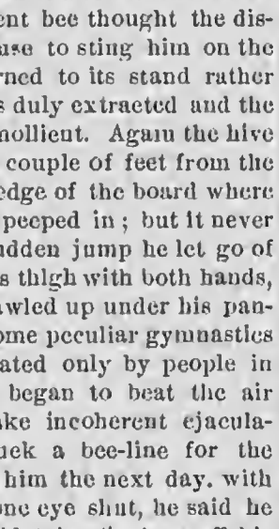


the nervous amateur it is, indeed, anything but encouraging when he suddenly finds himself surrounded by thousands of infuriated bees that madly dart at his face and hands, and hardly touch the skin before that keen, penetrating, painful sensation is felt, which seems entirely to control the action of the nerves. On such occasions one must keep cool. To strike at them only augments their fury, yet this is too often the remedy to which the amateur resorts.

We once knew a venerable gentleman who had been seized with a sudden enthusiasm for bee-keeping, and, acting on the impulse, he purchased a few colonies with a view to experiment. We happened to be present when he made the first examination of the new-comers the day after their arrival. With more eagerness than caution he attempted to lift the box-hive in his arms, desiring to look in from beneath. Having raised it a few inches from the ground, an impudent bee thought the disturbance sufficient cause to sting him on the hand. The hive returned to its stand rather quickly; the sting was duly extracted and the spot rubbed with an emollient. Again the hive was lifted, this time a couple of feet from the ground, almost to the edge of the board where it should rest while he peeped in; but it never got there, for with a sudden jump he let go of the box and grasped his thigh with both hands, an intruder having crawled up under his pantaloons. Then, with some peculiar gymnastics that can be well imitated only by people in similar situations, he began to beat the air with his hat, and make incoherent ejaculations, and finally struck a bee-line for the house. When we met him the next day, with a deformed face and one eye shut, he said he wished somebody would take the bees off his premises.

Such is, indeed, too often the experience of those who neglect to protect themselves. Everybody to whom the sting is painful, and especially those on whom it causes a swelling, should wear a good bee-veil when working among the bees, such as the one shown in the engraving. Then nobody need carry about a swelled face and a resentful spirit.

The veil should be made of some strong but sheer fabric, and be black or brown, as it tires the eyes to look through a white veil. It can be sewed to the rim of the hat, as is the case in the engraving; or it may be supplied with a rubber cord, that can be pulled over the crown of the hat; it can then be removed when not in use, thus making any hat one happens to wear, serve as a bee-hat. The lower end of the veil is most conveniently gathered in under the coat.



To protect the hands, gloves can be worn, though after some experience one generally finds that they can be dispensed with. India-rubber gloves are manufactured for the purpose, and can be obtained from dealers in apiarian supplies. To prevent the bees from crawling up under the pantaloons, it is a good plan to put these inside the boots or to tie a a cord around them at the ankles. The poison is an acid, and can sometimes be neutralized, and the evil effects of the sting prevented by applying strong ammonia or a solution of soda in water.

Another little contrivance which affords as much interest as instruction, and one which every beginner in bee-keeping should have, is an

Observing Hive.

The accompanying engraving gives a faithful representation of one used by Professor Cook, of Michigan Agr'l. College, in his observations. It is simply a miniature hive, large enough to hold three frames. The sides are doors that can be opened and shut at pleasure, and inside each is a pane of glass through which the observer can look at the bees when the door is open. The hive measures twelve inches long and five inches wide inside, allowing room for three frames, each one and a half inch wide. Anybody who can use a saw and drive a nail can make an observing hive. Make each of the inside dimensions half an inch longer than the frames that are to be used, and make it wide enough to hold two or three frames. The upright end pieces can be grooved or simply nailed to the bottom-board. To give it more rigidity, a strip the length of the hive and one and a half inch wide, should be fastened at each side at the top between the end pieces. The panes of glass can next be inserted, the doors hung, and a movable cover fitted to the top. In such a hive one can observe the whole mystery of the interior workings of a bee-hive. If a couple of frames of comb, one of them having some worker-brood and eggs, are inserted with a few hundred bees, the latter will not only remain, but they will go to work to rear a queen from one of the eggs or young larvæ. When the queen is hatched and fertilized, she will begin to lay, while the workers will build comb, gather honey and pollen and attend to the brood, operations which can all be seen. The hive can be placed in any convenient place; on a table in the garden, on the piazza, or, better still, on the sill outside one's window. There is no danger that the bees will attack anybody in the room when the window is opened, and such a position affords excellent opportunity to observe their work.

Pomological.

CLOSELY-PLANTED ORCHARDS.

WHEN we plant another orchard—if we ever do so—we shall set the trees nearer each other than we have done heretofore. An orchard should never be expected to produce a grain crop in addition to the fruit, after the trees become large. We think twenty-five, instead of thirty-five or forty feet each way, to be nearer the most profitable distance—and this question of profit, is the one the small farmer must consider. In our experience we have found low-trimmed trees the most productive. And how is it possible to cultivate a crop of any kind in an orchard of low-headed trees, even if they are set at a distance of two rods apart.? Let the land calculated for an orchard, be used exclusively for that purpose, and more clear cash will be realized than when too much is expected of it.

Another serious mistake that many farmers make when selecting trees for an orchard is, that they choose too many varieties. Where only enough are grown for home consumption, this may not be disadvantageous, but where the farmer intends ultimately to make of his orchard a constantly increasing source of revenue, he commits a grievous mistake. When they are of one variety mainly; that is, of winter fruit, there is much less labor required to put them in presentable shape for market, and a much more ready and profitable sale is made. Besides, the trouble of keeping the different varieties apart is avoided.

A properly managed orchard is, without doubt, the surest source of income to its owner. In some seasons, like the last, there may be exceptions to this. Yet even during the past season apples have been a paying crop. A neighbor of mine shipped his apples at one dollar per barrel. That was a very low price for fine fruit, yet the result showed a good profit and the advantage of closely-planted trees. On an acre 108 trees may be set 20 feet apart. At the low average of four barrels to the tree, we would have 432 barrels from an acre, at one dollar per barrel. We can raise no other crop with so little care, which would give returns so large. Now, supposing the trees to be planted at a distance of 40 feet from each other, we could get only 27 trees on an acre, and in the same proportion as the others, only 108 barrels of fruit. The objection may be that the trees will not bear as well if set close. It has been our experience that they will, until twelve or fifteen years after planting, when, should the branches become interlaced, every alternate tree may be removed. All things considered, we deem closely-planted orchards the most profitable. Moreover, the trees are less liable to injury, for they furnish for themselves a protection.

HECTOR BERTRAM.

Ornamental Quince as a Stock for the Pear.—Paradise Stock for the Apple.

WE take the liberty to publish the following remarks made in a private letter by Mr. Charles Downing in answer to our inquiries:

"I have never tried the ornamental Quince as a pear stock, and know nothing except what Mr. Strong has published. It is worthy of a trial, and I see no reason why it should not succeed. As to the Paradise stock for the Apple I never made but one trial which was not successful, mostly, I think, because I did not know how to manage them properly, and think I could do better with another trial. They require much time and are only fitted to the amateur and for small gardens. One orchard tree will give more fruit than twenty of these dwarfs, and with much less labor.

The Poultry Yard.

A CHEAP DRINKING VESSEL FOR YOUNG CHICKENS.

So many and so varied are inventions in this line, that anything more seems almost superfluous. Yet something that can be made by any one, and is within reach of all, never comes amiss; especially so in these days of economical expenditures.

None of the various so-called water-fountains is adapted alike for old fowls and young chicks, although most all of them may be used for both. The writer's experience has led him to devise numerous drinking vessels designed to keep young chicks from getting into the water, as they are sure to do if given an open pan or similar vessel to drink from. The above has been in use now two seasons, and "improves on acquaintance."

The materials and tools necessary are two old fruit or preserve cans, a pair of tinners' snips and a small hammer. Cut one can off, one and a half inch from the bottom. In the other, simply remove the opened end, leaving the sides as near full-length as possible. Cut the side into strips of three-fourths, and one or one and one-fourth inch wide, alternately, to within one and a-half inches of the closed end: cut off the three-quarter strips, leaving only enough to turn in; turn this down smoothly with the hammer. To use, fill either end with water and invert the other over it, always letting the cut ends go *inside* the rim of the other.

This width of opening—three-quarters of an inch—is enough to admit the heads of the chicks until they are a week to ten days old. If made an inch wide, some of them will squeeze through and get into the water. After the first week, give them one with larger-sized openings. The same device may be used for feeding. It is quickly and easily filled; as quickly and easily cleaned, keeps both food and water clean, and almost every one who keeps chickens has the cans within reach. Fifteen minutes' work at the nearest tin-shop, will give one half-a-dozen of them, which will answer the purpose intended as well as any that can be bought.

A. M. HALSTED.

Rye, N. Y.

"DOES IT PAY?"

WAS ever an undertaking proposed involving any expense of labor or money where this question was not asked? I had occasion to ask it last fall and will tell the RURAL readers about it. I was walking over the grounds of a friend with him, and my attention was drawn to the large number of little chickens just then feathering out. I asked how it happened that he had so many late chickens? He said he didn't get as many as he had intended to. I opened my eyes at this and he explained. These chickens in his warm house

grew rapidly and well all winter, were ready for market early in the spring, even before chicks hatched in January and February, and were sold at the top of the market. Many of the pullets would lay a dozen or more eggs before their turn came to die. He says they cost him less per pound than any that are hatched before May first. He evidently has faith in his business, as his fall chicks will eat three tons of corn-meal from the time they are hatched until they are sold. This, at $17 per ton, will be $51 for winter feed on an experiment, as many would call it. For my part, I will this year set my hens as often as they wish to sit, up to September 1st, and try my friend's plan and see "how 'tis myself." Who else will try the same? A. M. VAN AUKEN.

HENS WANT COAL ASHES.

Not having had an opportunity to get oyster shells enough to supply our hens, we have been giving them coal ashes with the cinders left in, and have been surprised to see how much they will eat. They eat the charred portions. We have a great deal of confidence in the instinct of animals. They know what they want. Our hens, 50 of them, eat a panful of coal ashes every day, notwithstanding they have lime before them all the time. F. D. C.

Dairy Husbandry.

THE RAISING OF CREAM.

T. H. HOSKINS, M. D.

WITH all your readers, dear RURAL, I cannot but feel under some obligation to Mr. O. S. Bliss for yielding (notwithstanding the heavy pressure of other duties to which he refers) to that "sense of duty to the dairy interest" which has impelled him to write the interesting paper in which he exposes the fallacies of my article upon cream-raising. To one who knows, as I do, the exacting nature of Mr. Bliss's duties as a vice-president of nearly every dairy organization on the Continent, the pressing demands of his great dairy farm, etc., etc., the obligation so incurred is greatly enhanced. But the pressing cares to which he refers have caused him to forget some items, both of science and of fact, which I will beg a little space to mennmention. Mr. Bliss intimates that I am ignorant of physical science. In a paper with which I am editorially connected I recently permitted him, without remark, to speak of me as "a writer who insists upon occupying positions directly in conflict with all the well-established laws of physics." I did so, because I thought I could safely allow my readers to judge between us on that point. To the larger circle of RURAL readers I might do the same, were I equally well known to them; and I will here only say that a full college course of earnest study under a teacher of such eminence as to have been lately raised to the seat rendered vacant in the French Academy of Sciences by the death of Sir Charles Lyell (Prof. J. Lawrence Smith, of Louisville, Ky.,), to say nothing of years since spent in study and labor in the same field, *ought* to qualify me in some degree to treat a physical question of even such acknowledged intricacy as the one under discussion.

First, Mr. Bliss says, "there is no such thing as 'cream-rising.'" He might with equal truth say that there was no such thing as balloon rising. The laws involved are the same in both cases. According to Mr. Bliss's idea (I will not say theory) a balloon could not rise in still air. It would be necessary to create currents in the atmosphere in order to get up the balloon.

Mr. Bliss speaks of me repeatedly as a theorist, with the object of insinuating that my views on the subject are a mere hypothesis. I certainly have a theory (*i. e.* a rational explanation) regarding the matter, but it is based upon carefully studied facts, developed by a course of experimentation which I explained in detail at a recent meeting of the Vermont Dairyman's Association, in Mr. Bliss's presence and subject to his questions. Replying to one of these, I distinctly stated that I had seen the cream rise perfectly in my apparatus where the milk was kept at the temperature at which it had when drawn from the cow. Mr. Bliss says, "it will not do it." This approaches omniscience.

My critic says, "the theory that currents in milk obstruct the raising of cream is in direct conflict with the facts," and in the next sentence he says, "cream is raised by the effect of gravitation, *but not when the influences affecting the law are conflicting*," (italics mine) Here seems to be that sort of self-contradiction which comes from lack of clear thinking, excusable in Mr. Bliss's case by the pressure of business under which he wrote.

That a long-continued agitation of milk will induce a condition of the fluid in which entire separation of the cream by gravity, when it is finally left at rest, is rendered difficult or impossible, is certainly no argument against my "theory." There are probably still other causes, physical and chemical, that will have a similar effect. My "theory" applies only to normal milk. I agree with Mr. Bliss that under no conditions so far secured, can *all* the cream be brought to the surface and retained there. The fine oil (butter) globules remain suspended under any condition of stability in the fluid practicable to be obtained. This in large-globuled milk is so slight as to be practically of no importance, while in small-globuled milk it is a decided advantage for cheese-making, to which that class of milk is best adapted.

The difference between buttermilk, the residuum of butter made from entirely sweet cream and sweet skim-milk, quite manifest to the senses, (and to which Mr. B. refers), is both a mechanical and a chemical one. As usually found, such buttermilk contains small masses of butter, which affect its taste as they come in contact with the palate. The agitation of churning, by promoting extensive contact with the air, also generates a slightly acid condition, even in the sweetest buttermilk, evident both by tests and to the sense of taste.

In regard to the relation of the law of specific heat to the rising of cream, Mr. Bliss, in a confused way, seems to adhere to the original mistake made about it, which Dr. Sturtevant, in his manly way, at once acknowledged when the facts were brought to his notice by a correspondent. It is an unquestionable fact that so far as this law acts at all, it acts directly against the idea that cream rises best in a falling temperature.

Mr. Bliss says, "The theory that cream is carried down by the descending currents is untenable," and again, referring to my explanation that cold setting is effective because it is setting at a uniform temperature, "this statement is wholly untenable." Dogmatism is not argument. But it is quite true, as found in practice, that the more quickly the newly-drawn milk is put in the cans, and the more quickly it is brought to the temperature of the water, the more quickly and perfectly the separation of the cream is secured. And this entirely agrees with, in fact, confirms my "theory."

As to the climax which Mr. Bliss finally finds to be capped in my statement, that the sole point to be observed in practical cream-raising is the abolition of currents in the milk, and which he thinks he renders absurd by saying, that "until Nature's laws are suspended, no cream can be raised without both an upward and a downward current in the mass," let me suggest to him a little experiment. Let him string half-a-dozen small beads, each upon a string by itself with a knot in the end. Let him deposit the beads in the bottom of a tall glass vessel, having the threads drawn straight and secured to a cross-piece resting on the open top of the vessel. Then let him fill the vessel with alternating layers of differently-colored sand. Then let him slowly (cream is from four to 12 hours in rising) draw the beads to the surface, pulling directly upwards. What will he find on examining the sand through which the beads (representing butter globules) were raised? Has there been any mixing of the layers? Has there been anything more than a slight lateral to-and-fro motion of the particles of sand as the beads passed slowly upwards? Just so it is in the rising of cream; only, in place of the upward drawing force exercised through the strings, we have the force of gravity which presses (through the particles of the milk) upon the butter globules, and they in turn press upon the milk. But as the butter globules are the lighter, they do not press so strongly as the milk in the downward line, and so they are, as it were, extended upwards as we extrude the seeds from a grape by pressing it between the thumb and finger. There is, necessarily, no motion in the milk particles except the lateral one, to and fro, as the butter globules pass along, and a settling together of the whole mass equal at last to the thickness of the layer of cream that accumulates on the surface—the milk occupying the spaces before occupied by the globules. I feel I have taken too much space for this article, yet it is really important that the true mechanics of cream-raising should be understood, however much it may be to the interest of some individuals to muddle the facts.

CATALOGUES, &c., RECEIVED.

WHAT NORTHERN MEN SAY OF THE SOUTH.—This pamphlet of 63 pages contains the proceedings of the Convention of Northern residents of the South, held at Charlotte, N. C., Jan. 15th, 1879; also letters giving individual expressions of opinion and facts relative to products per acre, social life in the South and a good deal of miscellaneous information with regard to the South and its people. Although, of course, the views herein given are a trifle one-sided, yet it would be well for all intending to immigrate to the South to send for this pamphlet, and learn what settlers from this section think of the country. It will be furnished *gratis* on application to N. Dumont, Charlotte, N. C.

QUARTERLY REPORT of the Kansas State Board of Agriculture for the quarter ending March 31, 1879. This pamphlet of 77 pages also contains much useful and interesting information relative to industries, population, etc., etc., by counties. Alfred Gray, Sec'y, Topeka, Kansas.

BULLETIN OF AMERICAN Berkshire Association, Springfield, Ill. This is the first number of a neat periodical of 30 pages, devoted to the interest and record of this fine breed of swine. Price, $1 per annum; edited by P. M. Springer, Secretary of the Association at Springfield, Illinois.

LIST OF PREMIUMS, ETC., for the Oregon State Fair, to be held on the grounds near Salem next Sept. or Oct., as shall be decided by the Ex. Com. in June; 154 pages. E. W. Waite, Sec'y, Salem, Oregon.

FOWL BREEDER'S GUIDE and Descriptive Circular, from E. E. Hardin & Co., Scotia, N. Y., giving full details as to breeding, etc., as accomplished on their experimental farms.

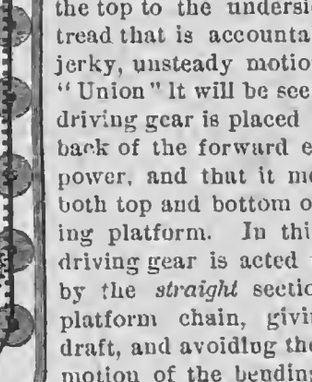
PROGRAMME of the Seventh Annual Exhibition of the Inter-State Industrial Exhibition, to be held at Chicago from Sept. 3 to Oct. 18. J. P. Reynolds, Sec'y.

REPORT of the Committee of the Georgia State Agricultural Society, at its convention held at Hawkinsville, Feb. 18-20, 1879.

Industrial Implements.

RECTANGULAR AND BOX CHURNS.

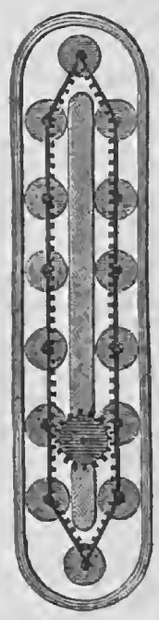
AT the International Dairy Fair held in New York last winter, Western dairymen won some twenty-one premiums on butter. Eighteen of these prize exhibits were made in the Rectangular and Square Box Churns Messrs Cornish & Curtis, of Fort Atkinson, Wis., who make them have introduced the Churns very successfully. Starting with Whipple's Rectangular Churn, they addded a lever butter worker, then the square box churn, and are now doing an extensive business in all three. The Rectangular has met with as much favor in factories and creameries as in farm dairies, and been spoken of by practised dairymen as being a very satisfactory churn. We have used



the butter worker on our Experiment Farm during two seasons. As we are very particular, not to say hypocritical, in such matters, this fact is indicative of our appreciation of the worker. The Churns have no internal machinery, the cream is precipitated from corner to corner, or side to side with a concussive force that is likely to develop every grain of butter in the fluid. More particular information may be had by applying to the manufacturers direct.

UNION RAILWAY POWER.

WM. L. BOYER & BRO., of Philadelphia, Pa., have a horse-power that combines many excellent points. A recent inspection of the machine has led us to illustrate the device for overcoming the tension on the moving platform as it passes around the ends. It is the uneven tension at the points where the platform passes from the top to the underside of the tread that is accountable for all jerky, unsteady motion. In the "Union" it will be seen that the driving gear is placed somewhat back of the forward end of the power, and that it meshes into both top and bottom of the moving platform. In this way the driving gear is acted upon only by the *straight* sections of the platform chain, giving steady draft, and avoiding the irregular motion of the bending end sections. As the bottom, or returning sections are at the same time propelled *up* the inclined track and around the front end there is little wear or friction, or loss of power expended by the animals in getting the platform into position to transmit their power to the motor. It may be worth mentioning that the chain links and wheel bearings are hardened, reducing the chances of the links wearing and consequently lengthening, or the axles wearing, large faults that soon disable a machine. There are several sizes of this power made, particulars of which may be had on application.



THE English trade journals are very sedulously urging the importance of reorganizing the patent-laws, reducing the costs especially. It is claimed that the fees required to fully secure an invention amount to prohibition.

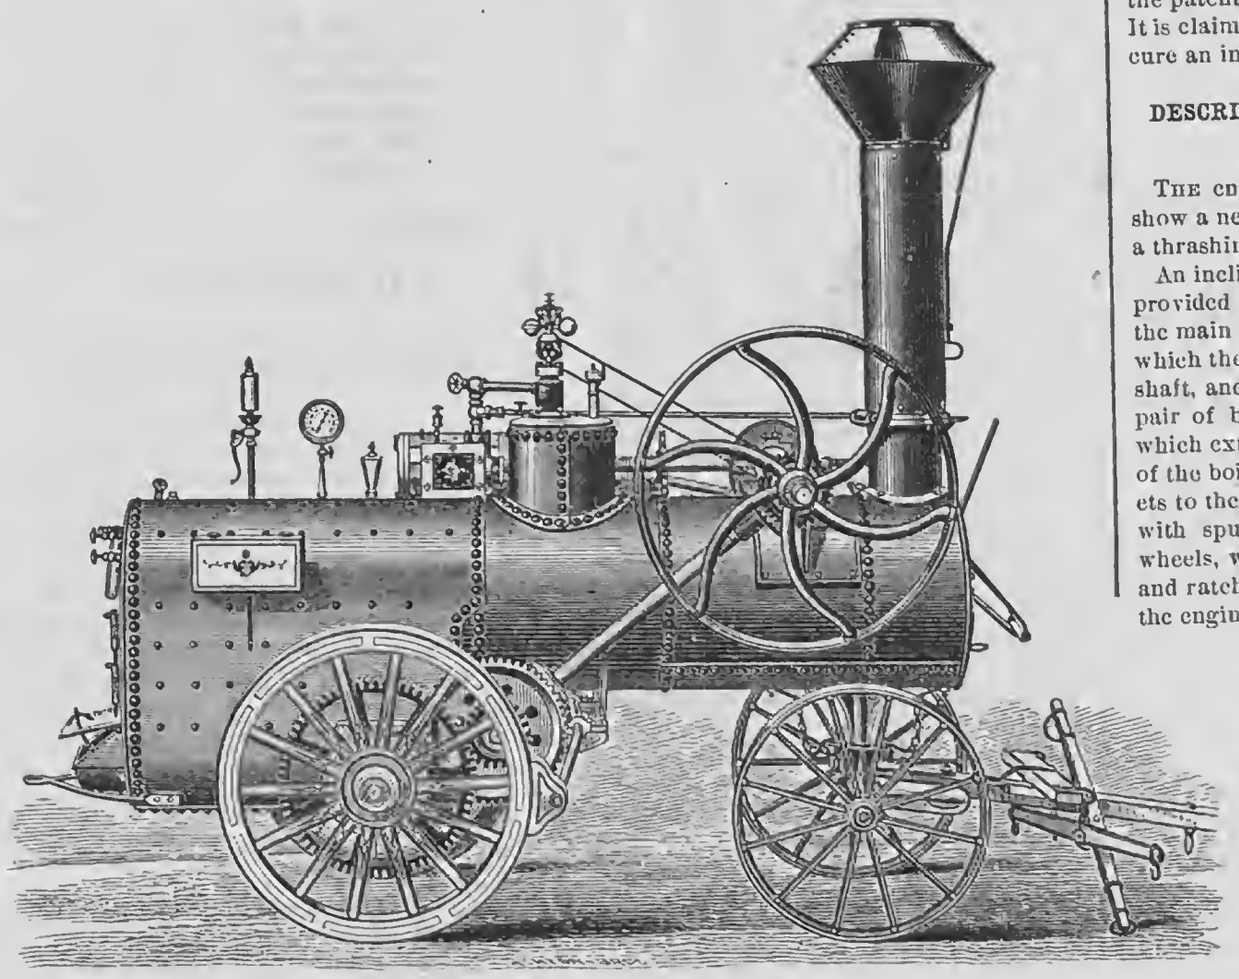
DESCRIPTION OF A NEW TRACTION ENGINE.

THE engraving we give, has been made to show a new traction attachment applicable to a thrashing, or farm engine.

An inclined shaft on the side of the boiler is provided with bevel wheels at each end. On the main shaft is also a bevel wheel through which the power is transmitted to the inclined shaft, and from thence—by means of another pair of bevel wheels—to a horizontal shaft which extends across and under the cylinder of the boiler. This shaft is attached by brackets to the fire-box, and at each end is provided with spur pinions which drive large spur wheels, which are connected by suitable pawls and ratchets to the hubs of the hind wheels of the engine.

The bevel wheel at the upper end of the inclined shaft is held by a "feather," or fixed key, and two set-screws, and can be quickly thrown in or out of gear by these means. Whenever the engineer desires to use the traction attachment, he merely slips this bevel wheel up into gear with the bevel wheel on the main shaft, tightens up the set screws, and is ready to apply the whole power of the Engine to the driving wheels.

This device has proved itself equal to all practical requirements. Messrs. Nichols, Shepard & Co. of Battle Creek, Mich., have perfected this attachment for use on their thrashing engines, and this season it will be included in the outfit if the purchaser so desires. The engine itself is thoroughly well made and has, among thrashermen, become very popular. Circulars may be had on application.



NICHOLS, SHEPARD & CO.'S NEW TRACTION ENGINE.

Everywhere.

EXPERIENCE WITH SEEDS OF FREE-SEED DISTRIBUTION IN FLORIDA.

I HAVE delayed writing to thank the RURAL for its gift of seeds, not because we did not appreciate them, but because I thought I would report our success with some of them at the same time, knowing that a report from this quarter must be in advance of any from colder climates.

THE BEAUTY OF HEBRON potato we planted, and from the pieces raised nineteen hills. They did not do as well with us as the Early Rose; the potatoes were smaller though a little earlier, and, I think, superior in taste; but we do not consider it a good test, as Irish potatoes do better here on new land, and our land has been under cultivation for ten years. Next fall we intend to send North for more seed and give them a trial on new land.

OF VOORHIS WATERMELON we have five hills, some of them in bloom. The vines are looking better than any others we have. The favorite melon here last year, was called the Iceland. The seed was brought from Pittsburg, and they produced some immense melons. This is a great watermelon country.

THE BLUNT CORN we planted about the 5th of April, and nearly every seed came up; but the birds pulled some. I counted to-day 99 good stalks, some of them were 18 inches high. My husband says he never saw corn grow so fast, although it is on a very poor piece of land. We have but fifteen acres under cultivation, and the other crops were nearly all in when the corn came, so, in order to put it where it would be least likely to mix with the other corn, we had to take a poor place; but we will try to make up in fertilizing and cultivation, for we are anxious to get a better variety than any raised here. The sort grown here only averages one ear to a stalk, and a small one at that.

THE PEARL MILLET we did not know how to plant, so my husband drilled in some of it, and some he planted in hills. When we learned from the RURAL that it would not make seed in that way—and seed for another year is what we want—we thinned it out to one seed in a hill; I could not bear to have it wasted, so I transplanted some of it, just to see if it would live. We had no rain for a long time after it was transplanted and I supposed it would all die. To-day, however, I have been looking at it, and, to my astonishment, found two-thirds of it growing. I have put one plant in the middle of my nasturtium bed which I had made very rich, and I hope to astonish people with it after a while.

THE FLOWER SEEDS have not been very successful with me. Some of them I could prevail upon to grow, and some I could not. Perhaps it is because I am so much interested in the farming operations that my flower-garden has had to suffer somewhat in consequence. I have some very fine plants of the Hibiscus militaris; a few of the Hollyhocks; some Columbines, and two nice little trees of the Pinus edulis. As this is a pine tree country, I think they will do well, perhaps. I have saved some of most of the seeds, to try again after the hot weather is over.

THE ACME TOMATO I had nearly forgotten to mention. We planted the seeds at the same time we planted those of Gen. Grant. Plants of the latter are in bloom, but the Acmes are not, though the vines are looking thrifty. We had to leave them in the seed-bed too long, on account of its being too dry to transplant them. We had scarcely any rain here all through April. In Illinois everything would have been dried up with so little rain and such hot weather, but here the heavy dews we have every night, keep things growing.

REMARKS.—It is splendid cotton weather, they say. We have a little cotton, sugar-cane and rice, all of which are looking well. We are only farming a little while waiting for our orange grove to grow, but what we do, we are anxious to do in the best way, and to test the capabilities of the soil and climate to the utmost. The soil here is very poor, and will not pay for cultivation without plenty of manure. Our land never had any at all, until we began to cultivate it. We do not buy commercial fertilizers, but keep horses, cows, goats and chickens, all the manure from which is carefully saved and mixed with black muck. We also keep a compost heap into which we throw everything which we think will be of any use to the land. I keep a leach for liquid manure. My husband says it is my hobby. I always used it a great deal in my flower-garden in Illinois, and I find it of great value here.

Starke, Bradford Co., Fla. MRS. J. S.

RURAL SPECIAL REPORTS.

FLORIDA, Tallahasse, May 6.—As information from all sections is in order I "drop a line" not to catch fish, (by the by, our lakes are full of them), but to say thus far we have had a most delightful spring. Oats are good; corn is doing well; gardens are superb and cotton, now being hoed out, promises to be all right. The "Pearl Millet" seed sent us, I find to be what every farmer here has been raising all the time, and we would as soon think of doing without the never-failing "Collard Patch" as our little field of "Cat-tail" Millet so-called, as it resembles when reaching maturity the Cat-tail Flag of Western New York. In our warm climate but few kinds of green food can be given to horses and mules during plowing season without danger of sickness. Big, or Cat-tail Millet, while it is nutritious, is perfectly harmless. We plant it about March 1st in rich ground, stalks six inches apart. When eight inches high, we cut it two inches from the ground. The oftener you cut it the faster it will grow. Cultivate sufficiently to keep down grass and weeds, and render the ground soft. With us it will bear cutting six times during the summer, and seed plentifully in the fall. There is money in furnishing seed here at $2 per bushel. Whoever cuts it for hay, will do a losing business. I would not give one dollar a ton for it when dry, except for the manure bed. The Acme tomato proves to be the "Large Red Smooth." We have for the past four weeks been luxuriating in Irish potatoes, green peas, beets, snap beans, and lettuce, and will in a fortnight have plenty of tomatoes—and when I see by the papers that Cayuga Lake was frozen over April 8th—I wonder who would not live in Florida.

A SUBSCRIBER.

MISSOURI, Kingston Furnace, May 10.—This whole region is suffering for want of rain. Oats are doing miserably, and many acres will be turned under and corn substituted. Much corn will have to be replanted. It is cold as well as dry. Wheat on the uplands is injured; in the bottoms it still looks well and is almost ready to head out. There are no peaches, except a few on very high land. Apples bid fair to make a crop. There are some cherries. The winter killed the grape buds, above the snow, of the Ioua, Delaware, Herbemont and Catawba. Clinton, Concord, Norton's Virginia, Ive's Seedling, Cunningham, Hartford Prolific and Taylor's Bullet do well here under ordinary vineyard culture; but Iona, Delaware and Catawba make no growth and do no good under like treatment. Taylor's Bullet will do to cover arbors or trees and its fruit is delicious.

N. W. B.

BAILEYVILLE, Ogle Co., Ill., May 9.—The weather is very dry and cold here; nights frosty; unfavorable to vegetation. Crops are suffering, especially the late-sown spring wheat and barley and oats, which have been injured by recent frosts. Grain seeding was about all finished by the 25th ult., and corn planting began on 29th, and now a large amount is planted; nearly all in this section will have finished planting by the last of this week. Unless rain comes soon, all crops will be light. We have had no rain for a month, except a very light shower on 24 ult. and another on the 3d inst., but not enough either time to "lay the dust." Cherry and plum trees commenced blooming here by the 1st of May and are full of blossoms; but I think most of the tender varieties of fruit are injured by frost and will fall off. W. B. D.

TEXAS, San Antonio, May 4.—Our drought was broken on the 22d ult., and in three days there fell six inches of water. It came with a sufficient moderation to penetrate the earth, but we were nearly deluged. There was no damage done, however, except a little washing of crops. Three days before the rain a fire swept over thousands of acres, licking up every spear of grass, green or dry; but after the rain, in eight days, the grass was three to six inches high all over the burned stretch. Crops, early planted, look well. Some corn is knee-high, while in other parts of the same field, folks are just planting. Watermelons, muskmelons, etc., are blooming, but they are late owing to the spring drought. M.

NEW YORK, Pitcher, Cheuango Co., May 12.—The weather here is cool and very dry. Grass has started but very little as yet. We have to feed our cattle almost as regularly as in winter. The old land-marks of winter have not all been removed, as there is occasionally a snow-bank to remind us of what we have had to encounter of late. Small grain is mostly sowed; many are planting potatoes, while some think they are growing much faster in the cellar than they would be in the ground. I don't know of anyone that has ventured to plant corn yet. Produce is very low; butter, 12c.; eggs, 10c. per doz.; potatoes, 75c. per bushel; oats, 35c.; maple sugar, from 7 to 10c. per pound. L. W. S.

CANADA, Fernhill, Ont., May 9.—The weather here is very cold and dry. With a few exceptions we have had very hard frosts every night until date. Trees are showing very few signs of greenness. Peaches are badly damaged in this neighborhood. Bees have done very poorly this spring and winter; very many were frozen to death, and others died of diarrhea; but they are doing better now. Hay will be a very poor crop unless we soon get some rain, of which all crops are in need. A great many have started in the grazing business in these parts, but the prospects for success now look very slim.

J. M. W.

VIRGINIA, New Market, Shenandoah Co. May 9.—We are having a very dry season here, the ground having been too wet for cultivation only once since March 1st. Farmers have finished planting corn; fruit trees of all kinds have already blossomed. The prospects for plenty of all sorts of fruit are fine. Weather pleasantly cool, with slight frosts. Wheat 95c. to 96c; corn, 45c. to 50c; butter, 10c; eggs, 8c; bacon, 8c. to 9c.

P. S. W.

NEW YORK, North Lawrence, May 9.—The birds came in good season this spring, but the snow-banks remained till the end of April. The weather is cold and raw most of the time, yet some have planted potatoes; but if the seed escapes rotting, most likely the plants will be injured by frost. A new creamery opened here to-day, and another, about three miles away, will open next week. A. H.

MICHIGAN, South Lyon, Oakland, Co., May 12.—Wheat is not looking as well as usual at this time of the year. The Fly thinned many fields, and cold, dry weather has held what is left in check. Buyers are paying to-day 99c. per bushel for wheat, and many are waiting for the even dollar. Corn is plentiful at about 40c.; oats, 30c.; potatoes, scarce, at 75c.; store hogs are again in demand. Fat steers bring 4½c. per pound; butter, 10c.; eggs, 7c. A. B.

NEW YORK, Harris Hill, Erie Co., May 10th.—Early-sown wheat looks well; late sown, however, looks badly. Stock of all kinds look well. Farmers in this vicinity are all about through sowing. Farm products are as follows: Wheat, 97c.@$1; barley, 65c.; corn, 42c.; oats, 32c.; butter, 14c.; eggs, 12c.; and yet we are more hopeful in the future.

B. F. S.

ILLINOIS, Dear Park, La Salle Co., May 10.—Weather cold and dry. Had frosts the first five nights in May, with no rains for the previous month. Corn planting in full swing; but the ground is so dry that much of the seed will not germinate until rain comes. Small grains look sickly and grow but slowly. The prospect for small fruit is good; but apple trees are almost without blossoms. U. S. E.

PENNSYLVANIA, Muncy, Lycoming Co. May 12.—Spring is very backward here; fruit buds are just opening out. There is a prospect of an abundant fruit crop of all kinds this season. Most of the corn is planted. I think there will be a large area planted to potatoes. Wheat does not look promising—too dry. R. F. S.

ILLINOIS, Wheaton, May 12.—The weather has been very cold and dry for some weeks, with frost every night until within the last three or four days. Since then, however, there has been a warm change and planting is progressing rapidly. O. F. S.

ALABAMA, New Market, Madison Co. May 9.—Corn is 10 inches high and looks well. Fine prospect for crops of all kinds. Fruits, however, are many of them killed; but vegetables are abundant. Strawberries are ripening. G. D. N.

ILLINOIS, West Derby, Starks Co., May 9.—Weather cold and dry; nights frosty. Apples and cherry trees are gay with blossoms, but I fear the cold weather has blighted a good deal of the fruit. Farmers are busy planting corn, of which a large area has already been planted.

H. E. MC'C.

The Querist.

ANSWERS TO CORRESPONDENTS.

Concerning Sheep.

B. F. C., Elkton, Ohio, asks, 1, whether fine-wooled and coarse-wooled sheep do well together, or should they be kept separate; 2, should breeding ewes be "grained" during gestation; if so, what kind of grain and how much of it should they have; 3, at what time of the day should it be fed to them; 4, when wool is 30c. per pound, and corn 40c. and oats 25c. per bushel, will it pay to feed stock sheep the year round; 5, how often should sheep have salt, or should they have access to it all the time; 6, what is the best remedy for foot-rot; 7, with Spanish sheep which will pay the better—to wash the wool on the sheep's back or to shear without washing; 8, what is the best time for shearing sheep.

ANS.—1. As different breeds require different treatment, they should be kept separately. 2. Breeding ewes in lamb should by all means have a little extra food, half a pint of rye, corn and oats mixed in equal proportions for each day may be useful. 3. At noon is a convenient time for feeding grain, but any time may be chosen, being careful to maintain regularity in the feeding, else much of the benefit is lost. 4. It will not pay to keep sheep without pasture; cheap land and grazing are necessary for profit in sheep keeping. 5. Once a week at least; they may be supplied continually, if the supply is regular and sufficient. 6. Paring the hoof and removing all dead bone and dressing the diseased parts with blue vitrol. 7. It is more profitable to sell the wool in the grease without washing; usually the deduction for unwashed wool is less than the loss of weight by washing. 8. As soon as the settled weather arrives; one hot day does not make a summer, it must be remembered. Full information on these and other points are given in Stewart's Shepherd's Manual.

Treatment of Corns in a Horse.

M. A. B., Springfield, Mass., has a horse whose usefulness and value are seriously impaired owing to lameness due to corns contracted three or four years ago. Blacksmiths say they can shoe him so as to prevent the lameness, but have always failed to do so and he asks what can he do for the animal.

ANS.—Corns in a horse are different from those on the skin of a human being. They are first produced by blows or bruises which start inflammation and formation of matter under the sole, or cause a deposit of horny matter which presses painfully upon the sensitive inner parts of the foot. They are frequent in flat-footed horses, the frogs of whose feet have been pared away so as to bring the sole to the ground and subject it to continued bruises from stones. The usual mode of shoeing is one that protects the tender spots on the sole from blows in traveling. This is to put a shoe of sole-leather under the iron shoe and stuff under the leather with tow soaked in glycerine to keep the sole cool and moist. If the sole is very tender, the feet should be prepared for shoeing by keeping them upon a puddle of wet clay for a few days, and by frequent dressings of cold water and by giving the horse a cooling medicine, as eight to twelve ounces of Epsom salts.

Sore Eyes in a Horse.

A. H., North Lawrence, N. Y., has a horse with sore eyes, which are attributed to the sunlight streaming in through the large high windows on the east side of the stable, the manger being on the west side. To modify the light a cotton screen has been used, but this is considered injurious by neighbors, and our opinion is asked as to the cause and treatment of the malady.

ANS.—The trouble is not the result of the sunlight or heat; in all probability it is due to the strong ammoniacal vapors which are frequent in all stables. The best place for a window in a stable is on the north side, and if possible the stalls should be so arranged as to have the sunlight in front of the horse. A side or rear light is bad, but not so much so as to irritate the eyes. If the light has that effect in the stable, it would be worse out-of-doors. We would suggest that the window be covered with lime-wash, in which some indigo is mixed, to give it a deep blue shade; that the stable be kept free from pungent scents by sprinkling plaster freely over the floors and upon the litter; that the horse's eyes be bathed in a solution of five grains of sulphate of zinc twice a day; and that a pinch of burnt alum be blown into each eye through a quill once or twice daily to start a suppurative discharge before the zinc is used.

Stocking a Fish Pond.

H. B., Greenville, S. C., asks the cheapest and best way to stock a mill pond with fish, and whether the pamphlet lately published on fish culture by L. L. Polk, and noticed in the RURAL, would give helpful information on subject.

ANS.—What kind of fish? The proper kind depends upon the character of the pond and the temperature of water. If the pond is supplied by springs and the water is cool, black bass might be kept in it: if the bottom is muddy and the water warm, perch, either white or yellow, will thrive in it; carp is a pond fish and a good one. All that is necessary is to first determine what kind of fish can be kept successfully in the pond and then procure a supply of live fish of that kind from streams, other ponds, or dealers, to stock the water. Commissioner Polk's pamphlet gives a good deal of useful information on most branches of fish culture. Write to him, at Raleigh, N. C., for it.

Applying Guano to Corn.

J. M., Saltsburgh Pa., asks which is the better way to apply guano to corn—to sow it broadcast or put it in the hill.

ANS.—In sowing guano it is dangerous to place it close to the seed, lest the tender shoots be injured by the corrosive nature of the fertilizer. If a small quantity only is used, a teaspoonful for instance, it may be scattered in the hill, a little earth dropped on to it, and the seed then sown. If 250 pounds or more are used per acre, it would be best to sow it broadcast and harrow it into the soil before planting.

Rural Flower Exchange.

Mrs. J. G., Forest Grove, Washington Co., Oregon, and quite a large number of others, ask about the RURAL Flower Exchange, or send communications intended for that Department. To all such we regret to have to say

that we were obliged to discontinue our "Exchange," as we ascertained that, in some instances, the names thus procured were used for trade and other purposes. The necessity for the discontinuance of the Department is regretted by us as much as by our readers.

Ensilage.

C. A. L., Warren, Ohio, asks us to describe what is meant by the word Ensilage, and to furnish him through the RURAL with a plain description of the process.

ANS.—Our friend is referred to the RURAL of February 1, for full particulars. Briefly, the following are the important points: The word Ensilage is used to designate the method of preserving fodder in a pit. Corn or any green plants used for fodder may be preserved during winter by burial in such pits. The system was discovered by one Auguste Goffart, who has since become quite distinguished therefor in France. His plan perfected, as he claims, only after many years of experimentation, is to dig pits or trenches, called silos, in the earth, so situated that the rain can not enter. The sides are plastered with cement, and the pit covered as air-tight as possible. The stalks are first cut into half-inch bits, so that they may be placed more compactly in the pits and so as better to exclude the air. They should be placed in the pit as compactly as possible, indeed, the exclusion of air is that upon which the value of the ensilage chiefly depends. When filled, a couple of inches of short straw are spread, and upon this close-fitting boards are placed crosswise so as to be removed one by one as the silo is vertically cut down. Upon the boards heavy weights are placed to preserve the density of the material underneath.

Management of Hen Manure.

A Subscriber—no address, asks, 1, whether hen manure which has been wholly or partially exposed to the weather, is of any use; 2, how is that which has been saved under cover best applied in the garden in the absence of muck which is recommended for tempering it; 3, how is it best prepared for use as liquid manure; what proportion of water should be employed in making the latter; how often should it be applied and what is the best time of day for doing so; 4, would it be good for cabbages and potatoes; 5, how can a new iron kettle used only for heating rain water be prevented from rusting.

ANS.—1, It is still of some use, the value depends upon the amount of exposure and loss thereby. 2. It may be sown broadcast and harrowed or raked into the soil. 3. Put one pailful in a barrel of water and use the water in the usual manner for watering plants in the evening after a rain, if the weather is dry double the water. 4. Yes. 5. Grease the kettle thoroughly until the iron has absorbed all it will; then scour it thoroughly and it is fit for use.

Remedy for Sheep Scab and Ticks.

L. S. M., Wyandotte, Kan., asks for information concerning scab and ticks in sheep, and the best means of getting rid of the pests.

ANS.—In the RURAL of May 17 will be found an illustrated description of the parasite that causes sheep scab. We have found Buchan's Cresylic Sheep dip most effective in the treatment of scab, as also of ticks. It is sold in a concentrated form in small packages, and can be used conveniently. A strong solution is made by mixing one pound of the "dip" to five gallons of water. It gives no pain to the animal and is not dangerous to handle. In treating for scab, the parts should first be softened and the dry scab removed by washing in soap-suds. Then apply the dip. After shearing, the ticks go from the sheep to the lambs. If the latter are dipped twice, it will rid them of the pests. There should be a week's interval between the dippings.

Oyster Shells as a Fertilizer.

R. F. S., Muncy, Pa., has several barrels of oyster shells which he wishes to use as a fertilizer and he asks whether it would be better to burn them or get them ground in a plaster mill, and then on which crop would they have the best effect, potatoes, corn, strawberries, tobacco or grass.

ANS.—Oyster shells consist almost wholly of carbonate of lime; nothing is practically lost by burning them into lime and much is gained in the cost of preparing them for use. As they are nothing but lime when burned, they are not of much benefit to any crop but grass.

Miscellaneous.

J. M. W., Fernhill, Ont., Canada, asks, 1, the names and prices of the best works on the following subjects: 1, sheep husbandry; 2, cattle; 3, horse furriery; 4, he describes a climbing shrub and asks its name; 5, and the best time to bud trees; 6, also, when should pearl millet be planted to mature seed; 7, and why doesn't the RURAL reach him regularly.

ANS.—There are several excellent works on some of these subjects, and whichever we might name as the best, many, with good reason, would prefer some other. We shall not, therefore, decide which is best, but merely mention those likely to prove satifactory: 1, Stewart's Shepherd's Manual, $1.50; 2, Allen's American Cattle, $2.50; Youatt and Martin on Cattle, $1.00; 3, Coleman on Pathological Horse-shoeing, $2.00; Miles on the Horse's Foot, 75c.; Stonehenge on the Horse, $2.00. One of the most comprehensive and lucid works on the diseases of stock is Law's Farmer's Veterinary Adviser, $3.00. All the works can be had through this office. 4, Send specimen; we cannot name the shrub from the meager description. 5, The proper time for budding trees differs with the sort of trees. Mention the kind, and we'll name the time. 6, Pearl millet will not mature seed in that latitude. 7, The RURAL is mailed from this office regularly every Tuesday to all our subscribers, and if it fails to reach its destination, the fault must rest with the P. O. folks.

Implements and Machinery.

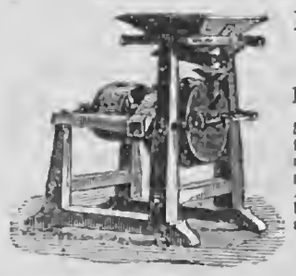
A GOOD SAW-MILL for $188.

Our No. 1 Plantation Saw-Mill is designed to be run by 8, 10 or 12 horse-power Agricultural Engines. With this power from

1,500 to 4,000 Feet

of lumber can be cut in a day; a product 25 to 50 per cent. greater than can be cut with any reciprocating saw-mill. The mills are complete, except saw, and will be put on the cars in Cincinnati for the low price of $188, and warranted in every particular. Saw Mills of all sizes, Engines and Boilers, Shafting, Gearing, etc. Illustrated Circulars sent free.

LANE & BODLEY CO.,
JOHN AND WATER STS.
Cincinnati, O.



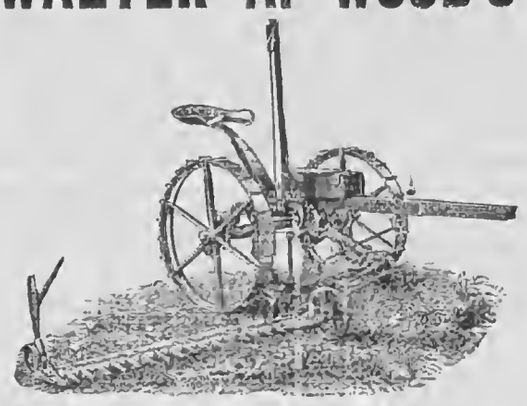
Mill Manufactory
Established 1851.
Grist Mills
OF
FRENCH BUHR STONE
Portable Mills for Farmers, Saw Mill Owners, etc. Price from $80 up. Complete Mill and Sheller $36. A boy can grind and keep in order. Adapted to any kind of suitable power. Complete Flouring and Corn Mill very cheap.
NORDYKE & MARMON CO.
Indianapolis, Ind.

AHEAD OF ALL COMPETITION
1879.

SEVEN SIZES FOR HAND USE.
Weighing from 32 to 51 lbs.
THREE SIZES FOR HORSE POWER.
The *complete victory* and highest awards at the exhaustive Field Trial at the Paris World's Exhibition in 1878, together with those at the great hundred-day trial at the Centennial in 1876, prove that these machines fully maintain their reputation as the best Lawn Mower yet made. Do not buy worthless imitations, when the genuine can be had for the same money.
GRAHAM, EMLEN & PASSMORE, Patentees and Mfrs.
631 Market Street, Philadelphia, Pa.
Send for Descriptive Catalogue with prices.

Implements and Machinery.

WALTER A. WOOD'S



New Enclosed Gear Mower.

ONE AND TWO HORSE.

For Simplicity, Lightness, Strength and Durability this Mower cannot be excelled. It is less complicated, easier to repair, and less liable to get out of order than any other machine. Its weight is reduced to a minimum consistent with maintaining the greatest efficiency in handling the most difficult crops.

WALTER A. WOOD'S
New Sweep Rake Reaper.

[2 Sizes—5 feet and 5 feet-6 inches, with and without Mowing Attachment.

with new Automatic device for controlling the rakes. This is the most perfect, lightest draft, and stillest running Reaper made.

Walter A. Wood's Chain Rake Reaper.
" " " Self-Binding Harvester.
" " " Headers.

Circulars and Price Lists sent on application. Made only by the

Walter A. Wood Mowing & Reaping Machine Co.,
HOOSICK FALLS, N. Y.

Branch Offices:
New York City, 31 Liberty Street.
Chicago, Ill., 80 Taylor Street.
Madison, Wis., 23 King St., Fuller & Johnson, General Agents.

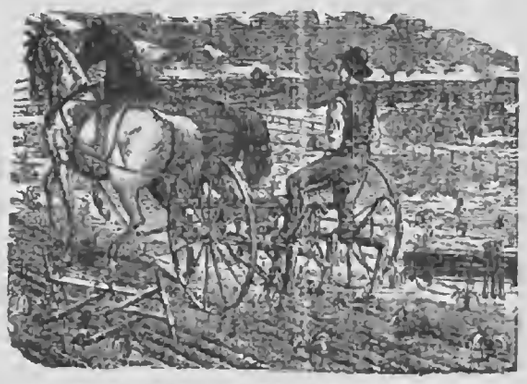
The Robbins Cultivator



AND BROADCAST SEEDER.

CHEAP! The Implement for the Times. CONVENIENT!

Adapted to almost every variety of farm tilling and seeding, and sold at less than the price of a Grain Drill alone.

THE ROBBINS is a two-horse riding or walking Cultivator, is especially adapted to breaking up fall plowing and fitting it for spring crops; for cultivating Corn, Potatoes, Beans, or any crop planted in rows or drills, the axle being set high enough to clear corn at the last working; for work on fallows, and for fitting any ground which would ordinarily require cross plowing.

It is provided with an accurate and reliable *force feed* seeding attachment, which sows all kinds of grains *broadcast*, in front of the shovels, in any desired quantity to the acre; and by gauging the depth at which the shovels are allowed to work, the grain can be covered as deep or as lightly as desired. Send for circular,

Manufactured by the
Robbins Cultivator Co., Jackson, Mich.
And for sale by dealers generally.
State you saw this in the Rural New-Yorker.

Implements and Machinery.

MONTGOMERY'S
IMP. ROCKAWAY FAN

Gold Medal at Maryland Institute and 15 First Premiums at other Fairs in 1878.

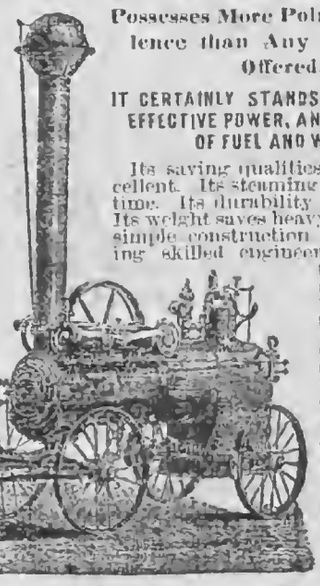
222 FIRST PREMIUMS.

15 SILVER MEDALS.

The most perfect and substantial Fan made. It will grade, separate and thoroughly clean any grain raised upon the farm, and has been victorious in every contest over most all Fans made. An ordinary farm hand can operate it! It will save its cost in one season. Responsible Agents wanted where not introduced. Address the manufacturers for price lists and circulars.

DORSEY, MOORE & CO.,
68 S. Calvert St., Baltimore, Md.

BIRDSALL ENGINE.



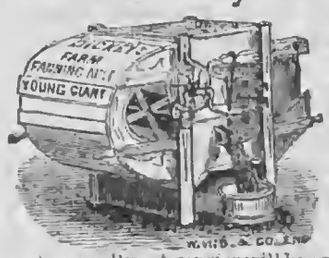
Possesses More Points of Excellence than Any Other now Offered.

IT CERTAINLY STANDS UNRIVALED IN EFFECTIVE POWER, AND THE SAVING OF FUEL AND WATER.

Its saving qualities are super excellent. Its steaming capacity saves time. Its durability saves repairs. Its weight saves heavy hauling. Its simple construction saves employing skilled engineers, and many times, much perplexity and vexation. The genuine material used in their manufacture saves breakages. The satisfaction they give saves jobs, saves money, saves reputation, and preserves the good will of all. Trial given in all cases before requiring payment. For special circulars address

E. M. BIRDSALL & CO.,
PENN-YAN, N. Y., or
248 JOHNSON ST., CHICAGO, ILL.

A. P. Dickey Fanning Mill.



The Best Fanning Mill in the World. Obtained Centennial Award and Grand Medal. It cleans perfectly Oats, Cheat, Cockel and all foul matter from Wheat and Barley. It grades and separates for Seeding and Market, cleans all kinds of small seeds, and will save any farmer its cost annually. Agencies will be established throughout the Middle States this season. Address

DICKEY & PEASE, Racine, Wis.

GRAVES' PAT. RUBBER TARGET GUN.

An entirely new principle.
Shoots Arrows or Bullets almost as straight as a RIFLE.
Adapted to all ages.

$1.50, delivered, free of cost, throughout the U. S. on receipt of price; or, sent by express, not prepaid, for $1.00. Clubs of six supplied with Guns at a low rate.

JOHN WILKINSON, Sole Man'f'r, 77 State St., Chicago.

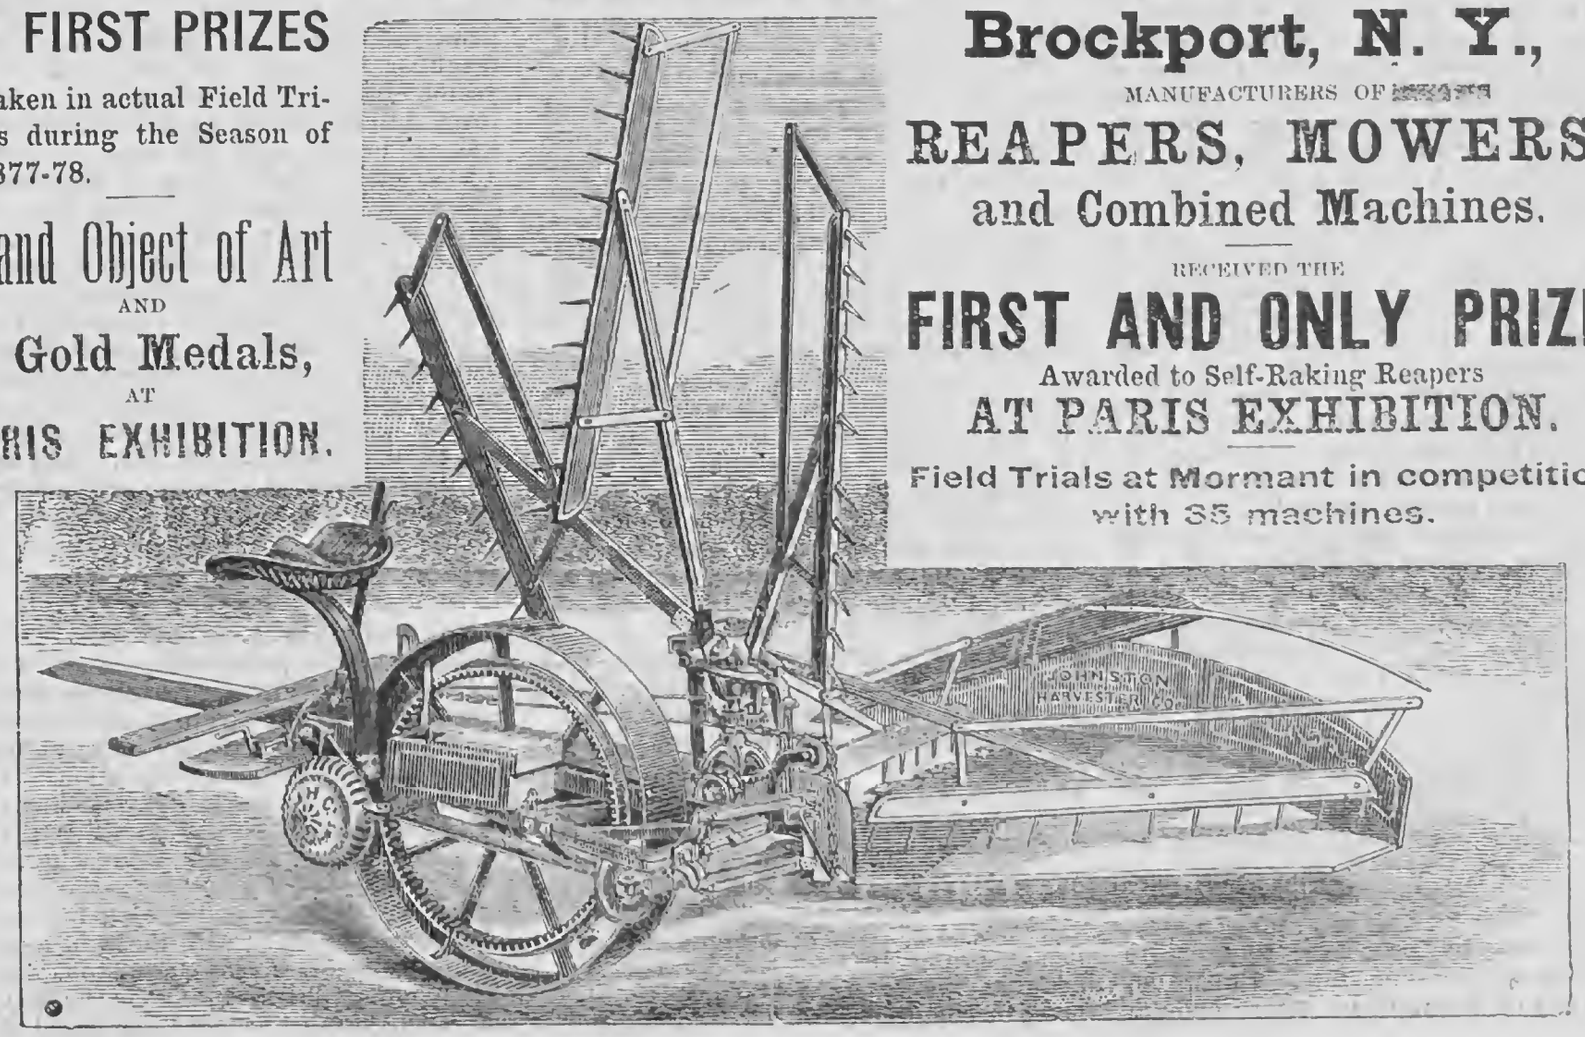
Send also stamp for my elegant New Catalogue of Scroll Saws, Lathes, Archery, Base Ball, &c. I have the best goods in market, and all at manufacturers' prices. I am publisher of Hopp's and Ware's Designs, and sole importer of the genuine "Wilkinson Saw Blades."

THE JOHNSTON HARVESTER CO.,

75 FIRST PRIZES

Taken in actual Field Trials during the Season of 1877-78.

Grand Object of Art
AND
2 Gold Medals,
AT
PARIS EXHIBITION.



Brockport, N. Y.,
MANUFACTURERS OF
REAPERS, MOWERS,
and Combined Machines.

RECEIVED THE
FIRST AND ONLY PRIZE
Awarded to Self-Raking Reapers
AT PARIS EXHIBITION.

Field Trials at Mormant in competition with 35 machines.

THE
RURAL NEW-YORKER.
PUBLISHED EVERY SATURDAY.

Address
RURAL PUBLISHING CO.,
78 Duane Street, New York City.

SATURDAY, MAY 24. 1879.

TO EVERY READER.

We respectfully and urgently call the attention of our readers to the *necessity* which exists that they should address their communications to the Editors or the Publishers of the Rural New-Yorker, if they would insure prompt responses. Letters addressed to individuals are often delayed in this office for weeks. Mr. Moore, to whom letters intended for us are still occasionally addressed, has had no connection with this journal for years.

HAY.

The much that has been said and written about the value of early-cut hay has unquestionably had its influence upon the practice of many, if not of all farmers. The current of opinion has been changed, and there are few who do not now hold, at least in theory, that early-cut hay is best, though some yet doubt its being, on the whole, the most profitable.

But no great step in advance can be taken in regard to a single matter without its being revealed that many other things must be made to keep step with it, in order that the expected benefit may be fully realized. The mowing machines called for smooth fields. The importation of improved domestic animals necessitated better housing, feeding and care. The new methods of setting milk for cream cannot yield their full advantage without more care in milking and in making butter. And so it is with regard to the early cutting of hay: before it can be put in practice with the surety of reaping all its advantages, we must abandon some old ideas and take in some new ones. We must cease to look upon the grass crop as a free gift of nature, and begin to regard it as a cultivated crop; one not to be stolen from the ground after a full yield of grain, but to be made a primary object in our culture, the same as corn or potatoes.

The proper complement and conclusion of the theory of early cutting are that we must have two, and sometimes three full crops of grass from the same land in one season. We can only get them by manuring and seeding for them. It is of no use to talk of early cutting and two crops upon land in such poor heart that the early quick-growing grasses, like June-grass and orchard-grass, cannot make a crop on it, and where timothy, weak and scattering, does not get strength to head out before the middle of July. On such land we must wait for the grass to "thicken up," or we shall not be able to see it after the machine has passed over the field.

There are farmers who say that June-grass is worth nothing for hay; and we have seen farmers cutting it at the rate of two tons to the acre the first week in June. It would be a good thing to bring these two kinds of farmers together in a farmers' club, and have the latter tell the former how it was done. Orchard-grass and clover will usually be fit to cut about June 12, and all that will dry on the ground may be grown on it, if one knows how. Directly adjoining such a crop, with only a board fence between, on land equally good by nature, we have seen about six spears of timothy to the square foot struggling with sorrel, daisy and five-finger, all together making perhaps one-third of a ton of "good horse hay" to the acre about the last of July. It was of no use to talk to the owner of that field about early cutting, for there was nothing there to cut early.

In the good old times, before mowing machines, tedders and horse rakes, it would have been cruelty to talk about two or three hayings in one summer. But now that the handling of grass is reduced to so small an item, there is no difficulty about it, if we can raise the grass. Can we do it? Is it "all humbug" to talk about carrying a herd of 25 cows on the feed of a 50-acre farm? We know a practical dairyman who keeps that number on 25 acres, but he soils instead of pasturing them. There are thousands of farms better suited to dairying than his, yet we will not frighten our readers by proposing to them to stock up at the same rate. But we do think any of us might be smart enough to make 50 acres carry a herd of twenty-five, if we would only make a study of the subject. It will take manure to do it, and knowledge and skill as well.

No farmer that wastes all or half the liquid manure of his stables, will even make hay at the rate of four tons to the acre. Nor will he do it by the usual routine of seeding timothy and clover with grain. An old colored brother was once observed fishing from the long bridge at Washington, and throwing overboard everything he took except the bull-heads, or what they call cat-fish. On being asked why he threw back the bass and other fish he answered. "Well, you see, boss, when I goes a-catting, I goes a-catting." We must be inspired with this old man's method, a little more intelligently applied, if we want to be eminently successful growers of grass. The objective point on all dairy and stock farms should be grass, and every process of the farm should have the grass crop in view above everything else. When we have learned how to grow four tons of hay in two or three cuttings, we shall all be "early cutters," and late cutters, too. On moist meadows we shall still grow single crops of timothy, red-top and fowl-meadow grass; on all arable upland we shall learn the value of rye-hay, oat-hay and Hungarian, as well as of clover and of fodder corn properly grown for forage; while on our permanent mowings we shall learn what June-grass and orchard-grass can be made to do by the use of manure and primary seeding—that is, seeding without grain. There are lands of an intermediate character, moist and and rich, yet well drained naturally or by art, where two heavy crops of timothy may be cut every season. It is just as true that we go over too much ground for our grass as that we do the same for other crops. But the change in either case is not so easily made. We do not exactly believe what we read about it; we have too few visible examples for our encouragement and instruction. Yet we ought to perseveringly experiment in this direction. Those of us, especially, who are perforce "small farmers" with our ten to fifty acres apiece, must try to learn how these things are done, and surprise our big neighbors with our big barns filled with big crops from small areas of ground.

MAKE THE AGRICULTURAL COLLEGES EXPERIMENTAL STATIONS.

The agriculture of the nation has reached a stage in its development where the need of scientific facts upon which to base its further progress, has become not only apparent but eminently pressing. Solutions of many puzzling questions, and facts that may guide to more assured success, are loudly called for by our agricultural and horticultural societies, by scientific men, and by all progressive tillers of the soil. They call for experiments that will determine the best methods of breeding and feeding stock, and that will throw the needed light on obscure questions in grain raising, in pomology, and in gardening. Experiments, too, are needed to develop more effective methods of culture and prevent our running in ruts. Agriculture is no longer restricted simply to plowing, sowing, and breeding cattle, but it also includes the knowledge of how and what to breed and plant in order to receive the best possible returns from our efforts.

How can this knowledge be best obtained? The people naturally look to our Agricultural Colleges for answers to all questions of an agricultural interest, but too often they are disappointed. It must be remembered however, that it requires capital to experiment. Under the very economic (?) management of the State Legislatures, many of the colleges are barely able to exist as educational institutions, to say nothing of the carrying out of extended and expensive experiments. Experiments are, indeed constantly under way in many, perhaps, in all the colleges; but these institutions being pinched for want of means, their efforts in this direction must necessarily be limited. The question has occurred to us, would it not be true economy and prove a universal blessing if the respective State Legislatures should establish and maintain an experiment station at each Agricultural College? What an amount of effective work might then be accomplished! Thirty-seven States have availed themselves of the land grants of Congress; think of as many stations, not only teaching what is already known, but constantly searching for new facts, revealing new truths and testing new methods! What encouraging progress might then be made! Stations have, indeed, sprung up here and there in the country, but to be of much value they must be comprehensive and thorough-going in their labors, and this, of course, requires means. Many of the colleges offer all the facilities that can be desired. By no other plan could experiment stations be so cheaply maintained and so effective in their work. The needed land is already connected with the schools, few having less than 200 acres, while many have 600 or more. The ordinary farm crops are raised by most of them, and stocks of different breeds kept. A force of scientific men is already connected with each institution, and the young men who will probably in future take a prominent place in the ranks of agriculture are there congregated. It would be well that these should have the benefit of carrying out extended experiments in the business in which the life-time of most of them will be passed. Systematic experiments thus carried on, under the direction of competent men, each station communicating with the others and all having a central guide in the Department at Washington, cannot fail to confer on American agriculture an impetus that is yet undreamed of.

VIRTUE IN WORK.

Work ennobles; luxury enervates and demoralizes. This is the verdict of history, awarded in every notable case in which the question has arisen. Simplicity of life and honorable industry have ever brought forth a condition of private and public virtue, have produced comfort and every desirable aspect of wealth, with contentment and happiness. It is curious to note the change which has occurred of late years in the condition of the people both in the agricultural and other industries, not only in our own country but in Great Britain—the greater condition of luxury and expensive living which now exists and the painful turmoil of grumbling and dissatisfaction with present circumstances. At home we are complaining that business is very bad; that farming no longer pays; that expenses eat up profits; that produce sells for nothing and that, on the whole, everything seems to be going to the bad.

Abroad the same occurs, but to a greater degree. In England agriculture is in desperate straits. Every week a hundred or more farmers are published in the official "Gazette" as bankrupts or insolvents. Ground between the millstones of high rents and high wages, under the operation of the effects of ruinous competition with cheaper American products, the English farmer is in a sad plight. And now comes Joseph Arch, who is the prophet of the period in this case, and who says, "farmers must return to the old-fashioned and homely beer, in place of the new-fangled costly wine; must dismiss the piano, and put their daughters to the churn as in the olden time, in order to revive agricultural prosperity." And the "Jeremiad," although bitter to think of, seems to point to the only course which can be pursued.

Is there no food for reflection for Americans in this? Not long ago, we traveled in the West for a day in company with an agent of an extensive manufacturer of parlor organs. He was returning suddenly and unexpectedly, having already taken more orders for instruments than his firm could make in a year to come. His customers were Western farmers. Every family required an organ, and the principal reason was because the next neighbor had one. All were sold on a year's credit. The young ladies who learned to use these instruments doubtless no longer milk the cows or manage the dairy; spin the wool from their fathers' flocks; knit the family hose, or rarely make their own dresses. One luxurious habit, especially if it causes work to be thought inconvenient or degrading, leads further and becomes disastrous in the end. The young men, too, require a fast horse and a costly wagon and more expensive attire; and then the help of a hired man in the field is as needful as that of the help in the kitchen. And under the pressure of all these self-inflicted taxes, farming does not pay, and it is to be feared that it never will until these taxes are repealed.

Agricultural Education.—It is evident that, to equalize the production of our various industries, agriculture must soon receive an impetus in some shape or other. This must certainly come in the way of a better technical education. It requires as good a man in every way to make a successful farmer now-a-days as to make a lawyer, a doctor, a preacher or an engineer. Yet if we compare the numbers or the students in the law, medical or theological schools with those in agricultural colleges, what a contrast is offered! We must learn this lesson, namely, that our boys must be as well prepared for the first of all professions, viz, that of agriculture, as for any other, and that the farmer who lavishes all his spare income for some years on John to make a preacher or a lawyer of him, and keeps James at home with no more than the simplest rudiments of school knowledge to make a farmer of him, does this boy the gravest injustice. And yet in spite of this, James will probably be called upon to assist John in after years to maintain his station of assumed superiority! It may be that this division of the paternal resources may be thought equal, and that the inherited farm may be considered an equivalent for the cost of the college education. But it is an injustice that a young man should be left unprepared by sufficient education to make the most of his resources in after life, and this idea should be kept so prominently before the public as to lead in time to the perfection of a system of agricultural education in the public schools and the thorough utilization of the agricultural colleges.

The Preservation of Timber.—An easy and simple method of rendering timber unusually durable, if not practically indestructible, is of the greatest value to the agricultural community. Fence posts, sills of buildings and other timber exposed to influences which cause rapid decay, last but a few years under ordinary circumstances. It has long been known that lime is an effective preservative, acting in this way by coagulating the albumen in the cellular tissue of the timber. An easy method of preparing the timber has been applied practically by a French mining engineer. A pit was made in which the timber was placed; quick-lime was scattered over it and then slaked with water. After being exposed a few days to the action of the lime, the timber was removed and used as supports for the roofs of a mine. Where unprepared timber lasted but two years, that prepared in this way has been in use for several years without the least appearance of decay. This method of preservation commends itself for its simplicity and cheapness for farm use.

General Information, as a test of qualification in our public-school teachers, is almost wholly left out of the examination by School Commissioners. This is a very grave omission. Only broad, well-informed minds are fitted to mold the plastic minds of children. Teachers, who have only a routine knowledge of the common school branches, without any proper understanding of the history and progress of their age, are quite incapable of imbuing the young mind with a desire for knowledge. The inspiration of the teacher often lifts the child's mind to a higher plane, and gives an impetus that is felt through life. The profession of the common-school teacher sadly needs elevating; and this higher standard must be introduced by the School Commissioners, into whose hands the qualification of teachers is committed. Farmers are greatly interested in this, and they should look to the character and qualifications of the Commissioners whom they elect.

BREVITIES.

Verbenas are now selling in this city at 50 cents per basket, containing one dozen of assorted colors.

One of our most prosperous farmers is that particular as to the tidiness of his barn, that soiling the floor with tobacco juice is strictly prohibited.

Professor Cook tells us that thoroughly rectified benzine, poured into all suspicious crevices, is the best remedy for bed-bugs; as may be seen in another column—a useful bit of information in summer-time.

We have never seen the Japan Quinces so loaded with flowers as now. These are fine shrubs and groups of the white, rose, red and deep-red—blooming as they do at the same time—form brilliant objects upon the lawn.

Feed the young chicks often—bread wet with milk is as good as any food for them. Give them clean water twice a day in clean, shallow vessels. Flower-pot saucers answer the purpose nicely.

Without plenty of live stock, says Mr. Mechi, fed on purchased foods, and, in addition, some purchased manures, there is very little hope for the British farmer on ordinary soils in competition with the foreigner.

Artificial Tallow! Now that artificial butter has been made from tallow, it is in order that the tallow should be produced artificially so that consistency may be preserved. This has been effected and a patent has recently been granted for making tallow from a mixture of 60 pounds of castor oil, 10 pounds of animal fat, 10 pounds of vegetable oil and 20 pounds of wheat flour. Perhaps no one will object, much less the juveniles who would rejoice if all the castor oil in existence were disposed of in this way and the product were used by the artificial-butter factories.

Literary Miscellany.

THE ANDRE MONUMENT.

Mr. Cyrus W. Field has purchased the land at Tappan, where Major Andre was executed October 2, 1780, and is having prepared to be placed on the same, a stone, on the front of which will be inscribed:

Here died, October 2, 1780,
Major JOHN ANDRE, of the British Army,
who, entering the American lines
on a secret misson to Benedict Arnold
for the surrender of West Point,
was taken prisoner, tried and condemned as a spy.
His death,
though according to the stern code of war,
moved even his enemies to pity,
and both armies mourned the fate
of one so young and so brave.
In 1821 his remains were removed to Westminster Abbey.
A hundred years after his execution
a citizen of the States against which he fought
placed this stone above the spot where he lay;
Not to perpetuate the record of strife,
But in token of those better sentiments
Which have since united two nations,
One in race, in language, and in religion;
With the earnest hope that this friendly union
Will never be broken,
[*Arthur Penrhyn Stanley, Dean of Westminster.*

[*On the back.*]
Supt lacrymæ rerum et mentem mortalio tongunt.
[*Virgil, Æneid*, 1, 462.

[*On the left side.*]
"The spy of the neutral ground,
Who died as he had lived,
Devoted to the service of his country."
[*Fenimore Cooper.*

[*On the right side.*]
"He was more unfortunate than criminal;
An accomplished man and a gallant officer."
[*George Washington.*
"He died universally esteemed and universally regretted."
[*Alexander Hamilton.*

AN UGLY GIRL.

(Continued from page 286.)

CHAPTER XVI.

THE PHANTOM.

It was neither easy to pacify the trembling Irene nor to discover what had thrown her into such a state of alarm; but when the lamps had been lit, and she sat close to her brother, with one hand in his, the other in Hillian Gray's, and Mrs. Hurst's comely, sympathising face beaming upon her, she regained her courage.

"Yes, I dare say it was foolish of me to be so easily frightened," she said, in reply to one of Noel's rallying speeches; "and yet I think I had cause for my fears."

"No doubt; but was that cause anything more terrific than a spider or a rat?"

"Indeed, Noel, it was, as I told you, a human figure—or what looked like one—that I saw in the library."

"Or thought you saw," he hastily made answer, though the recollection of what he had himself beheld in that apartment, made him give more credence to Irene's tale than he chose to admit. "I dare say there are ghosts innumerable in this old house; headless knights, and ladies in flowing robes, besides a skeleton or two that haunt some special chamber, and generally make their appearance about midnight—'that witching hour when churchyards yawn——'"

"Oh, don't, Noel! If I thought there were an atom of truth in what you are saying," the pale Irene protested, "I would go back to mamma rather than remain here! Do talk common sense, and leave the ghosts alone."

"Certainly, if you will set the example," her brother promptly replied; "but when you rush into the room, startling Miss Gray with a wild story of supernatural appearances, I think it is only kind to supply you with a little corroborative evidence. I may have seen your ghost myself. Describe her.

But Irene, who did not like his raillery, unceremoniously turned her back upon him, and addressed herself to Hillian.

"Do they say that spirits haunt this house, Miss Gray?"

"I have not been here long enough to learn the legends of Carlsforde," was the amused response. "But surely, dear Irene, you do not place any faith in such idle nonsense?"

"N-no," she answered, in very hesitating tones—"at least, I never have done so; but when one has such extraordinary adventures oneself, who can help feeling a little—just a little credulous?"

"May we hear what this adventure was?" asked Noel, who was really curious to know whether his sister's experiences coincided with his own; "or are you bent on raising our expectations to a tremendous pitch, only to lower them again with the confession that it was a stray cat or a screech-owl that drove you here with these white cheeks?"

"If you would leave off making fun of me, I would tell you directly," she pouted. "I had gone into the library more than an hour ago to find some engravings I wanted to show you, and in turning over the folio I came upon a copy of those verses Miss Gray quoted last evening. I don't care much for poetry: but these were so stirring, that I had a fancy to learn them: and, carrying the paper to one of the windows—for the light was beginning to fade even then—I laid it on the cushioned window-seat, and knelt down to read them over and over till I had committed them to memory."

"Well?" queried her brother, finding that she had paused. "What are you pondering over?"

"I am trying whether I can remember any of the lines," said Irene naively; "I'm afraid not, for I forgot them in watching the men who are clearing away the rubbish from the foot of the tower, and scarcely thought any more of my verses till they had put on their jackets and gone away. Then I should have resumed the task I set myself, if I had not heard a sound like the rustle of a woman's dress at the other end of the room."

"Do ghosts wear silken robes that rustle? Aren't you clothing your spiritual visitor in rather substantial garments?"

"Be quiet, Noel, and let me finish. At first I thought it might be Mrs. Hurst, come to remind me how I was neglecting you; she is the only person here who wears a silk dress; but then she always has shoes that creak, and walks heavily, whereas, this person's footsteps were inaudible. So I peered round the arm-chair that hid from me the further and duskier end of the room, to see who it could be."

"Ah! now your narrative really grows interesting," muttered Noel, who knew that whoever this person might be, she had shown herself to Irene in the same spot where he had beheld her some weeks previously.

"Do you mean this, or are you ridiculing me?" his sister doubtfully inquired. "I assure you, Miss Gray, that there was the figure of a woman dimly to be seen at that end of the library, and my first impression was that it must be you, and that you were in search of me."

"Go on," cried Noel, impatiently. "Miss Gray was here—just returned from a walk to the village."

"I knew she had gone out on one of her errands of mercy, but forgot it at the moment, and said carelessly, 'I am here; did you want me?' As soon as I spoke, the figure uttered a stifled cry, and disappeared."

"In what manner?" asked Noel, still veiling his deep interest in the subject under a semblance of amusement. "Did she fly through the keyhole?"

"She disappeared," repeated Irene, emphatically; "but how, I cannot tell you; for there is neither door nor window near the spot where she stood. Am I quite sure of this? Yes; and Miss Gray will tell you the same; and yet the figure was there one moment, and the next it was gone. Its disappearance was so sudden and extraordinary, that I was seized with a panic, and rushed here."

Noel asked no more questions, for Mrs. Hurst was demanding to know what had happened; and he sat reviewing what he had heard till his sister and Hillian, by their united efforts, had contrived to give her the required information.

"I daresay it was one of the women servants who had gone in to close the shutters before it grew later," was the good lady's comment on the tale told her. "They are silly, timid creatures, afraid to move about the house after dark, and Jane or Hannah would be quite as much startled by your sudden appearence, my dear, as you were to find some one in the room."

"Let Jane or Hannah explain how she vanished from my sight, and I shall believe this," cried Irene, incredulously.

"Miss Gray does not give us her opinion on this extraordinary occurrence," Noel observed, and Hillian started from a reverie.

"Is not Mrs Hurst's explanation the most feasible one? I cannot imagine that any person would be so wicked as to secrete him or herself in the library for the purpose of terrifying Miss Estcourt."

She spoke with a little impatient scorn of the terrors which it was evident that she did not share, for she offered to go with Mrs. Hurst and make a close and careful examination of the room; very sensibly observing that it would not be prudent to mention Irene's adventure to the domestics, who were already quite superstitious enough to attach greater weight to it than it merited.

No one likes to be laughed at, and the male sex are proverbially averse to anything in the shape of ridicule; therefore Noel was careful not to reveal to either of his fair companions that he firmly believed all Irene had asserted. He was not weak enough to imagine that there was anything supernatural in the vision; but that there was some mode of entry to the library beside the legitimate ones, and that it was used by the female he and Irene had beheld, he was firmly convinced; and he chafed at his inability to descend thither and search the paneling for the spring that enabled the unknown to glide in and out with such bewildering rapidity.

As Irene confessed that she still felt nervous enough to dread sleeping alone in the large and rather isolated chamber she occupied, Hillian generously offered to give up to her the pretty little room adjoining and communicating with Mrs. Hurst's.

The offer was thankfully accepted, and at the usual hour for retiring, the house was closed, and Noel, who now refused any other attendance than that of one of the men-servants who slept close by, was left to repose. But he was more than commonly restless, for he could not feel satisfied until he had obtained some more tangible explanation of the occurence in the library.

Could it be Miss Carlsforde herself whom he and Irene had seen? Was it possible that there were secret apartments in the house in which she was secluding herself, and thus contriving to be perfectly cognizant of all that was passing under her roof, while supposed by everyone to be miles away?

For some time Noel felt inclined to adopt this solution of the mystery; yet when he came to reflect, he saw that it was an untenable one. However closely Miss Carlsforde might confine herself to her place of concealment, it would be impossible for her to be within these walls without taking some one or other into her confidence. She would require food and attendance; and, more than this, a motive for such seclusion was altogether wanting.

It could not be to avoid her kinsman; he was still a prisoner to his chamber, and she was mistress here, free to receive or decline the visits of anyone else who might be disposed to invade her solitude. No; Miss Carlsforde's reluctance to take advantage of the will that disinherited the male heir might induce her to quit the Park altogether, and keep the place of her abode secret until she attained her majority; but it could not have induced her to play these ghostly pranks. In fact, such levity would have been very ill-timed in a house, where her father had so recently expired.

Must he then believe that Mrs. Hurst was in the right, after all, and that the strange apparition twice seen in the library was due to the accidental intrusion of a servant? No: he could not do this, until he had found out in what manner the woman contrived her sudden flight; and he lay regretting his inability to personally investigate the matter, till fatigue weighed down his eyelids and he sank to sleep.

CHAPTER XVII.

ANOTHER ALARM.

The voice of Irene entreating him to awake aroused him from his brief slumbers, and he started up to find his sister, wrapped in a dressing-gown, her hair lying disheveled on her shoulders, standing by his bedside.

"What does this mean?" he asked, for she was trembling excessively. "Are you ill, or have you suffered some fresh alarm?"

"The library," she panted, in a hoarse whisper; "some one is there. Who can it be? Oh! Noel, I wish we were safely away from this dreadful house."

He did his best to calm her, and partially succeeded; for when he began to question her more closely, she was half ashamed to be obliged to confess how very small a foundation she had for the terrors that had brought her back to his room.

"Hillian insisted that I should have her chamber, which was very kind," she said; "and I was glad enough to make the exchange, as my room is so far away from you all; but Mrs. Hurst is the loudest sleeper I ever heard, and kept me awake till I grew so hot and uncomfortable with my restless tossings to and fro, that I crept out of my bed to shut the door of communication. Before returning to it, I drew the curtain aside to look at the sky, and saw that my casement faced those of the library on the other side of the quadrangle. You are listening, Noel?"

"Of course I am. Pray continue."

"Well, then, as I stood there I assure you that I saw a light suddenly appear in those windows."

"May it not have been your fancy? A ray of moonlight, perhaps."

"The moon is not shining to-night; and it was not fancy," Irene persisted. "I saw the library suddenly illuminated as plainly as I now see you; and while I stood fearfully gazing at this light—for I knew everyone in the house had gone to rest long before—a shadow was thrown on the window nearest to it."

"The shadow of a man?" asked her brother, excitedly.

"I could not tell. The person whose reflection I saw appeared to be clothed in long, shapeless garments that resembled nothing so much as a shroud. Oh! Noel, it was horrible! What can the creature be that haunts Carlsforde? Will it come here, Noel?" and she cast a fearful glance around her, and crept closer to her brother. "If it approaches me, I shall die with terror!"

Noel, whose arm was thrown around her, gave her a little shake, and spoke sharply; for she was growing hysterical.

"Pshaw! you foolish child! What would harm you? There are plenty of people at hand to protect you from burglars; and their visits are all we have to fear. Calm yourself, and help me to discover who this intruder can be. Try to remember what attitude the figure you saw yesterday evening had assumed when you caught sight of her."

"She was standing in front of an old-fashioned cabinet, in which Mrs. Hurst once told me that some of the family jewels are kept."

This information had an electrical effect on her auditor. Seizing the silver bell, with which he was accustomed to summon the servants in attendance upon him, Noel exclaimed, with a little triumph in his tones:

"Ha! now you have given me the clue I wanted! It is to obtain possession of the contents of that cabinet that the library is secretly visited, and your wakeful night may enable us to frustrate the would-be robbers."

Jephson, a quiet, elderly man, shuffled into the room, yawning and rubbing his eyes, expecting nothing more than a request for some lemonade; but his drowsy aspect vanished when Noel eagerly imparted such strange tidings.

"I am afraid there are thieves in the house, Jephson, and that their object is to possess themselves of Miss Carlsforde's jewels. They have made their way to the library, where the cabinet stands. Miss Estcourt has fortunately discovered this in time. She tells me that the room is lighted up; they are even now busy there. Haste and arouse the rest of the servants; but be cautious as well as quick, lest these scoundrels make good their escape. Ah! what torture it is to lie helplessly here, while others have the free use of all their limbs!"

Almost before he had finished speaking, the startled Jephson hurried away to carry out Lord Carlsforde's directions, while Irene, sobbing and shivering with unconquerable dread of a regular conflict between the burglars and their would-be captors, rolled herself up in one of the bed-curtains, and hid her face on her brother's shoulder every time she heard the slightest sound.

"Some one comes!" she gasped, presently. "If it should be some dreadful ruffian, how are we to protect ourselves?"

But it was only Hillian Gray. She had heard the servants pass her door, and had risen directly, imagining that Lord Carlsforde was worse, and her aid might be acceptable.

She looked surprised and incredulous when she heard the cause of the *emeute*.

"I cannot believe that anyone has entered the house. Rely upon it, you are mistaken. Mrs. Hurst always goes round it at night with one or other of the men, and satisfies herself that every door and window is secure."

"But what will you say, Miss Gray," persisted Noel, "when I tell you that I as well as Irene have seen a stranger in the library? You start; but it is true. On the night of the storm I beheld the figure of a person who is, I am satisfied, acquainted with the existence of some sliding panel or hidden door, which enables her to disappear with marvelous celerity. I firmly believe that she is now availing herself of her knowledge to introduce her confederates—base wretches, perhaps, who have deliberately planned this robbery."

Hillian's face began to lose its composure.

"You shock—you terrify me, Lord Carlsforde. What would they steal? The family jewels? I had forgotten those. What shall I do? This excitement is not good for you, and I—and I——"

She wrung her hands as if overwhelmed at the thought of her own inability to render any efficient service; but her agitation was not so great as Irene's, who screamed aloud as voices and the tread of many feet were heard on the stairs.

However, it was only Jephson and the two footmen, who had armed themselves with pokers, and now came to report that there was no one to be found in or near the library, and that everything there was in precisely the same condition as when it had been left on the previous evening.

Noel, stupefied by these assertions, looked at his sister, who, seeing herself suspected of romancing, began to declare vehemently that she had not been mistaken; that she was as positive as ever that she had seen some one moving about in that room.

"There's not a creature there," Jephson reiterated, with equal vehemence; "and, begging your pardon, miss, there can't have been; for I locked the door myself before I went to bed, and as I left it then, so I found it five minutes ago."

"Except——" one of the footmen began, then paused again; but Irene, who was beginning to feel angry at the incredulity with which she had been heard, insisted on his proceeding.

"I was only going to say, miss, that one of the lamps seemed to me as if it had been lighted quite lately; for I happened to put my hand on it, and the oil was quite warm."

"Or you fancied so," interposed Jephson, gruffly. "People can't very well get in an' out of a library when the windows is fourteen feet above the ground, and doors double-locked, and the keys in my pocket, where I have always carried 'em since there has been valuables in that cabinet. Miss Estcourt has been dreaming, that's all. A touch of the night-mare, I'll be bound. I used to be subject to it myself when I was young, especially after hot suppers."

Irene looked angry, and her brother but half convinced; for he happened to know that Jephson's carefully-secured doors were not the only means of egress or ingress the library contained. It was Hillian who suggested a plan that satisfied all parties.

"If Lord Carlsforde still feels any uneasiness respecting the safety of the jewelery, will it not be as well for John or Mark to sleep in the library for the remainder of the night? To-morrow the cabinet can be brought up here. We shall all feel relieved to know that it is under his lordship's charge; for I have heard my aunt say that some of the ornaments deposited in it are heirlooms, and of great value."

Everyone agreed that this would be an excellent arrangement; nor could Noel dissent from it though he asked, rather bitterly, if they should not have chosen a more efficient custodian of a lady's jewels than himself.

But when Hillian Gray softly said that she thought Miss Carlsforde would be pleased when she heard that he had taken them under his own care, he felt glad that he had not rejected an opportunity, small though it was, of testifying to the unfortunate heiress his readiness to requite her hospitality by any services that were in his power.

Another half-hour, and those inmates of the house whom Irene's alarm had aroused returned to their slumbers; but Noel did not follow their example till dawn; and his sister must have been equally wakeful, for the first time he stirred he found her beside him, her face crimson with eagerness.

"At last!" she exclaimed. "I thought you would never open your eyes."

"Is it so late?" he demanded.

"Yes—no. It must be nearly eight o'clock; but I have been up these two hours."

"Indeed! I thought you detested early rising, Irene."

"Ah! yes, as a rule; but I was determined to examine the library thoroughly as soon as the footman who kept guard there had quitted it; and I have carried out my intention."

"Not a bad idea," said Noel, approvingly; "but have you made any discoveries?"

"You shall hear, and form your own opinion. One of the lamps—the one nearest the cabinet—had certainly been lit, for I picked up the tiny wax vesta that had been used for that purpose. Now, you are as well aware as I am that no one sat there yesterday evening; and when Mrs. Hurst visited the room after my fright she carried the small hand-lamp she generally uses."

"Go on," said Noel. "Whatever others may say or think, I agree with you in believing that some person or persons entered the library after midnight; but why or wherefore, we have yet to find out."

"That's my good brother!" cried Irene, giving him a hearty kiss. "It's a great relief to find that you think this for it is dreadfully aggravating to be doubted, and told that you have dreamed what you know all the while you saw plainly enough. But I have not finished my report."

"Ha! you discovered the secret of the hidden door!"

"Is there one?" asked Irene. "No; I found nothing but this, lying at the foot of the cabinet;" and she held towards him a small yellow envelope, which, when held up to the light, appeared to con-

tain a slip of paper, half written, half printed, that looked like a certificate. Upon the envelope was inscribed, in faint, feminine characters, "From my dearest husband, June the third, 18—;" and in one corner it was endorsed with the name of Ada Carlsforde.

Noel did not feel justified in examining the inclosed paper, and he carefully placed the envelope and its contents in his pocket-book, there to remain till he should find some opportunity of returning it to its owner.

"Then you don't think this of any consequence?" inquired Irene, who was impatient for his opinion. "You don't think with me that it must have been let fall by some one who went to the cabinet? I am positive it was not lying where I found it when I was last in the room yesterday afternoon."

Yes, Noel did agree with her, though he advised her to say nothing respecting the finding of this paper until he gave her leave to do so. He now felt tolerably certain that it was Miss Carlsforde herself who had visited the library, and, having been frustrated by the presence of Irene in the purpose, whatever it might be, that brought her thither, had returned later at night, and then removed from the cabinet certain papers or other articles she wished to have. But whether she was residing in the neighborhood, or actually in the house, he was puzzled to decide; and after pondering over the eccentricity of her conduct till Irene had tired of his grave silence and left him, he resolved to dismiss the subject from his thoughts till he could discuss it with Hillian Gray, whom he was half inclined to suspect of being in the heiress's confidence.

CHAPTER XVIII.

CLEMENT DUNFORTH.

Noel was still in too weak a condition to endure fatigue and excitement without suffering from the reaction; and Dr. Monson, when he paid his daily visit, found his pulse so high, that he peremptorily banished everyone but Jephson from his patient's chamber, till the sedative he prescribed had reduced the feverish symptoms.

If Noel had been left to himself, he would have rebelled against these restrictions, for this was the day Clement Dunforth had fixed for his visit to Carlsforde, and Irene's brother was extremely anxious to see the young man to whom the heedless girl had so hastily pledged herself. But Jephson who was an old soldier, and prided himself on never disobeying orders, guarded him so jealously, that not even his prime favorite, Hillian Gray when she came to the door with some flowers, was permitted to cross the threshold.

"Beg pardon, my lord," he said, when Noel declared that he must see Mr. Dunforth, if only for a few minutes: "but orders is orders, you know, and I had mine direct from Dr. Monson. He's commanding officer just at present, and I'm answerable to him; discipline must be observed, sir."

"If you will do nothing else, at least you can recall Miss Gray," the invalid urged.

"Very sorry my lord," said Jephson, "but it's 'gainst orders to let you talk too much, and you wouldn't be able to avoid it if I let a woman into the room."

"Don't speak disrespectfully of Miss Gray!" exclaimed Noel, sternly.

"Certainly not, my lord; she's a young lady I admire too much; and you'll never find we military men impertinent to the fair sect, my lord; but truth is truth, and there's no denying that, betwixt Mrs. Hurst, and Miss Gray, and Miss Estcourt, there is a deal more talking goes on in this apartment than is good for your lordship, with a broken leg, and a head that's been one mass of confusions; let alone that Dr. Monson forbids it."

After which harangue Jephson withdrew into the dressing-room, and left his patient to his own reflections.

Yet, vexed as Noel had been at missing Clement Dunforth, he was far from gratified to learn on the morrow that Mrs. Hurst had pressed the young man to remain at the Park till Lord Carlsforde was able to see him. Irene's suitor might be the most amiable of men, the most devoted of lovers; yet, until Noel had satisfied himself that he could welcome him as a brother-in-law, it was not pleasant to know that he was domesticated with her; and when Dr. Monson paid his next visit, his patient told him with such vehemence that he must be permitted to see Mr. Dunforth, that the surgeon consented to the interview, for he saw that he would do as much or more harm by forbidding, as by permitting it.
